The Modan Mfg. Co. of Cleveland, O., is now testing those patterns of its pedals in which any changes in construction have been made, by running them on the machine shown in the illustration. The machine was designed and built in the factory of the Modan company, and while extremely simple, it furnishes a test for the wearing qualities of pedals which is perhaps as near to practical riding tests as any mechanical means could be. Four pedals may be tested on the machine at one time, there being two belt-driven shafts, into the ends of which the pedals are screwed in the same manner as when being attached to bicycle cranks. From each pair of pedals is suspended a 50-pound weight by means of a strong belt. The machine is then run to 440 revolutions per minute, a pedal speed which on a bicycle geared to 76 is equal to

THE CYCLE AGE

about 100 miles per hour. The machine, being so simple and so easily constructed, furnishes very ready means for testing in a comparative way the wearing qualities of different makes and styles of pedals. The Modan Mfg. Co. states that its Banner, Rover, King and Professional pattern pedals have been run on the machine for 927 hours each and showed but little or no wear at the end of the run. The distance traveled is equal to that of a pedal on a 76 geared bicycle running 92,700 miles. The makers are now in a position to fill orders of any size without the least delay and will take season's factory orders and guarantee to supply the pedals on the dates specified.

#### AIMS TO SUPPLY ALL WANTS.

The recent purchase of the entire stock and business of the Manufacturers' Agents & Supply Co. of Chicago by the Excelsior Supply Co., also of Chicago, has more significance than that implied by the mere transference of the property mentioned. The Excelsior Supply Co. has taken, under a ten-year lease, a five story and basement building at 88 to 90 Lake street and is now fitting it up into what will be one of the most complete bicycle supply houses extant and which will furthermore be operated on a plan which is novel at least to the bicycle trade. Besides carrying a regular stock of standard parts and fittings, the Excelsior company will make it its business to sell to bicycle dealers, repairmen, manufacturers, large and small, anything that they may ask for. All orders, no matter what they may call for, will be filled without delays, admissions of inability to get desired parts or substitutions of similar parts for those requested. In other words, the Excelsior Supply Co. will from now on endeavor to be to the bicycle trade what it has for the past twenty-two years been to the sewing machine business. So carefully has the work of supplying sewing machine parts of all kinds and dates of making been systematized by this company that today it can fill the order

of anyone for any part of any machine made. The bicycle dealer and repairman have long expressed the desire for such a supply house in their business, and it is the intention of the company to fill this vacancy. If some out-of-town repairer sends for a crank with a slotted pedal pin hole for some bicycle of several years back, or if he asks for a pair of handle bars with an odd size of stem, he will have his order filled with the same promptness and accuracy as though he had ordered several thousand feet of Shelby tubing, which by the way will occupy an important place in the Excelsior company's stock. No orders for material of any sort will be turned down, none will be but partially filled, no back order sheets will be kept. The completeness with which the detailed work is being laid out is well illustrated by the fact that a small machine shop will be placed in the establishment for the purpose of making such minor parts as cannot be readily found in the market, but which are liable to be wanted in a hurry by the patron ordering them. The Excelsior company is staking its policy on the logical assumption that the buyers of bicycle material throughout the country desire to buy at one house as much as possible and that the house which can fill difficult orders will be the house that will get the easily filled ones. The building occupied by the company has been completely rearranged inside and will include, besides spacious stock rooms, cash buying departments, offices, etc., a finely furnished sample room for the out-of-town purchaser.

#### SANGER HANDLE BAR PATENT ALLOWED.

The Sanger Handle Bar & Plating Co. of Milwaukee has received notice from the United States patent office that the application for a patent on the Sanger adjustable handle bar had been allowed on December 31. All of the claims made in the original specifications were granted and the company is congratulating itself on its success in obtaining complete protection on its bar. The factory of the Sanger company is now running an extra large force of men both day and night and the production of bars is said to average 1,000 pairs every twenty-four hours. Most of the machinery used is automatic and all is new and up-to-date. The company has established distributing agencies in New York for the eastern trade, the bar being represented by Walter E. Lindsay & Co., 253 Broadway, and Case & Schlaudecker, 92 Wall street. The latter firm will handle all of the export trade as manufacturers' agents. Walter C. Sanger will be at the New York cycle show in the interest of the Sanger bar.

#### CONSOLIDATION OF MICHIGAN DEALERS.

Grand Rapids, Mich., Jan. 3.—The partnership of Studley & Jarvis, jobbers and retailers of bicycles, sundries and sporting goods for the past three years at Grand Rapids, Mich., expired by limitation December 31, 1898.

E. G. Studley is the oldest dealer in bicycles, sundries and sporting goods in Michigan, and Mr. Jarvis for several years prior to the formation of the partnership managed this department. They had the state agency for several years for a number of well known lines of bicycles, but discontinued the jobbing of bicycles a year ago, and have for the past season done practically an exclusive retail business on Cleveland bicycles, continuing only the jobbing of sundries, specialties and sporting goods. During the past season the firm marketed over 200,000 pairs of bicycle grips to the jobbing and manufacturing trade.

Mr. Studley has never given his personal attention to this business, being interested in other companies which required his attention.

The new firm, which has now been formed, are successors to this business and that of W. S. Daniels & Co., handling Hamilton-Kenwood bicycles, sundries, etc.

W. B. Jarvis and W. Smalley Daniels are the firm members and will continue the business, and are now remodeling and modernizing the store.

The new firm will continue the jobbing of bicycles, sundries and retailing of bicycles and sporting goods, continuing the Cleveland as their leader in the bicycle line. They will also continue their J. & D. leather grip business, having already secured contracts for over 130,000 pairs.

#### PARTS FOR JUVENILE CYCLES.

The Frazer & Jones Co. of Syracuse, N. Y., has issued a price list of parts for its Elfin juvenile bicycles. While the prices given are for the latest models, they will apply generally to similar parts on machines previously put out. The list embraces wheels, tires, handle bars, frames, forks—front and rear—hangers, cranks, crank axles and bearings, chains, pedals, seat posts, brakes, saddles, guards, and the component parts which make up the assembled groups mentioned. Orders for parts can be filled promptly and without mistake

if the party ordering will be careful to designate the desired parts by the same terms as those used in the price list, and to state year, model, height and color of machines for which the pieces are intended. If possible, it is also desirable that the number of the bicycle be given.

#### COMBINED LOCK AND SUPPORT.

The accompanying illustration shows a simple device for supporting and locking bicycles in the house, store or club. When in use, the barrel of the pedal rests between the forks of the stand and the lock is then sprung on, fastening automatically. The stand holds the bicycle firmly at a slight

THE CYCLE AGE

inclination from the perpendicular. The finish is in black enamel and nickel. The patentee and maker is William H. Hart, Jr., 242 Chestnut street, Philadelphia.

#### SPRINGFIELD ONE-PIECE HANGER.

The Springfield Drop Forging Co., Brightwood postoffice, Springfield, Mass., is making a specialty of its crank hanger which has cranks and axle in one piece. The detachable sprocket has a special design of star spokes and the cranks are bayonet shaped. The lugs on the bracket, which is a drop forging, are bored out on the inside to reduce weight and milled off on the outside to receive the frame tubes flush joint fashion. Other bicycle forgings made by the company and furnished either in the rough or accurately machined are fork crowns, seat clusters for both diamond and drop frames, and one-piece steering heads. Two patterns of fork crowns are made, one being of special narrow and light design for use in racing machines. The company states that users of its one-piece hanger will be fully protected.

#### RAMSEY PEDAL PATENT ALLOWED.

Patent was allowed December 27 to Robert H. Ramsey, president of the Ramsey Swinging Pedal Co. of Philadelphia, on his well known swinging pedal invention, application for which was filed December 22, 1897. All the claims and specifications of the patent as issued are embodied in the following extract: The invention consists in the combination in a bicycle pedal of a fixed or reversible anti-friction casing provided with depending ears and roughened tread-bolts, foot-rests or plates which are screwed or otherwise removably attached to the anti-friction ball casing so as to be easily detached. A horizontal line drawn from the top of one bolt to the top of the other

THE CYCLE AGE

passes below the center of revolution of the ball casing, which can be made reversible so that the bearings may be changed and the life of the cones and balls increased. The studs or screws that secure the pedals to the crank arms are made separate from the other parts of the pedals and can be made to fit a great variety of threads of different sizes in the crank arms of the various makes of bicycles now in use.

#### STEARNS' ANTI-VIBRATION MODELS.

From the earliest period of bicycle making inventors have studied to make riding easy and comfortable. All manner of spring and

## DID YOU EVER NOTICE

how a snowball grows in size as it rolls along? It's all simple enough—nothing but holding fast at each revolution to what the last revolution attached.

Precisely so in business—old customers must stick if the business ball is to grow. What makes them stick? A good many things, but the foundation is always the same—sound, reliable goods—goods that keep your promises—goods that work and wear.

League Tires are **business-holders**—light, lively, lasting. From tube to tread everything is first class—not an ounce of dull, heavy rubber, not an inch of cheap, short fibre fabric. Every "Get there and get back" tire is a running advertisement for some one—why not for you? Call or write.

elastic contrivances have been used with variable success, but most of them have developed such serious objections that they have finally been abandoned. In the hygienic cushioned Models K and L of the Stearns '99 line, herewith shown, the desired result has been accomplished. No change is made in the general lines of the frame. The cushion action being entirely concealed within the tubing over the rear wheel, there are no

points of marked difference that would attract the attention of the observer. The weight is increased but little. There is no loss of power in propulsion because there is no deviation in the distance between the saddle and pedals, nor between the sprockets. Notwithstanding the fact that the cushion device is placed in the rear frame only, it relieves the rider from shock to both wheels. In hill climbing the rear wheel adjusts itself so quickly to all obstacles in its path that hill climbing is, if anything, less of a task than with a rigid frame. The hygienic cushion frame is free from sudden vibratory motion and the sensation of riding it is as easy as the cushion effect of a large pneumatic tire blown soft. It has no bounding or swinging motion which would be disagreeable and dangerous, but gives a peculiarly deliberate play and graduated action. It has special points to commend it to women as the jarring experienced in passing over rough places is at once dissipated by the gentle, yielding action of the cushion frame.

#### SELLING AGENTS FOR ELECTRO GAS LAMP.

The Electro acetylene bicycle lamp, made by the Electro Lamp Co. of New York, is now controlled by three distributing agents from whom dealers and jobbers can obtain territory. Greene & Haskell, 3 Union Square, New York, look after the states of New York, Massachusetts, New Jersey, Rhode Island, Ohio, Indiana, Maryland, Pennsylvania, Maine, New Hampshire, Vermont, Virginia, West Virginia, North Carolina, South Carolina, Kentucky, Tennessee, Georgia, Florida, Alabama, Mississippi and Louisiana. W. J. Buckley & Co., 204 Dearborn street, Chicago, control Illinois, Michigan, Wisconsin, Minnesota, North and South Dakota, Indian Territory, Missouri, Kansas, Nebraska, Texas, Arkansas and Iowa, while the states of Colorado, California, Idaho, Oregon, Montana, Wyoming, Utah, Nevada, Arizona, New Mexico and Washington are supplied by N. Pendleton Rogers, 106 Wall street, New York. One important item for the jobber's consideration is the fact that the Electro Lamp Co. has two large factories which are to be devoted entirely to the manufacture of this lamp. Lamps are now in stock, ready for immediate shipment, and about 3,000 are being completed each week. The aim of the manufacturer is to produce a lamp which does not need the care of a mechanic to keep it in proper burning order and which can be turned out in thousand lots as successfully as when but a few are carefully made by hand. The Electro is one of the smallest and lightest acetylene cycle lamps made, it weighing less than a pound.

#### PRATT BROTHERS FORM NEW COMPANY.

Pratt Bros. & Co. is the name of a new firm which succeeds the late Manufacturers' Agents & Supply Co. of Chicago in its business of jobbing bicycle materials for factory trade alone. The present headquarters of the company are at 115 Lake street, Chicago, and 127 Duane street, New York, the eastern and foreign trade being handled from the latter office. The general trade and business of the Manufacturers' Agents & Supply Co. having been sold to the Excelsior Supply Co., Pratt Bros. & Co. will cater only to the large jobbing and factory trade, and will control the following lines: Ferrite Steel Cycle Fittings Co.'s ferrite metal castings for bicycle and special work;

Lanz Owen & Co.'s "E. Z." and "Cork Face" saddles and full line of tool bags; Snell Cycle Fittings Co.'s pedals, hubs, drop forgings and handle bars; J. C. Spiers & Co.'s cycle wrenches; Elastic Tip Co.'s cements and rubber specialties, and Scoville Mfg. Co.'s oil cans, pumps, bells and special work in brass done on contract.

#### HANGER AND MORROW HUBS IN SETS.

The Eclipse Bicycle Co. of Elmira, N. Y., has decided to place a complete hanger in the market, to be sold in combination with a pair of Morrow hubs, so that small builders throughout the country can build machines fitted with the Morrow automatic coaster and brake.

#### THE YALE CYCLES.

The leading models of the line of Yale bicycles built by the Kirk Mfg. Co. of Toledo, are men's and women's special roadsters selling at \$50. They are cleverly designed little machines with attractive frame lines, flush joints, eccentric chain adjustment at hanger and other popular features of the time. The frames are made in several heights and are enameled in black, Yale blue, green, tan or maroon. V section maple rims striped in colors to harmonize with the frame enamel are used in the wheels, whose further makeup includes Excelsior spokes, specially designed hubs with positive adjustment, and Morgan & Wright, Hartford, Dunlop or Defender tires. Model 33 is the smallest size made in the men's special road pattern, it having a 20-inch frame. If desired it is equipped with guards over the rear wheel, thus converting it into a fine de siecle mount for the lady cyclist who

Model 34—Men's Special roadster. Price, \$50.

Model 32—Ladies' Special roadster. Price, \$50.

desires the rigidity and lightness of the diamond frame. The special roadster sells at \$60 and is altered in frame construction in such points and ways as to best suit the incorporation of 30-inch wheels. It is built with 23 or 25-inch seat mast and on account of the eccentric chain adjustment the hanger drop may be  $3\frac{1}{4}$ , 4 or  $4\frac{1}{2}$

Model 33—Ladies' diamond frame roadster. Price, \$50.

Model 37—30-inch wheels. Price, \$60.

inches. Other specifications and the general design are the same as in the 23-inch wheel patterns of the Yale Special. Two models, a man's and a woman's, each built in frame heights to suit and bearing the name of Yale roadster, are listed to sell at \$35. They have all the up-to-date features and the stylish appearance necessary to gain favor among the trade and are honestly and conservatively

built with view to supplying dealers with machines which can be sold at a popular price and which will be entirely off the dealers' hands when once delivered. They are not intended to increase the profits of the repairmen. Large sprockets, 3-16-inch Indianapolis chain, Avery two-piece hanger, Brown pattern saddle, Morgan & Wright double tube, Hartford No. 70, Defender or

Model 28—Men's roadster. Price, \$35.

Model 26—Ladies' roadster. Price, \$35.

Indiana tires, and any shape of fixed steel or ordinary adjustable handle bars are among the many attractive fittings offered. The enameling is in the same colors as those offered on the \$50 models and is finished either plain or with striping. The Kirk Mfg. Co. is bidding for direct business with capable agents and is not selling to jobbers.

#### END CUTTING JIG MADE IN MILWAUKEE.

The jig for cutting tube ends at an angle to fit snugly around the head tube of a bicycle, as described in last week's issue of Cycle Age, was designed by the C. J. Smith & Sons Co. of Milwaukee, who make it for customers at a low price, so that they may use the Smith flush head without inconvenience.

The Monarch Cycle Mfg. Co. of Chicago will exhibit its models of Monarch bicycles in spaces 39 and 46 at the Chicago cycle show, which opens Saturday.

The Adams & Westlake Company of Chicago is preparing to open a New England branch in Boston under the management of C. A. Underwood.

#### Competition That Pays.

There is but one form of competition which is really remunerative, and that is the competition of novelty and variety in goods. In contradistinction to the rivalry which produces a reduction in prices, the former is both laudable and legitimate. It may be freely indulged in by all merchants with a view of raising the standard of the store to the most exalted position attainable. In this way the most popular and salable goods only are kept in stock, and displayed in the most attractive manner possible. Such competition makes money for those who are able to succeed in it, for it is the kind which calls forth all the latent ability of the merchant in originating, executing and developing the best methods by means of which business may be made to thrive and prosper. It certainly requires more study and mental effort of every kind to succeed in this way than the other more common and objectionable one of underselling. Any one, even a child, could mark down figures and advertise cut prices with a great flourish in the newspapers; whereas it requires real talent to compete in the quality, workmanship and design which goods may possess. It necessitates personal trips to the market, a receptivity of mind in adopting the new ideas which are gleaned from observing the methods of others and a constant desire to improve upon the past. In short, keep the different lines of goods vying with each other in wholesome rivalry for the most praise and popularity.—Stoves and Hardware Reporter.

MR. DEALER:

Doctors advise cyclists not to contract the chest—not to prevent free respiration. Therefore it is advisable to handle the Claus Bar, because it is the only bar that retains its width at all adjustments. Our prices will interest you.

# THE PASTIME AND SPORT

## GIBSON EASY FOR ELKES

Given a Long Handicap the Ohio Boy Loses His Match by Four Laps Other Races.

New York City, Jan. 2.—The ten-mile paced match race between Harry Elkes and Harry Gibson, the Ohio ex-amateur styled Michael No. 2, which was the principal event at the New Year's eve meet at Madison Square Garden, was monotonous and almost farcical in the ease with which the world's hour champion ran away from his competitor. Gibson was given a handicap of forty-five seconds, equivalent to three and a quarter laps, but despite this Elkes finished more than four and a half laps in the lead. Gibson's pace was inferior to that of Elkes, but owing to the breaking of a chain the New Yorker had to ride a full lap un-paced. Elkes' time for the ten miles was 20:30 1-5, an average speed of 2:03 to the mile.

The first heat of the pursuit race between tandem teams of brothers was won by the Butler brothers, who passed the Turville brothers at seven and three-quarters laps, or about three-quarters of a mile from the start, in 1:32 1-5. In the second heat the Kraemer brothers of Chicago, who have come into prominence the past year, defeated the Lawson brothers, also of Chicago, in ten and three-quarters laps, the time being 2:15 1-5. This brought the Butler and Kraemer brothers together in the final, in which the Boston team gained rapidly on the Chicagoans after the first two laps and overhauled them after going six and three-quarters laps in 1:22 4-5, the laps being ten to the mile.

Brown and Adamitz won the two-mile amateur tandem pursuit race by overtaking Schreiber and Wahrenburger just as the two miles were finished, the time being 4:14 4-5. The defeated team rode the last half with a flat tire.

The one-mile professional handicap was a hot fight between Newhouse, Terrill and Leonert, who finished in the order named about a yard apart. Time, 2:15.

Joe Downey, the Boston boy wonder, rode a mile exhibition paced by a tandem in 2:05 4-5, doing the first half in :59 2-5, lowering the indoor record by two-fifths of a second.

## Spalding on Racing Control.

Concerning the mooted question of the relinquishment of League control of racing, A. G. Spalding, whose long experience in such matters through his interest in the national sport of baseball entitles his opinion to unusual consideration, is quoted as follows:

The L. A. W. is the natural body to control racing, and, in fact, it is the only national body organized today that is competent to handle it. While in the past they may have made some mistakes in meting out proper punishment, yet I am satisfied that the majority of people in this country who take an interest in cycle racing believe in the honesty of purpose that prompts the action of the officials of the L. A. W., and without such confidence of the public no sport, especially professional, can be successfully carried on very long. I think it might be possible to organize an association for the exclusive control of professional cycle racing, but to be successful it must be national in character and controlled by representative men in the leading cities in the country. Not only would it require representative men in whom the public has confidence, but it would also, probably, take considerable capital to properly carry it on. Until such a representative association is organized, I am strongly of the opinion that the L. A. W. is much better equipped to handle the racing of this country, both

amateur and professional, than any other organization. While to some it may seem incongruous for an amateur organization like the L. A. W. to take under its direction and fostering care professional racing, yet in order to keep this sport clear from corruption and misdirection, and as the tendency of all sport where great skill is required is toward professionalism, I think it would be a mistake for the L. A. W., a mistake for the racing interest, and a mistake for the racing men, to give up its control of professional or amateur racing.

## MAY BE A LOVE FEAST

Opposition to Keenan Disappears and Leaves a Clear Sky—The League Will Benefit.

Philadelphia, Jan. 2.—The opposition to T. J. Keenan, Jr., for the presidency of the L. A. W. has so nearly disappeared that it is not improbable that his name will be the only one mentioned in that connection at the meeting of the National Assembly next month. The report that the majority of Pennsylvanians were in favor of Buffalo for the next League meet undoubtedly had its effect in whipping the New Yorkers into line; and President Potter's refusal to run again probably helped a little—at any rate the Empire state will offer little or no opposition to the gratification of the Pittsburgher's aspirations. Sams will be content to wait till next year, so that at the present time everything appears favorable for a veritable love-feast at Providence next month.

This is a happy state of affairs for if ever the League stood in need of a pull-together policy it is now. The heartburnings that have followed every gathering of the National Assembly for the past half-dozen years and a convention marked by an utter absence of the usual bickerings and political methods will do much to bring about a restoration of the former good feeling and enable the League to present a formidable front to the foes that beset it.

## Pitman for Racing Board Chairman.

Will R.—more often yclept "Happy Days"—Pitman, one of the founders of the L. A. W. and winner of the first bicycle race in America, is being boomed by his friends as a candidate for the chairmanship of the racing board of the League in opposition to "Uncle Jerry" Mott, the present much criticised incumbent of that office, and C. W. Means, of Cleveland, an aspirant for the honor of wearing George Gideon's big shoes, which he believes he can comfortably fill now since his success as an original Keenan man. Pitman favors the retention of racing control by the League—of course—and if appointed says he will reorganize the racing department of that body and meet the racing men half way, although he does not favor the admission of the pros to membership. He has the backing of Potter, Gideon and Chief Consul Belding of the New York division.

## Algerians Interested in Races.

The first meet of the European winter circuit held on African soil was run at Oran, Algeria, December 19, and drew an immense attendance. Banker won the 1,000-meter handicap from scratch in 1:24, with Tommaselli, 15 meters, second, and Grogna, 25 meters, third. These three also won their heats in the grand prize of Oran, the final of which was to be run Christmas.

M. Baliff, founder and president of the Touring Club of France, has had conferred upon him the decoration of the Legion of Honor.

## AUSTRAL WHEEL MEET OPENED

First Day's Races Run on Melbourne Grass Track —Bookmakers Prominent—The Races.

Sydney, Dec. 3.—The Austral Wheel race meet was opened on Saturday, November 26, on the Melbourne grass track, in the presence of 15,000 spectators. The second day's races will be run this afternoon and the meet will conclude with the events of next Saturday. The bookmakers attended the opening day in large numbers. All the leading Melbourne bookmakers have opened books on the Austral race, and if any man was lucky enough to be able to pick the winner he could win \$250,000. The Melbourne Bicycle Club has also opened a consolation sweepstake on the event, with \$1,000 as first prize.

The first event was a 1½-mile handicap for the Melbourne B. C. plate and \$250 first prize. The race was run off in thirteen heats and a final. A. A. Middleton, who won the Austral in 1894, captured the first prize in this event, from 40 yards, in 3:25 1-5. The veteran led entering the last lap and won by a wheel length from A. E. Tame, 75 yards, who went after him. A. J. Berry took third from 100 yards.

The one-mile scratch race was run off in five heats and a final. R. Mutton created a big sensation when he beat B. Walne in his heat, though an excuse was found for the champion in the fact that he had had a bad spill the day before while training. Jack Pearson lost his heat to A. C. Forbes. The final went to W. C. Jackson in a hard fought finish won by a wheel length in 3:17 4-5. L. Barker took second, and D. Walker third.

The 25-mile scratch race for \$250 first prize had thirty-nine starters who were sent off with a flying start. In the fourth and twelfth miles there were spills, in the second of which Middleton dislocated a shoulder blade. Entering the last lap Forbes led and Jack Parsons went after him, and half a lap from the tape passed him momentarily; but Forbes regained the lead and rode in an easy winner, with six lengths to spare. J. Carpenter finished second, and L. M. Jackson third, while Parsons came in fifth. Time was 1:06:13 4-5.

## Chicago Club's Scorch to Pullman.

The tenth annual 2:50 club scorch to Pullman of the Chicago Cycling Club was won last Sunday by Fred Nelson, brother of O. B. Nelson, who won the Decoration Day road race in 1896. His time from the start at Thirty-fifth street to the finish, about fourteen miles, was 45:00, which is fourteen minutes slower than A. J. Nicolet's time last year. The rough and icy condition of the course and the 10-above-zero weather accounted for the great difference in the times. About thirty riders started. There were several falls but no injuries and only one punctured tire. There were no official timers, but the leaders finished about one minute apart in the following order: Fred Nelson, O. B. Nelson, W. B. Ferguson, John Nelson, Orlando Adams, James Levy, N. B. Van Sicklen, A. T. Helwood, C. G. Sinsabaugh and C. P. Root. E. Lingenfelder reached Pullman first, but was disqualified for cutting the course.

## Illinois Would Admit Professionals.

At a meeting of the Illinois division L. A. W. held at Springfield last Thursday the delegates voted to work for the admission of professionals to membership in the League and instructed the delegates to the National Assembly to cast

# "Orient Cycles Lead the Leaders"

THE LARGEST RETAIL BICYCLE  
DEAL EVER MADE ❁ ❁ ❁ ❁ ❁ ❁

A letter from the largest legitimate retail bicycle dealer in the world telling why he wanted the ORIENT, the recognized leader of the High Grade Bicycles of the world.=====

New York, December 31st, 1898.

WALTHAM MANUFACTURING COMPANY,  
Waltham, Mass.

Dear Sirs:

We thank you for your favor of the 28th inst. and for your enclosure of an article concerning our relations to the retailing of Humber Bicycles, clipped from a trade paper of October last. This is the first information that has reached us that articles so lacking in accuracy and sound reasoning in the matter of our bicycle business are in circulation, and we must also plead ignorance as to the injury that their injustice may have done.

We think we could well afford to allow the whole matter to rest upon its merits as already presented, and that it will probably be a waste of time to draw the question from present oblivion that we may dignify it by reply.

Evidently you do not share this opinion and in deference to your views we add the following to what we have already made public:

Every intelligent person at all familiar with our affairs knows perfectly well that the term "department store," as contemptuously used toward our business by various writers on Cycle subjects, is a misnomer without foundation in fact or reason in application. Our business is conducted upon the soundest mercantile principles that we can understand, and catch-penny methods of any sort whatever find no welcome here. If there is one man in the United States that, more than any other, knows in his inmost mind and heart the truth of that assertion, it is the late resident director of the Humber Co. in America. Through him we made a contract in the Autumn of 1897 for twenty-five hundred bicycles. The Roadster, the most important model in that contract, was to be sold at \$100—other models to be slightly higher.

The early demand for Bicycles was disappointing, and an agreement was reached in March for the reduction of the Roadsters to \$75.00, and other models in proportion. The Humber director was more anxious than we for this reduction. Rebate checks were sent by us for the amount of the reduction to all previous buyers, and an allowance of \$5 a wheel was made by the Humber Co. on the entire contract. This sealed the fate of expected profits on our Humber bicycle business, as the margins were reduced below the cost of distribution.

Having implicit faith in the Humber Co., and being assured of their support we guaranteed the price of the Humber wheels to all buyers, to the date of the expiration of our contract and fully expected, because of certain additional assurances, to maintain them until now.

We accepted and paid for all the wheels called for by our contract, and fulfilled our obligations in letter and spirit. In spite of a slow market we held our way firmly in consequence of a verbal promise from the Humber Company that none of their wheels would be manufactured in excess of orders. Three responsible witnesses can attest to the truth of this statement.

Within a few days of the first of September we were astounded by the statement on behalf of the Humber

Company that they had accumulated a stock of eight hundred and sixty bicycles which they demanded we should buy for our own protection. The promise not to manufacture wheels in excess of orders was the rock upon which we based our firmness as to retail prices. We vainly urged the demands of good faith that required the Humber Company at least to carry their stock until next Spring, and were met with the threat that, if we did not buy them they would be offered elsewhere.

We refused, as would any self-respecting merchants, to be coerced. The Humber Company had our good money. We had a large quantity of their wheels. Then followed the suicidal action of the Humber Company. The wheels were sold and on Saturday, September 10th, we knew that Roadsters were to be advertised at \$50. Our reputation was at stake, and we reduced the price to \$40. We were unwilling to be publicly compromised by another's loose views of square dealing. Various transactions in Humber wheels of which we were ignorant followed, and the wretched scramble about prices was the result. We never owned a Humber bicycle except such as we bought directly from the Humber Co.

The responsibility rests solely on the Humber Co. for our heavy losses and their depreciated trade mark.

If these statements be true, and they cannot be denied, are not the condemnations of trade journals of our course in the Humber Bicycle business utterly unfounded? The much exploited recklessness of methods falls back with crushing force upon the Company that lacked the wisdom, to say nothing of the higher obligations, to conduct its business with reason and common sense.

That we should be regarded as so lacking in ordinary judgment as to wilfully and recklessly throw away tens of thousands of dollars in a competition of destruction is not complimentary to our pride—our consolation is in the dullness of the writers that could imagine such a possibility. On the other hand money considerations weigh little with us when our reputation is at stake.

After such a disappointing experience we naturally felt very cautious about making another deal for high grade bicycles, and from our former experience saw that it would be necessary not only to get a bicycle which was as good as the best, but one that was made by a reputable company who kept abreast of the times, and who sold goods at an honest price, and had one price for all.

After thorough investigation we believe that we have found such a wheel in the Orient and such a company in the Waltham Manufacturing Company. Therefore our policy for '99 will be to advertise the Orient bicycle as our leader, and to guarantee the price during the season of '99. We guaranteed the price of the Humber and upheld it until we were compelled to cut by the Humber Co. We shall guarantee the price of the Orient, and do not believe that we shall be compelled to cut the price on it by the Waltham Manufacturing Company.

Very truly yours,

(Signed) JOHN WANAMAKER.

MR. DEALER:—Is it not to your interest to handle a bicycle that is "as good as the best" and one that is made by a progressive company who keep abreast of the times, and who protect their agents and hold up the price and reputation of their goods at all hazards? If so, write to=====

WALTHAM MFG. COMPANY, 315 Crescent Park, WALTHAM, MASS.

their votes and influence to that end at Providence. The action means that the west will make a strong fight for the pros and will join forces with the eastern divisions that are interested in the movement.

### QUESTIONS THAT PERLEX

#### Movements of the Midget—Is Riding Horses in New Orleans Now—Marriage Affirmed.

Michael's double game of cyclist and jockey is a hard one to understand, except on the supposition that he is fortifying himself against the time when his phenomenal ability as a bicycle rider wanes in order that he may still enjoy the distinction of being rated as the best of his class by the world, or upon the other less complimentary supposition that while his inclinations pull him toward the turf his friends and those who admire him as a cyclist influence him in the other direction so strongly that he vacillates between them. Promptly upon the heels of the report that he had secured Al Weinig as a trainer and would enter into competition on the cycle track again this year comes a telegram from New Orleans this week stating that the pair arrived in the Crescent City on Monday, where Michael was given a jockey's badge by Secretary Clark, having already had a license from the Turf Congress to ride. The Midget reiterates his intention to become a jockey, it is said, and will put in his mornings at the track schooling himself to break from the gate.

Apparently the question of his marriage is now definitely settled in the affirmative by the following statement from a firm of lawyers, Aberman, Wales, issued subsequent to a report in the London papers upon Michael's arrival in England last fall that the Welshman was not married: "As the solicitors representing the estate of the father of the young woman who is Michael's wife, we cannot allow the statements to go uncontradicted any longer. We have before us the certificate of marriage dated March 13, 1896, which proves that Michael is a married man."

### NEWS IN BRIEF.

The Paris-Roubaix road race will be run April 2.

The membership of the Illinois division has fallen off more than two-fifths in the last year.

The Grand Prix de Paris will be run on the municipal track of Vincennes on June 18 and 25.

Willy Arend, the world's mile champion of '97, has retired from the track in Germany and gone into business.

Jack Robertson, the Englishman who raced in America last spring, has retired from the path to take up the practice of law.

Orlando Stevens is visiting his team mate, Floyd McFarland, in San Jose, Cal., where he will await the opening of the circuit in the spring.

Frank Kramer, the amateur champion of the L. A. W., has become an "outlaw" through competition at the Madison Square Garden unsanctioned races.

The Paris-Bordeaux motorcycle race will be run May 24. A German sportsman has offered a prize of \$2,000 to anyone making the trip without stopping at intermediate towns.

E. C. Smith, one of the contestants in the December six-day race, has brought suit against the management of Madison Square Garden for ruling him out of the race for alleged disability.

A new motorcycle hour record of 30 miles 2,136 yards was established December 15 by Rigal in France, who three days previously placed the kilometer standing start motorcycle record at 1:17 4-5.

Henri Fournier is anxious to take on another match race similar to that in which his motor bicycle broke down December 26. Had

the driving belt not broken, he says he would have tired out the human pacemakers.

Arrangements have been completed by Jack Prince for a southern indoor circuit during February embracing Atlanta, Savannah and Jacksonville. The meets will be conducted by the National Cycle Racing Association.

From a Mansfield, O., source it is learned that Arthur Gardiner may retire from racing at the request of his father, who is now in Europe recuperating his health, while Arthur fills his position here, which is an important one.

During 1898 the German bicycle tracks gave 236 race meets, at which 1,208 races were run and 1,093 riders competed. Cash prizes to the value of \$58,018.75 were given and 2,672 medals, cups and other objects of art were put up for amateurs.

Nat McDougall of Milwaukee, who holds the quarter-mile, one-mile and five-mile Wisconsin championships and who defeated Earl Peabody at Green Bay and Oshkosh last year, may compete at the international bicycle races to be held at the Paris exposition in 1900.

Harry Elkes, through his manager, has offered to meet Chase, Linton, Huret or Cordang for a purse of not less than \$2,500, stipulating that the race shall take place about Easter and that motor pacing shall be barred since he is not familiar with that sort of assistance. If so large a purse cannot be raised, he is willing to meet any one of the foreigners in this country for a smaller prize.

At the races advertised to be run last night at Madison Square Garden by the National Cycle Racing Association, C. W. Miller and Frank Waller were matched to ride a five-mile paced contest and Joe Downey was to be pitted against Harry Elkes, in mile heats, paced and unpaced, the Boston schoolboy turning professional in the event. Twenty men were entered for the 24-hour race, the list including most of the contestants in the recent six-day contest.

Seven hardy road riders ran a five-mile cross country chase in New York city on New Year's day dressed in sleeveless jerseys and linen trousers reaching only to the knee. Only two of the seven wore stockings, although the temperature was at 14 degrees above zero and a stiff cold wind was drifting snow and small bits of ice. As a consequence the riders suffered intensely and made a New Year's resolution not to repeat their folly. Out of consideration for those who took part their names are suppressed in the hope that it may help them stick to the resolution.

George Banker says he believes that it is but a question of a short time until the new racing association of America will gain recognition, at least in France. He says in a letter to a friend in Pittsburg that at the outset of the trouble of the racing men with the L. A. W. he believed the breakaway a mistake and certain to fail. The unity of purpose among the riders, however, did much to strengthen his opinion of their power, and the recent converting of so many additional amateurs and professionals at the Madison Square Garden races quite sweeps the field and wins the day.

Regarding the present condition of racing affairs in the United States a prominent French racing man writes that the cracks in France are following the fight between the professionals and the L. A. W. with much interest and sympathy. He thinks the matter will resolve itself into a condition in which the professionals will all unite and form an international union of their own and the amateurs will organize a separate association, while the non-racing men will be left in the League or will form a touring club. It may be some time before these changes are effected, as the riders of all countries must work together to that end.

### Crane is a Great Rhymester.

Charles S. Crane, the general passenger agent of the Wabash, is quite a poet, and has written many nice things. Recently he read the poem on the "Music of the Wheels," written by E. E. Coyle, for the Baltimore Morning Herald, which runs as follows:

#### MUSIC OF THE WHEELS.

When you're riding on the railroad  
At a mile-a-minute crack,  
Did you ever note the rhythm  
Of the wheels along the track?  
Is there any great composer  
Of sharps and flats and bars  
Can equal in his cadences  
The music of the cars?

Whether dashing through the meadow,  
Or the tunnel's choking grime,  
You will never hear them falter  
From the measured beat of time;  
Charging wildly 'mongst the mountains,

Or by the river's bank,  
You will always find them playing—  
Click-clickety-click-clank.

Every air that has been written  
Since the days of wicked Cain  
Finds a fit and perfect setting  
In the rhythm of the train;  
From opera to comic song,  
From Patti down to Cline,  
You can hum all sorts of ditties  
While rushing down the line.

After reading the above Mr. Crane got his typewriter in order, and by screwing up the poetical lever ground off the following:

It's too bad to spoil the story  
Told in cadence sentimental,  
But it's not so on the Wabash  
With its famous "Continental."

If you are about to travel  
Please note the following points,  
The Wabash track is perfect,  
And you cannot count the joints.

In its wheels there is no music,  
At a mile-a-minute gait;  
And of course there is no rhythm  
On a track that's up-to-date.

There is no measured beat of time;  
In fact it can't be measured.  
We beat our rivals every time,  
A fact that should be treasured.

## AND TRADE REVIEW

VOL. XXII—No. 11.

CHICAGO, JANUARY 12, 1899.

NEW SERIES No. 60.

### TO CONTROL RUBBER SUPPLY TIRE MAKERS NOT AFFECTED

**Difficult Task Which Rubber Manufacturers Have Set Themselves—Reduction in Prices Imminent.**

Though no tire makers will confess to knowledge of the intentions or operations of the recently reported combination among rubber firms, yet it is said to be part of the plan of the combination to control crude rubber prices. The India Rubber World claims to be in possession of information, deemed trustworthy, to the effect that the new organization is meant to include all branches of the trade other than rubber boots and shoes and hard rubber goods. The footwear trade is largely in the hands of the United States Rubber Co., and three of the four American manufacturers of hard rubber formed a consolidation only a few months ago.

No list has yet been given out of the manufacturers who have signed the agreements drawn up by the promoters, but it is stated that the signatures have been obtained of concerns doing a business of \$10,000,000 per year, out of an estimated total annual business, by the companies considered eligible, of \$25,000,000.

#### To Cut Prices 7½ Per Cent.

A cut of 7½ per cent. in prices is promised as soon as the combination takes effect. As for the lines on which it is proposed to conduct the industry, it is suggested that benefits would accrue from so differentiating the work of manufacture as to confine each branch to certain factories, instead of each attempting to produce a variety of goods. Again, with factories in different states, a division of trade could be made on a territorial basis, whereas now every important concern is trying to sell goods in every part of the country. Not the least of the advantages claimed under the new arrangement is that crude rubber may be purchased more economically by the manufacturers working together than is now the case.

#### How Crude Stock Can be Controlled.

While individual concerns, with small capital, could effect little in the way of influencing crude rubber prices, it is claimed that the total production of rubber is so small, and is confined to such narrow geographical limits, that the investment of say \$8,000,000 of capital would make possible its complete control. This would involve co-operation in European markets, of course, since prices of such a commodity cannot be fixed in a single country; but it is held that this will not be an insurmountable difficulty in these days when cabled market reports enable the whole situation to be known in any important center.

In answer to suggestions regarding the ability of small manufacturers who may be left outside this combination becoming strong enough in time to prove formidable competitors, it is claimed that they will be permanently at a disadvantage (1) from the lack of the peculiar economies of production and the superior channels of distribution possessed by the big company, and (2) from their inability to buy rubber on so favorable terms. The proposed control of the crude rubber market is expected to afford a marked relief from the present conditions of high priced material.

If any hope is entertained of keeping the Para rubber production under control on account of the scarcity of labor along the Amazon, it may be suggested that new operators in the field would have open to them the entire coolie labor market of the East Indies. Already in Trinidad, Jamaica, British Guiana, East Africa and Australia coolies, "indentured" for a term of years, are employed on a large scale. People of the same type have been the making of Java, where they have shown their fitness for rubber gathering, and there is every reason to believe that they could be introduced with success into South America.

#### Harry Rouse Resumes Cycle Building.

The machinery of the old Rouse, Hazard & Co. plant in Peoria, Ill., has been sold by the Peoria National bank and Joseph Miller & Sons, to Harry Rouse, who took one half of it and to the Peoria Rubber & Mfg. Co., which took the other half. Harry Rouse, of the old firm of Rouse, Hazard & Co. took possession of the plant last Monday, and will immediately work into complete bicycles the material now in the factory. As soon as this is finished he will remove his machinery down town and engage in a general bicycle business, and the Rubber company will take possession of the Rouse factory and put in the plant for the manufacture of Dur-year motor vehicles.

#### Overproduction in Austria.

A cablegram from Vienna announces rather vaguely that a crisis has begun in the bicycle trade there owing to overproduction.

### CO-OPERATIVE BICYCLE PLANT UNION LABEL TO BE PROMINENT

**International Union of Bicycle Workers Develops a Plan for Making Cheap Machines.**

Out of Toledo comes the report that the International Union of Bicycle Workers intends to enlist capital for the operation of a bicycle factory conducted on the co-operative plan, the product of which will be branded with the union label and will be sold direct to riders—principally those who are in sympathy with labor movements. The story receives confirmation from President Mulholland of the International Union, who asserts that there is an abundance of capital at his command the moment he gives the signal for launching the enterprise.

#### Pronounce the Scheme a Bluff.

By those in Chicago whom the news has reached it is believed that the International Union is far more desirous of implying competition to those who oppose the adoption of the union label than of actually engaging in such competition. In any event, the dangers attending such an enterprise would be so great in the present crowded state of the industry that unusual courage would be required of financiers asked to risk capital in the undertaking. Speaking of the project, Mulholland says:

#### Plan a Long Time Hatching.

"For some time we have felt that we should start a co-operative bicycle plant, for the benefit of our men, as well as for the people in general who ride wheels. To understand the situation, you must remember that some wheels are so poorly constructed that they will scarcely support their own weight, and they are sold for prices at which you could not expect the raw material to be bought.

#### Criticizing Cheap Machines.

"The people want cheap wheels, and they purchase where they can get them cheapest, never stopping to think of how they are made. There are, of course, some good cheap wheels on the market, but how is the public to know if they are put up by skilled mechanics? The only guarantee the public could have would be to demand a wheel with the union label.

"We believe that by starting a factory on the co-operative plan, putting nothing but first-class material into the wheels and selling direct to the purchasers, the enterprise would net big returns. In this country there are three million organized laborers whose patronage would be given to such a plant."

Organized labor will buy its bicycles as it buys its merchandise—where it can get the best value for the money.

## BRAZING BY IMMERSION

### Elementary Facts and Ideas Pertaining to the Modern Brazing Method—Economy in Fuel

With watch in hand the time consumed in brazing the two head connections of a bicycle frame by the dip-brazing method was found to measure 38 seconds, with variations of less than 5 seconds in two trials. The crank hanger joints required 48 seconds. The time for changing from one joint to another was about 30 seconds; occasionally more. The seat mast cluster and the rear fork ends required about the same time as the head connections. Total for the "four corners" of a bicycle frame, including four changes of

are not yet fully understood and mastered by anybody. Ultimately several distinct styles may prevail, each for its own class of work.

At one point the saving by dip-brazing in comparison with flame brazing is so

Dipping the Bottom Bracket—Front View of Fulton Furnace.

one-half minute each, 4 minutes 42 seconds.

#### The Process in Operation.

The occasion was a visit to the Fulton Machine Works, of Chicago.

With a working day of 8½ hours, allowing 1½ hours for starting the furnaces and getting ready, this makes 110 frames for a 10-hour working day with one furnace.

By starting the furnace before the brazier arrives and by convenient arrangement of the frames to be brazed, similar or better results may be obtained with a shorter working day; and with shifts of braziers and continual work—as in the busy season—the efficiency may be still further increased, time being taken for replenishing the crucible with spelter as often as required.

The accompanying pictures show an "old style" furnace. The styles change rapidly in new forms of work. Small alterations in the form of crucibles, the direction of draft, the dimensions of the opening between the crucible and the fire brick, etc., mean savings of waste in a hundred and one ways, all of which

pronounced, however, that no retrogression seems possible. This saving comes

Sample Work, Showing How Deeply Tubes are Immersed.

in by the opportunity which heating of spelter in a furnace offers for using hard coal instead of gas and utilizing the

heat economically instead of wasting nearly all of it on empty space. One dollar's worth of hard coal suffices for keeping spelter that is selected in a crucible up to its proper temperature for a working day, while seven or eight dollars' worth of gas must be blown in to the air by the flame-brazing method to heat joints and fuse spelter for a similar amount of work. The difference is due not only to the nature of the fuel used, but much more to the sinful waste of fuel which takes place when joints are required to absorb heat from a rapidly moving current of burning gas mixture,, of which no part remains in contact with the work for more than a small fraction of a second.

#### Temperature of the Spelter.

In dip-brazing furnaces the heat is regulated by the forced draft at will. One illustration, which gives a front view of the Fulton furnace, shows a draft pipe entering on the opposite side and provided with a check within easy reach of the operator. It has been found unnecessary to make frequent changes in the draft, however, and in the new style the regulating is done from the rear of the furnace, which is shown in the second illustration. Stoking and feeding of the fire is also done from the rear, so that the operator when working is not exposed to the heat from the furnace doors. The small box shown at the right hand side of this view contains hard coal; it holds about one and a half bushels, and two such box-fulls are ordinarily sufficient for a day's work.

#### Burning of Steel Impossible.

It is found by practice how strong the draft must be to keep the spelter in the proper condition. When work is not being done, as in the dinner hour, it may be almost entirely shut off, but at other times when heat is being absorbed by the bicycle tubing and lugs, the draft is adjusted to produce a steady accession of heat to balance against that which is taken away in the work. No difficulty is experienced in obtaining uniform results in this respect.

When the spelter has reached the most favorable temperature small bubbles are observed along the edge of the crucible. These bubbles indicate occluded gases which are being expelled from the molten mass. When the heat becomes too great the fact is readily noticed by blue fumes, which indicate that the zinc in the spelter is being burned. If the operator should fail to notice the blue fumes—which is hardly conceivable—another safeguard against too high temperature prevents all possibility of doing bad brazing; for when so much zinc has been burned out as to allow the temperature to rise toward the fusion point of copper, 1,996 degrees Fahrenheit, the spelter

becomes unmanageable. It leaves a thick deposit on the outside of tubing and refuses to flow.

By reason of these safeguards the dip-brazing method is self-regulating and—far from presenting new dangers—offers a guarantee against all burning of steel tubing, which it has never been possible

sible. The spelter must flow into every crevice by the laws of gravitation. It is partly for the purpose of assisting this action that the movements of the operator in dipping are slow and gradual, so

this peculiarity, which has been brought out as an argument against the dipping method, is now by its advocates turned about and used as an argument against joints of such special formation. It is believed that constructors will be obliged to change their designs of joints to conform to the requirements of dip-brazing, but not vice versa.

**Depth of Dipping.**

In the illustration showing three frames, the extent to which the tubing is immersed is indicated by the spelter adhering to the tubing. When the spelter becomes low in the crucible ingots of spelter are added and are readily fused. It is not practicable to add pure zinc, and if the contents of the crucible have been watched there is no necessity for it. The depth of dipping is not a very essential feature in the process, and it is found in practice that sufficient spelter may be added in course of the work to keep the depth of the molten metal so nearly uniform that there is no practical difference between the joints brazed during a day's work. As the slushing of the metal against the sides of the crucible tends somewhat to wear away the graphite, of which the crucibles are made, it is not even desirable to keep the depth of the spelter absolutely uniform. The crucibles will last longer if a certain range of variation is allowed.

**Strength of the Joint.**

It has been said that the joints produced by dipping are less substantial than those made by flame-brazing. An amusing incident is mentioned in this connection. A manufacturer who was being initiated in the dipping method took up a joint just finished and cooled, struck the lug open with a cold chisel, placed the tubing in a vise and with a pair of tongs forced a part of the lug to one side, laying the spelter bare, as shown in the last illustration. "Do you call that brazing?" he said, contemptuously, and no argument would convince him that the brazing was perfect just because the spelter separated into two films, one adhering to the lug and the other to the tubing. Probably he expected that the spelter would tear away with it a scale of the steel tubing, as it frequently does when the tubing has been burnt in a gas flame.

The smaller one of the two seat cluster joints, shown in the illustration, was

Rear View of Furnace, Showing Doors and Feed Box.

to obtain by the flame-brazing method.

As soon as sufficient publicity shall have been given to this important point of superiority of dip-brazing, it is to be expected that every bicycle manufacturer who works with the dipping process will be anxious to make the fact known, so that agents and the public may learn that breakages of fork stems and crowns, such as were commonly reported during 1898 and were usually charged to bad brazing and burning of steel tubing, are extremely unlikely to occur with their product.

The same natural laws which prevent burning of the tubing in dip-brazing also insure economy in the filing department, for the spelter when used in its proper condition leaves only a very thin coating on the outline of tubes and one which may be much more readily removed by the combined effect of chemicals and filing, than the hard and heavy lumps which form so readily when the tubing, with the spelter adhering to it, is turned around in a gas flame and allowed to cool irregularly.

**Spelter Penetrates to Every Point.**

The regularity of the temperature, which affects all parts of the joints simultaneously, when dipped, also has the effect of making dip-brazing uniform and reliable. The weight of the molten spelter in which the joint is immersed assists capillary attraction. When the simplest precautions are observed to permit the escape of air, the formation of air pockets in the joints becomes impos-

sible. The spelter must flow into every crevice by the laws of gravitation. It is partly for the purpose of assisting this action that the movements of the operator in dipping are slow and gradual, so

upwardly while the spelter forces its way that all air may have a chance to escape

Results—The piece to the Right was Brazed by Dipping; that on the Left was Brazed by Flame.

into the joint from beneath.

With certain forms of construction it is, on the other hand, difficult or even impossible to make the spelter leave the joints properly, but so great is the economy claimed for the dipping process that

brazed carefully by the flame-brazing method, and it is characteristic that when it was torn open it showed good brazing only at one of the lugs, while no spelter at all had adhered to one side of the other lug.

# No Trouble to Show Goods

IT'S a pleasure to show them, and talk about them and write about them. That's one of the good things about good goods, goods that don't have to be apologized for (our kind). It's a pleasure, down-right enjoyment, to talk or write about them, dilate upon their beauty, explain their points of elegance in construction and contour.

If you haven't seen our lines for '99, write us and we will see that you have a chance to do so as quickly as our representative can reach you.

# Write Us, Anyway =====

Ask questions, make suggestions, criticize—anything you like, so we have a chance to talk our goods to you.

Let us hear from you and we will show you the handsomest and best goods ever offered since saddles were made; and prices are right.

### MAKING "THE WHEEL" RIDICULOUS

Quite unexpectedly the Wheel has heard from another superintendent—this time of the proper kidney—on the subject of brazing by immersion. His views are not in consonance with those held by our scatter-brained contemporary, but by as much as they disagree do they accentuate his ability to trim its ignorant pretensions. The editor of the Wheel, driven to despair in defending an untenable position, seizes upon this sarcasm of his correspondent and admiringly proclaims it "interesting"—much in the same manner as he might sniff at a nettle and laud it for a narcissus:

I wish to convince you that the much lauded brazing by immersion looks well on the outside and also that it looks better on the inside.

By this is implied that an effective joint can be obtained by dip brazing, and also that stripping the joint by means of chisel and mallet will afford conclusive proof of the thoroughness with which the parts were once united.

Since the Wheel saw fit to challenge the soundness of the opinions expressed in the Cycle Age concerning dip brazing we herewith parallel its stupid criticism and the essence of what was said in this paper, comparing both with the judgment of an experienced factory worker:

*From the Cycle Age of  
Dec. 15—*

There are now very few American bicycle manufacturers who have not experimented with liquid brazing, and a large number of them have finally adopted the method for a part of the brazing work in their factories. Among all the uncertainties and drawbacks to the method of which some of the experimenters have complained, this one fact stands out preeminent—that several factory men whose judgment on such things it is impossible to set aside as incompetent, pronounce the process of brazing by immersion a success mechanically and satisfactory as an improvement in shop economics. And they continue to employ the process. This one fact is preeminent because it overbalances all indications that point in the opposite direction, just in the same manner as the production of a missing person alive and well, disproves at once all rumors or theories according to which he should be dead.

Under the circumstances the process of liquid brazing may therefore now unhesitatingly be declared a success. The statement may be qualified by saying that it is a success only under the proper conditions and when properly done,

*From the Wheel of  
Dec. 29—*

From employes of several factories it is learned that the process of dipped brazing, to which our Chicago contemporary gave approbation last week, is proving far from satisfactory. It is claimed that unless the parts to be joined fit perfectly, the brass does not flow and the job is poorly done. The employes state that a considerable proportion of the work now going out of the factories in which they are employed is unreliable, and is bound to give trouble later on.

One superintendent, who had used, but is not committed to the process, states that thus far it has proven unsatisfactory, and considerably more expensive than another process he now uses. He showed The Wheel a number of frames which he had cut open, and they were imperfectly brazed. They look all right from the outside, but the brass did not flow throughout the entire joint. This superintendent states that the terrific heat of the molten brass is liable to burn the metal, weakening it at the joints. He also states that the process wastes a very large amount of brass and spelter, which are expensive, and that the expense of filing frames and the time required is much

*From The Wheel of  
Jan 5—*

"I have carefully read your article on dipped brazing in The Wheel of December 29. I wish to say that dipped brazing can be done successfully, and brazing by this process can be done better and at a much lower cost than it can be done by the old way.

"If at any time the brass gets hot enough to burn the metal immersed, then the zinc would at once burn out of the brass, and it is impossible to do any kind of work with the metal in this shape. Brass melts at a much lower temperature than steel, and in order to burn the steel the brass must be heated far more than it ever should be.

"A crucible of correct pattern will last from two to three weeks. These crucibles cost \$7.

"One man and a boy helper can braze 100 complete frames in ten hours. We are saving six cents per wheel on brazing alone, and \$7 a day on fuel. We use just \$1 worth of hard coal a day, and last year our gas bill for the brazing forges was from \$7 to \$8 per day.

"In the filing room we are saving 12 cents per frame as compared with last year's piece prices, and last year a filer ever made over \$2 a day and had to

but that is a limitation that may be applied to everything. \* \* \* Liquid brazing saves work and money for those best versed in the application of the process. No inference is left, then for those who have arrived at a different result but that they are not well versed in the process, or else that the conditions in their factories are very different from those prevailing in the factories where success has been accomplished. \* \* \* Manufacturers who have already made the process a success have no great inducement to publish the details of shop practice by which they have accomplished so much. \* \* \*

greater than even in the old process commonly used. Another great objection is that the crucibles burn out frequently. He has used the process off and on for five weeks and has burned up three crucibles, costing about \$10 each. He says he will experiment a little more, but he is confident the process will never prove satisfactory. He blames those journalists who boomed it before it was thoroughly tested, and claims that the majority of the factories have taken it up because they have been led to believe that it was cheaper and better. He criticised very freely the editorial on the subject which appeared in our contemporary last week.

pay for his files out of that. This year the filers make just about the same amount if not a little more, but we have many filers less than we had in '97, to turn out 100 frames and forks a day.

"I wish to say right here that anyone who undertakes this kind of a job must have some faith in it or else he might as well quit right now. We had just as much bad luck as anyone at the start and were discouraged for a long time, but we never at any time lost faith, and for that reason alone we are doing excellent work with this process, and every day saving a good round sum for the company."—*Extracts from a letter written by G. C. Worthington, Superintendent of Fay Mfg. Co.*

The Wheel emerges from the comparison shorn of some of its cheek and conceit—losses it can readily repair.

Not since the days when another dunce undertook to deter folks from using pneumatic tires has there been witnessed such an impudent attempt to forcibly arrest the progress of the cycle industry as vanity and malice toward the Cycle Age impelled our declining contemporary to essay.

### EXORBITANT EXPRESS RATES

If every bicycle dealer who sells 200 bicycles per annum has an average expense of \$350 for express charges, and every repairman pays an even much larger percentage of his gross income to express companies, it is evident that the retail bicycle trade is interested to the extent of very large aggregate amounts in an equitable system by which the exorbitant rates now paid for express shipment may be reduced one-half or more. The total amount now thrown into the maws of the four large express companies by the cycle trade cannot be much short of one and one-half million dollars annually. A saving of one-half would mean the addition of more than seven hundred thousand dollars to the purchasing capacity of the retail trade. Manufacturers who think that they can afford to stand aside and throw away the chance for such a betterment in the general condition of the trade, and who will forego all effort for bringing it about because they do not pay the charges themselves, have only learned the ABC of commerce. It was through neglect of work for bettering the general condition of the trade along such and similar lines that the National Board of Cycle Manufacturers came to its death.

Among the substitutes for express service which have been proposed, shipment by fast freight is foremost, but it is unfortunately practicable only between large centers of commerce. The majority of the cycle trade, being located in towns of smaller size, cannot take advantage of the work of fast freight associations. They have only Hobson's choice between one or another express company. Their position is further aggravated by the sixty day guarantee which is another of the evils that the National Board failed to abolish and which compels the agent to ship repair parts both ways in a great many cases when one shipment of a part for replacement should be sufficient.

The large majority of the trade has nothing to hope for from fast freight, but must rely for relief upon legislation by which either the express business may be reorganized on a basis consistent with modern business requirements, or urge the United States government to take it into its own hands to organize a parcels post. The concentration of industry jointly with the diffusion of civilized requirements in small towns and rural districts, increases the volume of express service rapidly from year to year, and the regulation of charges for transportation of parcels is therefore gradually growing into a problem of acute national importance. The cycle trade is financially interested in its proper solution more than perhaps any other branch of trade, and its members should therefore receive the movement which has now been started in New York for entering the problem upon the arena of local and national politics with all the attention to which

It is entitled. It may be labeled the Parcel Post movement, or it may become known under another name. Under whichever name it shall appear in politics it is well to remember that it spells hard dollars for the cycle retail trade.

\* \* \* \*

In many parts of the country it is believed that sales of bicycles will not increase in consequence of the reduction in list values. A dealer in West Virginia while voicing this opinion has remarked:

The trade is governed now by the natural laws of supply and demand. I don't think the reduction in price will cause much of a boom in the business. If it had come two years ago when the fever was raging it would have done lots of good. As many people ride nowadays as before, but they are not so anxious to have a new model every year. They ride a machine until it wears out. To tell the truth the bicycle business has got to be just like the buggy business. It is on the same basis and will continue to be steady from now on. There is more money now in repairing bicycles than there is in selling them. There will always be a good business in repairing bicycles.

Demand is so largely a matter of purchasing capacity that one unhesitatingly rejects this forecast of retail trade for the coming year. If it shall be proven that the buying capacity of the mass of people is as great as is cautiously inferred from the general revival in business, then assuredly bicycles will be sold in greater numbers, and their temptingly low prices will contribute powerfully to that end.

\* \* \* \*

If the United States foreign parcels post service was equal to that of Great Britain in scope, weight limit on packages to be transmitted, or rates, makers of cycle parts and sundries would be benefited greatly in their quest for foreign trade. The limited range of our foreign parcels post service is hardly less of a hindrance to the wide distribution of these goods than the provision in the laws of the United States which makes it impossible in many cases to use this service for packages weighing more than one pound. From Great Britain 11-pound packages can be shipped to almost any part of the world and, considering distance, much more cheaply than they can be sent from this country to markets in which each nation has equal postal facilities. To illustrate by the aid of countries to which we make extensive cycle shipments: British Guiana is 1,700 miles from us and 5,200 miles from England, yet on a pair of pedals forwarded to that point, weighing one pound, our postal rates would be 12 cents, while the English charge would be 20 cents, or twice as much, for carrying the package three times as far. Our cycle trade with the Hawaiian Islands is bound to be extensive, and yet with only 2,240 miles separating, as compared with 8,500 miles from England, a saddle packed so as to weigh not more than one pound would, if shipped from this country, cost 12 cents, as against 24 cents from England. A package weighing three pounds can be sent from the United States to Mexico at a postal charge of 36 cents, while from England, 5,000 miles away, the same package will only cost 24 cents.

\* \* \* \*

Shippers of bicycles and parts are in merry mood over the announcement of the intention to press the amendment of the Interstate Commerce Law and if possible secure a uniform classification of freights. There are three freight classification associations to whose edicts the bicycle shippers must bow—Eastern, Western and Southern—and although avowedly they act in harmony with each other, yet the stubborn fact remains that they reserve to themselves the privilege of doing as they see fit. From time to time they alter freight rates in various territories and regard such changes as without the control of the joint interests. It was in conformity to such license that last spring the Southwestern Traffic Association, which exercises control over freight south of St. Louis and Washington, D. C., established a new custom and charged double first-class rates on bicycles. Later, at the solicitation of the National Cycle Board of Trade, the classification was changed to one and a half times first class—the rate in vogue with the other two associations.

\* \* \* \*

Freight classification is determined by three factors—value, weight and bulk, rank being given the importance of each factor in the order named. Bicycles sell at \$50 nowadays. Buggies and vehicles are more expensive. But buggies, which are K. D.

(knocked down) in classification, are given the same rating as bicycles, and yet there is no such thing as K. D. to a bicycle. Chairs, on the other hand, are marked S. U. (set up). They are cheaper than bicycles, and yet the rate is the same as on bicycles. Desks ditto. There is enough conflict among the articles enumerated to prove the need for a thorough revision of freight classifications. The fact that 75 per cent. of bicycle shipments go by express is not an argument for the retention of the present system of discrimination. On the contrary, with the prospect of increased use of freight cars for such shipments there is all the more need for making the charges right. The railroads have firmly held to a belief—founded years ago when the profits of the industry were large—that bicycles can stand a heavier freight assessment than any other article of merchandise, and not content with this assumption, in spite of steadily declining price, they have carried their discriminating practices to all the branches of manufacture which have to do with cycle building and forced them to accept unjust classifications.

\* \* \* \*

Even after drawing upon the prominent tire markets for denials concerning their alleged participancy in the formation of a rubber trust, one is not at liberty to infer that its operations, provided it is formed, will not affect the bicycle industry. It is part of the plan to control the world's crude rubber supply. There are, however, certain difficulties in the way of accomplishing this part of the programme which, to use the language of the India Rubber World, would not be easily overcome by a single company. While the growth of rubber is confined to certain countries, the amount of territory involved is enormous. The area known to produce Para rubber is reported at more than 1,000,000 square miles, of which probably not more than one-fourth has ever been worked. Furthermore, the older districts never become "worked out," but constantly increase their production. These forests are reached by means of thousands of miles of navigable rivers, on which hundreds of steam vessels ply, representing an investment of millions of capital. The proposition to monopolize the rubber supply looks rather to controlling the market at Para, as operators in wheat deal with accumulations of stocks rather than with individual farmers. But a company which should gain control of all the rubber now existing, and even of all the producers now at work, in new fields, who would enter the business in such numbers that any attempt to control all of them would call for constant additions to the capital of the trust.

\* \* \* \*

None of the manufacturing firms which lately received letters from The Cycle Age asking for opinions on the show question will dare to taint their honor by avowing that the printed replies were "faked." For The Cycle Age has the originals in its possession.—*The Cycle Age*.

That doesn't constitute a denial that the anti-show letters run in the Chicago paper were written last summer or were addressed to the Board of Trade's secretary. The Cycle Age sneaks out of a direct answer. Let us ask what right the Cycle Age has to hold letters not addressed to itself.—*The Cycling Gazette*.

By the right arising out of this fact: The letters in question were addressed to the Cycle Age.

# Bicycle Time

# MILWAUKEE TIRES

PUNCTURE PROOF

Pneumatic  
Single Tube

Resilient  
Easy Riding

SHEBOYGAN, WIS., Dec. 11, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.

Gentlemen—I would like to say in regard to your Patent Puncture-Proof Tire, that they are everything they are represented to be, and have given me entire satisfaction.

Previous to getting your tire I had ridden five different sets in two months. Your tire has stood all the tests in rough handling and riding. They are a soft, easy riding tire, and I will ride no other but the Milwaukee Patent Puncture-Proof Tire.

Yours truly,  
(Signed) ARTHUR F. STEHN.

MANISTIQUE, MICH., Dec. 5, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co.,  
Milwaukee, Wis.

Gentlemen—Replying to your favor of 19th ult., will say, that I have ridden one of your tires 1128 miles on the rear wheel of my bicycle without a single puncture, the same being ridden over streets where some miscreants had put pounded glass and carpet tacks, and others were constantly being annoyed with punctures and bad cuts. Hence, will simply say that it has given perfect satisfaction in every respect and I would recommend them to all riders. Yours respectfully,

(Signed) A. VAN HARTER.

HUNTINGTON, W. VA., Nov. 28, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.

Gentlemen—I have been riding your tire since the first of September and judging from the satisfaction it has given me, I can truthfully say, "I regard it as the BEST TIRE on the market."

My vocation is such as to keep me on my wheel a good portion of each day and in all kinds of weather, and in your puncture-proof tire I have found such an article as to meet fully the demands of a constant rider and all conditions of roads.

Have ridden many other makes of tires, but now cheerfully recommend yours as the best which has thus far come under my observation.

Very truly yours,  
(Signed) J. C. LE SAGE,  
Carrier No. 2.

L. J. FLOTOW, Contractor and Builder.

OCONOMOWOC, WIS., Dec. 6, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.

Gentlemen. I have used your puncture-proof tires on my wheel for about 8 months. I do not know how many miles I have traveled on them, but with a view of testing them to my own satisfaction, used them recklessly, but find them unphased, and consider them as good to-day as when I commenced to use them. Respectfully,

(Signed) L. J. FLOTOW.

Representatives Wanted. Write for Prices and Other Information.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS., U. S. A.

## FEAR AMERICAN COMPETITION

### FRENCH INDUSTRIES IN DANGER

**Bicycle Makers Try to Save Themselves With American Machinery—Our Motor Vehicles Best.**

After having been denied admittance to the Paris cycle show the French firm which represents several of the leading American bicycle manufacturing companies appealed to the president of the show, but he upheld the former decision. The American agents then decided to open an exhibit in their own store, and two French houses offered the use of their rooms for displays. These offers were accepted and the thirty-nine different models of American machines, representing five different makes, were put on exhibition. These displays were free. If a fair comparison can be made in such a case the private exhibition was better attended than the national show, especially by agents coming from all parts of Europe, who examined the American goods critically and placed many good orders.

#### Customers Demand American Goods.

There was much discussion in the daily press regarding the Franco-American incident, and the comment was not by any means unanimously in favor of the Frenchmen. One paper observed that it was much to be regretted that "such a good opportunity was given the Americans to show their goods." The discussion had also given too good an opportunity to many dealers in European countries to voice their opinion of American made machines. One prominent Belgian dealer stated in print that during the many years he had been in the cycle trade he had handled French, German, English, Austrian, Belgian and American bicycles and a line of bicycles made by himself, but now he sells none but American made bicycles, as his customers prefer them because they are stronger, better made and cause less annoyance than any of the others. Another big dealer in Berlin wrote that it is almost impossible for him to get enough American bicycles to supply the demand, and that unless the government takes serious steps towards increasing the duties the Americans will, inside of two years, be the masters of the bicycle market in Germany and have killed the competition of the home makers.

#### Using American Machinery and Material.

The same complaint is made by the French makers. One of the latter says: "We do not pretend to make the best bicycles in the world, but we tell our customers that what constitutes the quality of the machine is the science of the workman and the material employed; that we make use of the best machinery obtainable, and if there is any that we have not we will send for it. We are using machinery from ten firms in the United States and last year bought \$20,000 worth of American material, and are willing to get more if there is any of good quality which we have not. Then we will see if we cannot produce as good bicycles as the Americans make."

#### Automobile Trade Threatened.

A Paris daily paper, after pointing out the supremacy of our bicycles in the markets of Europe, asks how it will be with automobiles. "We have received news from our countrymen in Boston, New York and Chicago, saying that the automobiles seen there were much better, finer and less clumsy than any French automobiles and that the Americans were well prepared to compete in every respect with French or European motor vehicles. It is to be hoped that some measures will be taken to prevent the American makers

from dominating the French trade in automobiles as they have had the opportunity to do with their bicycles. Even if we do not make these vehicles as handsome and neat, it should not be an excuse for letting our own industry die out."

### CYCLE ENGINEERS' INSTITUTE

**In England the Cycle Engineers have Finally Agreed Upon the Qualifications for Members.**

The preliminary work of forming the Cycle Engineers' Institute in England is at an end. Candidates for admission as active members must "be persons not under twenty-five years of age, who, having occupied for at least four years a responsible position in connection with the science or practice of cycle engineering, or having done service which may be deemed equivalent, and being at the time of their application actually engaged in the science or practice of cycle engineering, may be considered qualified for election."

Candidates for admission as associate members must possess practically the same qualifications, except that the clause as to having occupied for four years a responsible position is omitted, and "having been engaged in such work as is connected with the science or practice of cycle engineering" is substituted. They may afterwards be transferred to the class of members.

Graduates are defined as "persons not under eighteen years of age, who are, or have been, pupils of, or who are proposed by corporate members;" while candidates for admission as associates "must be persons not under twenty-one years of age, who, from their position in connection with the science or practice of cycle engineering, may be considered eligible."

There is another clause which provides that "candidates for admission as members, associate members, or graduates may be called upon to prove by examination their knowledge of the principles of cycle engineering," but this clause will only be enforced in exceptional cases.

### HOLIDAY SIDE LINE TRADE

**Buffalo Cycle Dealers Pleased with Christmas Sale of Athletic and Photographic Goods.**

The value of a good side line in a cycle store was most thoroughly demonstrated during the holiday season in Buffalo, where every establishment with a side stock did a very gratifying business. A heavy trade was done in athletic and amateur photographic goods, particularly in the latter, much to the disgust of the exclusive photographic supply people. A very satisfactory business was also done in the bicycle trade, more machines having been sold than ever before at Christmas time, which is looked upon as a good omen.

Speaking on the question of side lines, a bicycle dealer said: "Sell a person a camera and he is sure to come back to your store for supplies. We give our customers the privilege of our dark room, and where it is desired we do the printing and developing for them, making a charge to cover materials used. We catch those that do their own work and those that do not, and in this way scores of young people visit our store daily. They are all wheelmen and wheelwomen, and the chances are even that when the riding season approaches we will be able to interest them in our bicycles. It is a business that is growing rapidly. It knows no 'dull periods' and yields a good profit."

The plant of the McKaig-Dorntge drop forging company of Buffalo was destroyed by fire January 2, at a loss of about \$25,000, which is partially covered by insurance.

## BUFFALO'S LARGE BLACKLIST

### SECOND HAND STOCK COMMON

**Fifteen Hundred "Bad Pay" Customers—Cause Dealers Heavy Loses—Machines Misrepresented.**

Buffalo, Jan. 9.—The names of more than 1,500 persons of this city appear on lists that have been submitted to the local board of trade by dealers, to be listed in the record of bad accounts that is made up yearly and furnished to those of the trade that hold membership for their guidance in selling on the credit system.

Concerns that sold on the long-time-payment plan and those that handled cheap grades are the heaviest losers, more than two-thirds of those whose names appear on the list being customers of these establishments.

Many of the persons whose names grace this document, it is said, bought under misrepresentation. Inferior grades of bicycles were sold them at high grade prices and when they discovered the trick they discontinued their payments and the machines were either returned voluntarily to the seller or the buyers suffered them to be taken from them.

#### Dealers Forget the List.

With some hundreds of others on the list it has been the custom to secure a mount on the long-time-payment contract and after paying \$10 or \$15, which under this plan would be about the amount paid at the close of the season, refuse to make further payments and the dealer would be forced to take back the machine which would then be second hand and which had to be sold at a loss. These people appear on the list each year and it would seem that dealers would profit by the experience of others, but in the eagerness of the average dealer to make a sale the "slow pay" or "dead beat" characters on the list are overlooked.

As a result of these conditions there are many second hand bicycles going into stock on which much loss will be sustained.

#### Rex Cycle Co. in Sheriff's Hands.

The factory and stock of the Rex Cycle company of Chicago, which manufactured three-wheeled anti-vibration bicycles at Seventy-second and Wallace streets, was taken possession of by the sheriff last Saturday morning on an attachment writ for \$27,456.67. The claim is for money advanced on notes and the assets of the company. The retail store at 280 Wabash avenue was vacated about a month ago.

#### Spaulding Screw Plant in Operation.

The Spaulding Machine Screw plant of Buffalo is being operated by Mr. Keim, who recently bid it in at foreclosure sale. It is not known whether he will operate it permanently or not. A large number of orders remained unfilled and with those received since the sale there is now enough work to keep the plant busy for some time.

#### Will Purchase a Going Business.

Mr. Samuel Snell is desirous of purchasing a going business of moderate size. He would not object to buying an interest in a concern whose directors appreciate the value of an experience in the cycle trade such as he possesses. Any firm desirous of communicating with Mr. Snell is at liberty to address him at Toledo.

The attendance at the Paris cycle show, which closed December 26, was almost 70,000, the greatest daily attendance having been 22,000, admitted on Wednesday, December 18.

# THE CHICAGO CYCLE SHOW

## Sundries and Accessories More Fully Represented than Bicycles—The Exhibition in Detail

Last Saturday evening the Chicago cycle show, promoted and managed by N. H. Van Sicklen, was opened to visitors in the Keith building on Wabash avenue. It occupies two floors and comprises besides bicycles, cycle sundries and accessories, also motor vehicles.

A portion of the space is set aside where the exhibitors of the motor vehicles may drive up and down, steering their way adroitly around pillars and other obstacles. The same space is utilized by riders of the Giraffe bicycle, carrying an advertisement, and other bicycle riders who are showing special machines such as one of the Cantilever pattern and one geared to 324, and by anybody who desires to try other exhibits, especially saddles, by actual riding. This department absorbs much of the public's attention, but it is stated by many exhibitors that the show is also giving satisfactory results from a trade standpoint.

### Local Tone Apparent.

In general effect it is in no way to be compared with the National shows of former years.

The limited space alone effectually prevents any general impression of splendor and magnificent proportions. The absence of the majority of cycle manufacturers who are not identified with Chicago, imparts a distinctly local character to the exhibition. It is a local Chicago show, where, however, many wholesale dealers in sundries find it convenient to congregate to compete for the trade of dealers. The net results of the show, considered as a trading ground, cannot yet be estimated.

The public's attendance has been small in the daytime, but sufficient to fill the space comfortably in the evenings. No great enthusiasm has been manifested by the visitors, but the mere fact that several thousand Chicago people have proved willing to pay an admission to see cycles and cycle accessories in the month of January, appears to have inspired the trade in Chicago with more hopes for a brisk spring-retail trade than were entertained before the show was opened.

The early consummation of wholesale deals has been one of the chief topics of conversation among the exhibitors. By comparison of notes it seems to have been found that nearly all manufacturers had disposed of an unusually large percentage of their products before January 1.

From the following brief account of the show, the trade at large will be enabled to form an estimate of its general character, and of the scope of the business of each exhibitor. In several instances it was found impossible to make the list absolutely complete, nobody being present at the stand when The Cycle Age reporter called; but the few omissions which are due to this cause, are of small significance for forming a generally correct idea of the character of the exhibition as a whole.

### American Chainless Wheel Co., Chicago.

Stand 155.—The exhibitor is located at 53 Dearborn street, Chicago, and shows an anti-shock bicycle with one 28-inch driving wheel, a 16-inch trailing wheel and a 20-inch steering wheel. The weight of it is to be reduced to about 22 lbs. The model shown weighs 32 lbs. It

is similar to the Rex bicycle in principle but shorter.

### Acme Mfg. Co., Reading, Pa.

Stands 7 and 8.—Exhibits: Stormer and Pennant bicycles and Mars, a \$25 model, and a double diamond tandem convertible to combination. Several points of equipment which were formerly used on Stormers only are now also features of the Pennants.

Model.	Style.	Retail Price.	Wt., lbs.
Stormer men's 25.....	Chain	\$40	24
Stormer ladies' 26.....	Chain	40	25½
Pennant men's 21.....	Chain	35	26
Pennant ladies' 22.....	Chain	35	26½
Mars. 27.....	Chain	25	26
Mars 28.....	Chain	25	27
Stormer juvenile 1 and 2.....		20	..
Stormer juvenile 3 and 4.....		25	..
Stormer tandem.....	Combination	60	48

### American Electric Vehicle Co., Indianapolis.

Stand 62.—The vehicles manufactured by this firm are driven by storage batteries and are mainly of the light road wagon pattern mounted on bicycle pattern wheels.

Model.	Style.	Retail Price.	Wt., lbs.
Runabout .....	Electric	\$1,000	900

### C. K. Anderson, Chicago.

Stand 121.—Exhibit: E-Klips toe clips, Chalfant saddle clamps, Collin's child's seat, mother of pearl grips, Ventilated Grip Co.'s sponge rubber, flexible Perfection and Relief grips in several styles and coverings, Frederick's adjustable handle bar, Dexter parcel and camera carriers, Red Cross cements, enamels, supplies, ovens, vulcanizers and brazers, Shirley's detachable dress guards, Lobdell maple single piece rims and guards, and Climax pumps.

### Ariel Cycle Mfg. Co., Goshen, Ind.

Stand 121.—Several models of men's and ladies' Ariels all having flush joints and nicked arch crowns are exhibited. The hanger parts hubs, etc., are of home manufacture. The company also make a pair of machines fitted with the Sager roller gear.

Model.	Style.	Retail Price.	Wt., lbs.
Men's 50 .....	30 in. wheels	\$65	25½
Racer 51 .....	Chain	60	21½
Men's 52 .....	Chain	50	24½
Ladies' 53 .....	Chain	50	24½
Men's 54 .....	Chain	40	25

Tandem 56 .....	Double diamond	75	46
Tandem 57 .....	Combination	75	48
Men's 58 .....	Sager Chainless	75	26½
Ladies' 59 .....	Sager Chainless	75	26½

### Eugene Arnstein, Chicago.

Stand 5.—This firm exhibits in a general way a representative collection of its large sundry line, which is recognized as one of the most complete from which the retail dealer may draw his supplies. The firm expects no special results from the show, but is represented merely to avoid invidious comparisons. Location of exhibitor, 86 and 88 West Lake street, Chicago.

### Artemis Plating Works, Chicago.

Stand 70.—Exhibits: Many styles of plain, ram's horn and adjustable bars, seat posts and Artemis hubs, and rat trap and combination Runaway pedals. Bar stems are shown with and without expanders.

### Badger Brass Mfg. Co., Kenosha.

Stand 73.—The well known Solar lamp exhibited here, while not so small and light as some of the more recent acetylene lamps placed on the market, merits the

distinction of being very reliable and safe in its operation and of burning for a long time without recharge. The two styles of carriage lamps also exhibited are in operative principle but enlarged patterns of the cycle lamp.

Model.	Style.	Retail Price.	Wt., oz.
Solar cycle lamp.....	Acetylene	\$3.50	31
Solar coach lamp....	Acetylene	15.00	pair.
Solar dashb'd lamp..	Acetylene	9.00	pair.

### Beckley-Ralston Co., Chicago.

Stand 41.—Exhibits: D. & J. and Fauber hangers, Thompson frame sets and fittings, Crosby & Mayer's fittings, Bridgeport and Baldwin chains, Gordon and Brooks' saddles, Solar, Pony and Brilliant acetylene lamps, 20th Century gas and oil lamps, Excelsior spokes, Claus handle bars, rigid handle bars, Star and Record pedals, W. & E. hubs and expanders, Smith hubs Diamond tires and Shelby steel tubing.

### David Bradley Mfg. Co., Chicago.

Stand 63.—The line of bicycles displayed has as its leader the well known truss frame America. The company is acting along the same line as are many other makers in that it builds several cheaper priced patterns so that agents handling the America need not buy their lower priced machines from other houses. A 30-inch wheeler is also shown.

Model.	Style.	Retail Price.	Wt., lbs.
America men's 27....	Truss frame	\$50	24
America ladies' 28....	Truss frame	50	25

Tandem 26.....	Combination	100	48

### A. D. Brewster, Chicago.

Stand 137.—This firm handles Lloyd's two-piece hanger fittings and makes a specialty of frame sets ready for assembling. He also carries the following finished bicycles:

Model.	Style.	Retail Price.	Wt., lbs.
Men's and ladies....	30 in. wheels	\$40	25

### Brown-Lewis Cycle Co., Chicago.

Stands 33 and 40.—This company has acquired control of the Marion, Ind., bicycle factory where Halladay bicycles were made. This name will be continued by Brown-Lewis company. They also make Syrian bicycles and have the Western agency for Keating bicycles, which are recognized as one of the most popular in the East among high-grade machines. Two models of Windsor bicycles of Charles H. Sieg's manufacture are also marketed by them as during the past year.

### W. J. Buckley & Co., New York.

Stand 149.—W. J. Buckley & Co. who hold the Electro company's western agency make an attractive sale exhibit entirely devoted to demonstrate the virtues of the well-known, small-sized Electro acetylene lamp.

Model.	Style.	Retail Price.	Wt., oz.
Electra lamp .....	Acetylene	\$3.50	14

### Bullis Ball Gear Co., Rochester.

Stand 154.—The company exhibits the Bullis ball-roller gear, which was recently described in this paper, and also Duckworth chains, and C. & T. one-piece hang-

ers, C. & T. expanders and C. & T. seat post clusters.

Model.	Style.	Retail Price.	Wt., lbs.

**Cantilever Cycle Works, Chicago.**

Stand 156.—The exhibitors who are located at 30 E. Washington street, Chicago, have the sole U. S. agency for the Pedersen Cantilever bicycle, somewhat modified, which is being built to order for \$75 at 937 Western avenue. The capacity of the factory will depend upon orders. The handlebar in the new model is adjustable. The makers will use pedals, hubs and hangers of substantial construction, and the bicycle will weigh complete 17 to 18 lbs.

Model.	Style.	Retail Price.	Wt., lbs.
Men's roadster....	Cantilever frame	\$75	17
Men's roadster....	Cantilever frame	75	18
Men's roadster....	Cantilever frame	75	19
Ladies' roadster..	Cantilever frame	75	15½

**Carlisle Mfg. Co., Chicago.**

Stand 142.—The Carlisle company continues to make a specialty of racing machines fitted with 30-inch rear and 28-inch front wheel, among their other models. They are building up a considerable trade in completely equipped juvenile machines and exhibit "the smallest bicycle in the show."

Model.	Style.	Retail Price.	Wt., lbs.

Carlisle racer.....	Chain	65	19

**Chicago Handle Bar Co., Chicago.**

Stand 34.—The principal novelty of interest to the trade is an addition to the company's large variety of bars representing its own construction in the form of the well known Ideal pattern which the company is now prepared to manufacture under Pope license.

**H. W. Coolidge & Co., Chicago.**

Stand 52.—The exhibiting firm is western representative of Kokomo Rubber Co., who make Defender Special, Clover-Leaf and Oxford tires, the Newark Cycle Specialty Co. and the Frank E. Bundy Lamp Co. The exhibitor's location is 135-137 East Lake street, Chicago. Further details of the lines carried by this firm will be given in a subsequent issue of this paper.

**Cushman & Denison, New York.**

Stand 47.—The leading oiler in the exhibit is the "Perfect." which is in the form of a small round cylinder when closed and is fitted with an oil stop arrangement so that it is impossible for the oil to leak out into the tool bag or rider's pocket.

Model.	Retail price.
Perfect oilers .....	\$.25
Star oilers .....	.10
Leader oilers .....	.10
Gem oilers .....	.05

**G. W. Cole & Co., New York.**

Stand 49—Exhibit: Cole's well-known "3-in-one" cycle oil, puncture healing fluid, chain lubricant, and such cycle equipments and sundries as toe clips,

baby seats, luggage carriers, nipple wrenches and spring seat posts. All articles are of Cole manufacture.

**Cutting & Kaestner, Chicago.**

Stand 165.—Saddles and toolbags form the exhibit. The firm is dealing partly through wholesalers and partly through bicycle manufacturers. Lately the company has also built up a considerable export trade.

Model.	Style.	Retail Price.	Wt., oz.
Cutting A.....	Racing	\$2.50	16

**Edmonds & Wetzel, Chicago.**

Stand 138.—This firm shows the Perpetual Pedal, which consists of only four parts. The bearings are similar to hub bearings at both ends of the spindle, spin perfectly and are well adapted to resist wear. The company is located at 115 Monroe street, Chicago. A description of their pedal will be found in a subsequent issue of this paper.

Model.	Style.	Retail Price.	Wt., oz.
Men's .....	Rat-trap	\$3.00	12
Ladies' .....	Combination	3.10	14

**Excelsior Supply Co., Chicago.**

Stands 17 and 25.—Exhibits: Everything for building bicycles. Having built up a very substantial trade with dealers and builders who operate on a large scale, the Excelsior company has found the show a good opportunity for proving to the trade that they have acquired exceptional facilities for reaching a large class of trade, whom jobbers usually fail to secure. Thus Thompson fittings, Shelby tubing, Gilliam saddles, Aurora fittings, etc., are found represented in their exhibit, notwithstanding other representation of the same lines.

**Fanning Cycle Mfg. Co., Chicago.**

Stand 23.—Exhibits: Fanning bicycles. The leading color in frame and equipment is cardinal red. Among construction details a new two-piece hanger with hollow axle and a simple form of fastening is noticeable. The "Trilby" sprocket design is used throughout and is patented. A new system for securing cups in hanger and hubs is employed.

Model.	Style.	Retail Price.	Wt., lbs.

Racer .....	Chain	50	21

**W. H. Fauber, Chicago.**

Stands 38 and 45.—The exhibit of the Fauber one-piece hanger is sufficiently imposing to leave a lasting impression on everyone who sees it, representing the well-known patented Star design of sprocket together with the hanger in colossal size and a new-clover-leaf design of sprocket carried by a statuary figure. The whole forms a rotating monument of one-piece hanger success. The application of one-piece hangers to multiple machines is shown in another part of the exhibit.

**Fischer Equipment Co., Chicago.**

Stands 55, 56 and 57.—The exhibit of Woods' Motor Vehicles comprise an electric hansom, an electric Stanhope and an electric Runabout, all equipped in this company's excellent style. On the second floor of the show building an opportunity

is given visitors to ride in another carriage of this manufacture and ascertain how much superior they are to horse-drawn vehicles in regard to easy management, steering and stopping.

Model.	Style.	Retail Price.	Wt., lbs.
Hansom .....	Electric	\$3,050	2,600
Stanhope .....	Electric	1,625	1,250
Road wagon.....	Electric	750	1,100

**Fowler Cycle Works, Chicago.**

Stands 1, 2, 9 and 10.—Frank Fowler's large exhibit is a bright-colored spot in the show. Sunbeam spokes, Thompson diamond forks, red enamel, good nickeling profusely employed, and effective decoration and sale tickets combine to attract the eye. It is said that Mr. Fowler will very soon have his entire product for next season ready at the factory and will then commence to astonish the world by pushing the sale department.

Model.	Style.	Retail Price.	Wt., lbs.
Sunbeam men's .....	Chain	\$41.50	25

**B. F. Goodrich Co., Akron.**

Stand 48.—The Goodrich company exhibit a full complement of the tires of their manufacture as scheduled below. They are confident of reaping the benefit of a policy which refused to mix rubber with foreign substances to such an extent that repair of tires became impracticable. As a result some of the Goodrich tires are this year specified even for cheap bicycles.

H. A. Lozier & Co., Toledo.

Stand 16.—Aside from the models exhibited the chief feature of the stand is an ingenious arrangement with billiard balls for illustrating the advantages of the Burwell ball separating device which is used in the hubs and hangers of Cleveland bicycles. The demonstration never fails to convince on-lookers of the merit of a ball-bearing system, by which the revolving of each ball in a bearing is prevented from antagonizing the revolving of the adjacent balls. The company will shortly place a Cleveland pattern fitted with Sager gear in the market.

A. D. Meiselbach, No. Milwaukeee.

Stands 27, 28 and 29.—The exhibit comprises a large number of sizes of Earl models in grades A and B. They are all fitted with Kundtz rims. This and a new hanger for grade A are about the only new points in construction. The details of fittings and manufacturing methods are laid open for all visitors in so far as possible.

Model.	Style.
Earl men's A.....	Flush joint.
Earl ladies' A.....	Flush joint.

Montgomery Ward & Co., Chicago.

Stands 122, 123, 124—Exhibits an assortment of guns, ammunition and sportsmen's goods.

Monarch Cycle Mfg. Co., Chicago.

Stand 46.—The only notable new features in the construction of the Monarchs exhibited are the handle bar expander and the seat cluster and rear fork construction whereby the appearance is made neater than heretofore. The new double diamond tandem may be readily changed from double to single steering and presents as neat an appearance when the steering connections are removed as when they are in place.

**M. H. Naber & Co.**

Stand 128.—The exhibitor has commenced the manufacture of saddles in which the spring is arranged in a new and seemingly very appropriate manner, the details of which cannot be published at present, foreign patents being pending. The maker is located at 56 Fifth avenue, Chicago.

Model.	Style.	Retail Price.	Wt., oz.
Large men's	.....Torsion Spring Support	\$3.00	18
Small men's	.....Torsion Spring Support	3.00	16
Ladies	.....Torsion Spring Support	3.50	16

**National Cement & Rubber Co., Rochester.**

Stand 65.—In the exhibit are two patterns of High Pressure brazers, a double walled enameling oven, steam vulcanizers, and a full line of the firm's rubber and wood rim cements.

**O. P. Nelson, Chicago.**

Stand 157.—The exhibitor who is known as the winner of the Chicago road race in 1896 shows a number of \$50 bicycles of his own manufacture and a quadruplet.

Model.	Style.	Retail Price.	Wt., lbs.

Tandem	.....	80	40
Quad	.....	175	90

**Newark Cycle Specialty Co., Newark.**

In the saddles shown in this exhibit no especial attempt at novelty in design has been made, it being the plan of the company to furnish two popular patterns of saddles in substantial form at moderate figures.

Model.	Style.	Retail Price.	Wt., oz.
Oaks	.....Brooks pattern	\$2.00	18
Newark special	.....Padded	1.50	16

**Otis Bicycle Co., Chicago.**

Stand 26.—Exhibits: Otis bicycles in three grades. Thirty-inch wheels are a prominent feature in the highest price, the \$50 model, for men and women. The hubs in these patterns are of Tazewell manufacture, in which the ball travel is reduced to the least possible, thereby reducing friction. The hanger is the Ewald pattern, with eccentric chain adjustment.

Model.	Style.	Retail Price.	Wt., lbs.
Men's special	.....30 in. wheels	\$50.00	25
Ladies' special	.....30 in. wheels	50.00	25

Leader ladies'	.....Chain	27.50	24

**Overman Wheel Co., Chicopee Falls.**

Stand 43.—Exhibits: Victor bicycles. These are made with all parts interchangeable when possible. Only one grade is produced, and a great economy is thereby effected. Nuts, washers, axles, etc., from the diamond frame model may be used for the drop frame model or for a diamond frame of different size. Every effort is made to save by economical shop practice what is expended in high-class material. In these words the company's whole policy is expressed.

Model.	Style.	Retail Price.	Wt., lbs.
Victor men's (43)	.....Chain	\$50	23½
Victoria ladies' (44)	.....Chain	50	25

**Pauli Mfg. Co., Chicago.**

Stand 164.—The exhibit is the Pauli Bright Light acetylene lamp, which is so constructed that the water has but one fixed ratio of feed, so far as any action of the rider is concerned. He cannot increase or diminish the flow, but the gas pressure regulates the flow automatically through back pressure operating by means of an air pocket and water lock.

A complete description of this feature will be found in a subsequent issue of this paper.

Model.	Style.	Retail Price.	Wt., oz.
Pauli lamp	.....Acetylene	\$3.50	21

**Park City Mfg. Co., Chicago.**

Stand 135.—The exhibit is composed of the company's D. & J. two-piece crank hangers in which the parts divide at the right end of the axle. Hangers for single machines and for multiplerts are also shown, the display including groups of hangers built into the lower parts of multipler frames.

**K. Peterson and F. A. Hastings & Co., Chicago.**

Stand 22.—Mr. Peterson exhibits Baldwin chains, P. & F. saddles, Kirkpatrick saddles and Worcester Ferrule & Mfg. Co.'s fittings, Columbia Mfg. Co.'s lap-brazed tubing. The Hastings Co. exhibits goods made by Stockton Mfg. Co., Louis Rastetter & Son, the line carried by Hermann Boker & Co., and the grips made by Grand Rapids Grip company. The two exhibiting firms are popularizing these lines with wholesale dealers. Location of exhibitors, 159 Lake street, Chicago.

**Plew Saddle Co., Chicago.**

Stand 71.—The Plew soft-nosed saddle is still the principal article made and marketed by this firm. But around this nucleus a considerable sundries business has been built up comprising, as shown by the exhibit, Duthie chains, Excelsior balls, Eli and Elyria pedals, Indiana chains, India tires, Collmer hubs, Behse wood guards, Perfection chain guards, and Robinson grip fasteners.

Model.	Style.	Retail Price.	Wt., oz.
Plew men's	.....Pneumatic pommel	\$2.50	16
Plew ladies'	.....Pneumatic pommel	2.50	16

**Pope Mfg. Co., Hartford.**

Stands 30, 31 and 32.—The Chicago branch, which is now also distributing center for supplying agents throughout a large western territory, makes a representative exhibit of all the company's models, among which the bevel-gear chainless attracts most attention. The New Departure brake which is optional on nearly all the patterns also arouses the interest of agents.

**W. W. Rathbun, Chicago.**

Stand 120.—The flexible rim wheel called The Rathbun is fitted to a bicycle at this stand. It consists of a very rigid inner wheel built on the suspension principle. Surrounding this concentrically at a distance of about one inch is a flexible rim held by sliding bolts in such manner that it can be pressed toward the inner rigid rim at any one point, but cannot be pulled away from it at any point. Consequently, the outer flexible rim yields and flattens at the point of ground contact, giving an elastic support to the rider. The device is intended to supplant the pneumatic tire.

Model.	Style.	Retail Price.	Wt.
Men's	.....Flexible rims	\$100.00	24 lbs.
Ladies'	.....Flexible rims	100.00	25 lbs.
Absorbent grip	.....	.50	
Equalizing saddle	.....	3.50	16 oz.

**W. R. Rollins Mfg. Co., Harvard Ill.**

Stands 161 and 162.—This company is interesting dealers on very cheap propositions, cash-in hand being a sine qua non. Three crown frames, stripped of

tires, saddles, toolbags and pedals are offered at prices which scandalize that part of the public who do not stop to figure and bicycles of ordinary frame construction at 33 percent less. The company is subsidized by the town where it is located.

**Sanford & Pollock, Chicago.**

Stand 153.—The leading article shown is the Solitaire acetylene lamp, which burns four hours, and weighs but 8 ounces. Webb Double Grip adjustable handle bars, Webb expanders, Flexa repair kits, and a line of New Brunswick tires are also exhibited.

**Schumacher Acetylite Lamp Co., Chicago.**

Stand 60. Positive water regulation, long period of burning without recharging the carbide chamber, non-disturbance of flame by jars and light weight are features of the lamp shown in this exhibit.

Model.	Style.	Retail Price.	Wt., oz.
Acetylite lamp	.....Gas	\$3.75	14½

**Snell Cycle Fittings Co., Toledo.**

**George G. Spencer, Chicago.**

Stand 60.—The exhibit comprises the line of plain handle bars in round and octagon tubing, and the adjustable bar made by the exhibitor. Some of the patterns shown are finished in fancy effects. Exhibitor's location is 165 Jackson street, Chicago.

**Star Mfg. Co., Carpentersville, Ill.**

Stand 165.—In this exhibit is shown the "Best" wrench intended for the use of cyclists. It is a combination tool comprising a light wrench, screw driver, nipple grip, caliper rule and alligator wrench. It is not designed for repair shop use. A light bench and adjustable alligator wrench is also shown.

**Chas. E. Sterner & Co., Chicago.**

Stand 136.—Janesville spokes, Merri-man rim washers, Greencastle rims, Ellis chain adjusters and oil cans, Noonan repairers' tools, form the principal sun-

## STERLING CYCLE WORKS, KENOSHA, WIS.

dries articles handled and exhibited by this firm, which also does a nickel-plating business and handles the following bicycle models:

Model.	Style.	Retail Price.	Wt., lbs.
Export men's and ladies..	Chain	\$35	25
Export men's and ladies..	Chain	25	24
Export men's and ladies..	Chain	20	24

Swanson & Ashbaugh, Chicago.

Stand 61—This company does enameling and nickeling for the trade, and makes a specialty of contract work for factories. It has on exhibition samples of tubing enameled and nickeled in various colors and effects.

Truscott Boat Mfg. Co., St. Joseph.

Stands 58 and 59.—This stand contains a gasoline motor launch made at St. Joseph, Mich. The exhibitor finds that cycle shows offer very good opportunities for getting orders for his line of goods. The launch exhibited is priced at \$300.

Tugwell Mfg. Co., Chicago.

Stand 138.—The exhibitors make exclusively the Tugwell hubs, in which the cones revolve with the hub shell, while the cups are secured on the axle. This reversal of the usual relative position of the bearing members reduces the travel of the bearing balls and thereby the friction.

Model.	Style.	Retail Price.	Wt., oz.
T. M. C. high grade....	Cone revolving	\$5.00	26
Racer .....	Locked cone	4.00	20
T. B. ....		2.50	26

Western Camera Mfg. Co., Chicago.

Stand 139.—The exhibit comprises twelve patterns of Cyclone cameras, all adapted for use by cyclists. The prices on these cameras range from \$3.50 to \$50.

Wheeler Saddle Co., Detroit.

Stand 24.—The exhibit shows a great variety of finish, but the line of the Wheeler company, as marketed, includes only four styles, the Wheeler Extra, women's and men's, the Corktop racing saddle, and the Special semi-racer. These are all finished in tan or black, except that a special finish in Scotch plaid, is obtainable at an additional price. The company aims to produce a line which will cover all needs of the bicycle manufacturer without incumbering him with a needless variety of stock. T. J. Beauvion and F. S. Wheeler are in charge of the exhibit.

Model.	Style.	Retail Price.	Wt., oz.
Men's extra.....	Hair padded	\$1.40	22
Women's extra.....	Hair padded	1.50	24

Men's cork top racer, Cork pad'd		1.40	20

F. C. Wilson, Chicago.

Stand 129—Exhibits a complete acetylene gas generating machine for lighting dwellings. The machine shown, called the Acetogen, is listed at \$90, and is guaranteed to supply twenty burners with dry gas constantly. The machine is in operation at the stand.

Allen Winch, Chicago.

Stand 129—Exhibits: Dazzle acetylene lamps, built in the form of combined house and cycle lamps. The water reservoir being below the combustion chamber, the latter can be removed, and an ordinary lamp shade substituted. There is no danger of the lamp tipping over when being used on a table. Exhibitor's address is P. O. box 1209, Chicago.

Rules for Calcium Carbide Trade.

With a view to preventing possible explosions of acetylene gas at fires as a result of water from the fire hoses coming in contact with calcium carbide, the fire commissioners of New York have formulated rules governing the storage and sale of the carbide. These regulations require that all calcium carbide in transit through the city and in storage must be in hermetically sealed iron receptacles and marked plainly "Calcium Carbide. Dangerous if not kept dry." No single package must exceed 100 pounds. Not more than 20 pounds, either in bulk or in cart-ridges, can be stored or kept in any building used for a dwelling or mercantile pur-

pose, and this amount can only be kept on a permit obtained from the fire department, which will provide that quantities in cases of two pounds shall be in tight metal packages and kept elevated at least six inches from the floor in a fireproof safe above the street grade. The manufacture, transportation, storage, selling or use of liquefied acetylene is absolutely prohibited within the city limits. Provision is made for the storage of calcium in sealed receptacles in quantities not exceeding 100 pounds in isolated buildings of fireproof construction. The storage must also be with a permit from the fire department, and the entire quantity stored must not exceed 500 pounds in the aggregate.

AMERICAN AND ENGLISH EXPORTS

Shipments from New York to Northern Europe Continue Heavy—English Machines Go to Australia.

Syracuse Board of Trade Election.

At the annual meeting of the Syracuse Cycle Board of Trade the following were elected members of the board of directors: H. E. Maslin, A. R. Peck, W. H. Olmsted, William Spalding, J. W. Gould, A. R. Dickinson, D. McCarthy, W. D. Andrews, J. C. Bowe, Charles W. Wood and William P. Butler. The officers named were: President, H. E. Maslin; vice-president, William Spalding; secretary, W. D. Andrews; treasurer, W. H. Olmsted.

Must Cancel Stamps With Date of Use.

Washington, Jan. 9.—It has been discovered that old documentary and adhesive internal revenue stamps were being reused, and the commissioner of internal revenue has therefore issued a regulation which requires all such stamps to be canceled with the day of the month as well as the initials of the user, and the month and year.

# COMMERCE IN FOREIGN MARKETS

**ENGLISH TRADE IS HARD HIT**

Queer impressions of the American cycle industry find lodgment in the nodules of the people who at this moment are busy in the endeavor to persuade the English trade that it is suffering more from overproduction than overcapitalization of manufacturing concerns. So bitter has been the disappointment of the past year that the Britons are ready to swallow any statement which is intended to distract their attention from the ruin that threatens. One of the American-hating trade papers spreads this surprising bit of information before its readers:

There was no promoting boom in the States and the majority of the factories were worked on very moderate capital. Still disaster came, and earlier than it came to England, and much direr. Scarcely half a dozen of the concerns have shown any kind of a return and the number of failures has been enormous. The tire trade is even worse, not a firm having come within many figures of the earnings of the leading English companies. We need scarcely point out that in America there are no monopolies, so to speak, and every gaspipe makes his hose-pipe tire as well—or as badly—as he likes.

Overproduction has been the bane and suicidal price-cutting has followed. Most of the companies had but small capital; hence few of them weathered the storm. America, with its smart business style, is not slow in seeking relief for the pressure and indefatigable efforts are being made to open up new markets. England, in a similar condition, is losing hold in the foreign markets and is beaten almost on her own ground.

The accompanying table shows how badly some of the English cycle making companies fared last year in comparison with 1897:

	Net profit. 1897.	Net profit. 1898.
Coventry Cross .....	\$ 58,765	\$ 9,190
Centaur .....	101,305	91,295
Humber .....	313,800	100,715
Premier .....	390,665	248,650
Singer .....	380,590	135,265
Swift .....	317,850	169,725
Triumph .....	114,040	70,300
Townsend .....	61,490	9,155
Progress .....	34,585	14,290
Raglan .....	173,430	77,605
Rudge-Whitworth .....	241,330	105,115
J. K. Starley .....	109,725	63,945
Riley .....	54,160	23,210

**MEXICAN TRADE CONDITIONS**

Though our bicycle trade with Mexico is not to be sneezed at, yet it will be some time before it grows to very large proportions.

The rich Mexicans are ready buyers of our goods.

Our exporters are not paying the same attention to the commercial customs of the republic that is given by manufacturers of other nations, principally England, France and Germany. The business conditions of Mexico are noteworthy, and it will be of much pecuniary benefit to our exporters to study them. In the first place, there are very few concerns doing business there that have not ample capital to carry out all contracts into which they may enter. Failures are very rare indeed, and when they do occur are carefully investigated by the authorities in the interests of creditors, and any attempts to defraud are severely punished. Book entries are regarded as sacred; all books kept by business houses are known and small stamp taxes paid on them, and thus a sort of surveillance is kept over them by government authorities. All this tends to keep up a high standard of commercial credit; and, now that the commercial agency of R. G. Dun & Co. has extended its operations to the republic, exact knowledge of the standing of the business houses may be obtained.

As the terms of American sellers are often very rigid, it is hard to reach an agreement, and much trade which by the

exercise of a little tact and judgment could be handled by American merchants goes elsewhere. For instance, terms usually offered by European merchants are four to six months' time, whereas American houses often require that the total amount of their invoices be placed in some bank in the United States, before the goods are shipped. Mexican buyers are desirous of dealing with the United States and would do so more extensively than at present, if trading facilities were offered them.

A few words as to the value of contracts in Mexico. Once an absolute understanding is had between buyer and seller, and the agreement reduced to writing, there is seldom any controversy, as a contract or a preliminary contract is regarded as binding, even though the only legal forms required in a preliminary contract are the affixing of a 50-cent stamp and the depositing of it with a notary public to be reduced to a public deed, when one of the interested parties requires it.

**THE KLONDIKE OF EUROPE**

Sweden has made more progress during the past two years than probably any other country in Europe. That great expanse of timber and iron land in the northern part of Sweden that formerly was the home of the Laplander and his reindeers is just being opened up to civilization. It has in times past been thought to be a worthless stretch of territory, but exploration has brought to light some of the finest mineral land in the world. Great things are in store for Sweden during the coming years, and her wants are to be many and varied. Our makers can find an outlet for almost any product that a new country is liable to require. It is a land that is going to be the Klondike of Europe.

A great mistake our exporters make is in not having the goods properly packed before shipping. Many articles, such as machinery and bicycles, fail to find a ready sale on account of their poor appearance on arrival. Many orders are placed from samples, and, to the disappointment of the buyer, the merchandise is frequently some grades below the sample which brought the order. A merchant who has been disappointed in this manner is loath to venture a second time.

Sweden has to a great extent been overlooked by our makers. In a great measure, the American goods are forwarded through German and English houses, thus making the importations expensive.

**OUR CYCLE TRADE IN ARGENTINA**

American bicycles dominate the Argentine market, and one make alone has a yearly sale amounting to about 2,000 machines. This trade has been gained by being content with small profits at first; indeed, it is not thought there was any profit at all on the early American business in the republic. American makers must remember that a good finish and nice appearance are absolutely indispensable—in many cases everything—even in the cheaper lines of goods, and it is in this direction that the largest demand arises. Too great care cannot be given on every and any detail which may be asked for, no matter how unimportant it may seem to the manufacturer. The Argentine Republic is one of the natural markets for United States exporters, and it will be their own fault if they let the trade slip away from them permanently.

**CHEAP BICYCLES IN ENGLAND**

English agents are regarding the manufacture of cheap bicycles with alarm. The makers, too, are nervous with apprehension. A little more than a year ago a prominent firm set the ball rolling in the direction of cheap prices, and as this particular firm reaped much advertisement from its action it was successful in obtaining an enormous amount of the patronage of buyers in 1898, with the result that at the end of the year a big profit had been made and the handsomest balance sheet of the season presented to gratified shareholders. The example set by the Rudge-Whitworth company has induced the majority of the leaders of the cycle industry to reduce their prices. Many have done it reluctantly, others with avidity. What the result will be the balance sheets of next year alone will tell. Anyway, it goes without saying that the move has been viewed with considerable alarm by a most important body of men—the British cycle agents.

The consensus of opinion seems to be that unless an enormous trade is done during 1899 the agents will suffer considerably, as the altered condition of things renders the profit on each bicycle so small as to scarcely pay depot expenses. Many agents, and prominent agents, too, announce that they will drop agencies for prominent makes, or even if they do not drop them will not stock considerably, but will push a local cheap bicycle made up of parts.

**BRIGHT PROSPECTS IN SOUTH AFRICA**

The outlook for trade in South Africa next year favors our manufacturers. The advantageous freight rates between New York and South African ports are to a great extent responsible for the growing trade anticipated. Though British manufacturers still lead in the South African trade, the persistent efforts which the Americans are making, combined with the favoritism shown for their wares, it is thought will do much towards securing a still larger share of the business. The British manufacturers have the advantage, however, in their credit system, which is in many ways similar to that employed at home. The eagerness of American manufacturers to transact business in South Africa for cash is a decided drawback. There is a credit system in South Africa which, when properly understood, leads experienced manufacturers to conclude that selling goods there is not attended with any greater risk than selling the home trade. In this particular branch of the business is where a well posted representative is most useful to the manufacturers.

Canada is coming to the front as an exporter to South Africa, not only through Dominion ports but direct from New York. The establishment in Cape Town of what is hoped to be a permanent exhibit of Canadian products shows how deep is the interest in that market. In this exhibition are found samples of Canadian bicycles.

**American Sundries in Demand.**

American handlebars, the neat and better class of American accessories, etc., are meeting with favorable recognition, and are being extensively copied in England. If the present rate of progress keeps up British dealers will soon use nothing but American wrenches, bells, lamps, oil cans, etc.

Barbadoes has roads of white coral.

## FAST FREIGHT SUITS DEALERS

### Retail Cycle Trade in Open Rebellion Against Extortionate Charges of Express Companies

There is no abatement in the interest being taken by dealers in the movement to compel the express companies to reduce their extortionate charges. Further contributions to the Cycle Age upon this highly important subject are herewith presented, and among them will be noticed a marked disinclination on the part of many firms favorably located for the substitution of fast freight for express, to swing their business away from the express companies:

#### Concerted Aggressive Movement Necessary.

Your recent article on "Exorbitant Express Rates" is of more than passing interest, now that the action of the express companies toward the war stamp has created such merited disfavor. Being closely affiliated with the Detroit Chamber of Commerce, the Manufacturers' Club and the Merchants' and Manufacturers' Exchange (organizations which to our best belief were among the first to complain against, and seek a cure for, the unpatriotic shift of these express companies), the writer is interested enough to say that we are not only uncompromisingly, but actively, in line with the advocates of fast freight and mail shipments.

Here in Detroit we took up the cudgel (not on the "friendly" plan either) in the Circuit Court and secured a decision from Judge Frazer against the companies. Copies of this decision, which was both logical and broad, have been circulated widely. Following this a memorial to Congress was prepared, urging the adoption of parcel post rates on, or similar to, the European basis. Copies of this memorial have been furnished to every congressman, senator and chamber of commerce in the United States, as well as to all the known commercial organizations in the country. There is no denying that an 11 or 12-pound parcel post would produce a salutary influence on these corporations, which impose extortionate rates so that they may pay dividends of 7 or 8 per cent on a fictitious capital, but which is really 70 or 80 per cent on the actual investment.

Our commercial clubs are invaluable and accomplish vast good. Those that are addicted to spasmodic, short-lived crusades are few indeed. Still, it is our belief that some concerted movement must be formulated and then pushed aggressively and everlastingly. In the meantime, in order to discourage these high-rate evils and the evasion of revenue on the part of the express companies, we are in favor of utilizing the fast freight lines and such other shipping facilities as may be at the hands of tradesmen.

Detroit, Mich. AMERICAN HARROW Co.

#### The Cost of Goods Increased.

We are heartily in sympathy with any movement to reduce the high rates charged by the express companies, which, for instance, is \$2.50 on a crated wheel from Chicago to this point, and other goods in proportion. We would use fast freight or any other way that would bring the goods in any reasonable time, but would like to call attention to the railroad rates on bicycles, which I understand are charged at three times the first class rate which almost brings the transportation cost up to the express rate. The last bicycle we had shipped from Chicago by freight cost \$1.67, which is almost as much as express charges, and if the railroads increase the rate for fast freight service would bring it up to that. We hope the movement will result in some good, as the transportation charges cut quite a figure in the cost of goods.

Cordele, Ga. CORDELE BICYCLE & MACH. WORKS.

#### Wants Government Ownership of Railroads.

We are in favor of any lowering of the exorbitant express and freight rates, but are more in favor of government ownership than any other way of reducing the express and freight charges.

In the issue of the Cycle Age of Dec. 22, you state the express companies are making from 150 to 175 per cent upon the capital invested. Now, if an express company can make that profit, why do the railway companies not turn all of their freight business into express, and cut off the express companies? Because the railway companies are

not starving upon a charge of \$6.20 per hundred upon crated bicycles from Chicago to Rock Springs, Wyo.

You also say that merchants are compelled to pay from five to 15 per cent of the value of goods for express charges. Why, we can cite you one case where a corporation was compelled to pay 160 per cent of the value of the goods bought for freight charges upon a whole carload; and we have paid as high as 100 per cent of the value of the goods, both by express and freight, and the most aggravating part of the affair is that we have no redress for such extortion in the courts.

Railway companies may extort what they please, and charge always "what the traffic will bear."

Rock Springs, Wyo.

W. W. PETERSON.

#### Absurd Variation in Charges.

You have struck a tender chord in my business experience. I am not at all pleased, nor have I ever been, with the express charges, as I have always considered them exorbitant; and not only that, but we cannot, or at least I cannot, get the same charges on the same article from the same place both going and coming. For instance, I sent a rear wheel, complete and crated, to Westfield, Mass., not long ago, and the charges were \$1.10; the same wheel came back in a few days crated in the same way, and nothing more nor less about the wheel or crate, and the charges were 90 cents. Now it seems to me that if it was worth a \$1.10 going, it ought to be worth \$1.10 coming, and if it was worth only 90 cents coming, the same amount ought to carry it. I would approve of fast freight instead of express if the roads would serve us promptly. I am very glad that you are agitating this question.

Columbia, S. C.

J. E. RICHARD.

#### Charges Vary Without Reason.

The proposal to use fast freight instead of express meets with our approval. Express charges are never twice the same. The express charges on one bicycle from Bay City was \$2.55. Freight on five others from Grand Rapids was 81 cents each. We can give better comparisons if desired.

Watertown, N. Y.

G. F. WILLIAMS.

#### Lower Rates Would Increase Shipments.

There is no doubt in our mind that the express charges are extortionate and out of proportion to the actual carrying expense. Almost every day we feel the need of rapid transit in the shipment of goods, and would have twenty times as many shipments come to us by express as we do now were it not that the excessive charges absolutely prohibit it. We certainly think the charges of these public carriers should be regulated by legislation; we see no other remedy. We would patronize fast freight, or anything else that would give us relief.

THE WHITE BICYCLE & SUNDRY Co.

New Orleans, La.

#### The Charges Are Outrageous.

We are quite in sympathy with the movement made against express charges. It is outrageous the charges we have to pay, especially when goods come through two companies.

Waterbury, Conn. THE CHARLES THATCHER Co.

#### Has Used Freight for Two Years.

The movement started against the express companies meets with my approval. It appears to me that something should be done, and I hope the efforts now being made will meet with success. Fast freight is what I want. In fact I have been using freight for about two years where 100 pounds to the shipment is made. However, there must be small packages, and here is where we suffer. The only specific complaint I know of is the refusal of the express companies to meet their part of the revenue stamp act. This item foots up no small amount to me. They should stand it.

Memphis, Tenn.

JEROME P. PARKER.

#### Rates Higher than Twenty Years Ago.

We think that the charges of express companies generally are exorbitant. Express rates are higher to-day than they were twenty years ago. The rates from Cincinnati, Ohio, and Louisville, Ky., were less

ten and twenty years ago than they are to-day, while freight rates are not more than half what they used to be. Why this state of affairs should continue to exist we confess we do not know, except that it seems that all express companies have agreed to get everything out of the business that it will stand. The railroad companies at one time had a reasonable rate on bicycles, but doubtless through the influence of the express companies who patronize their lines they doubled the rates. We would get all our bicycles except those we are in a particular hurry for by freight, if the railroads would class bicycles as they did four or five years ago

Owensboro, Ky.

W. A. GUENTHER & SONS.

#### Shippers Are to Blame.

If all bicycle, or other dealers, would guard against shipping goods by express, as I do, the express companies would either have to charge more for what they got, or charge much less in order to get more business. I am in favor of fast freight; it would no doubt enable us to get goods just as quickly as by express. As to making any complaint, I have none to make. If I should buy a horse, and was asked \$1,000 for him and paid it, I would have no one to blame but myself. The companies give shippers the price, they do the shipping, consequently the shipper is to blame. Let every dealer try to avoid them, and they will come down.

Sioux Falls, S. D.

ASA M'CARTY.

#### Compel Them to Abandon Robbery.

We are in favor of a fast freight and will use it so far as we possibly can. The smallness of the companies to compel the people to pay for the revenue stamp is about the last straw to break the camel's back. While but a small amount, it is unreasonable and unjust on their part, and some move should be taken to compel them to let up on the highway robbery which they are practicing on the people.

Sioux Falls, S. D.

MARKHAM & ROBINSON.

#### Reshipping Charges Heavy.

Since the crowding out of one express company here we have been entirely at the mercy of the other, which charges from 5 to 10 cents more on 25 cent packages wherever possible. All our express comes by one company to Springfield, and from there by another, and between the two they have raised the price from 25 to 40 cents more than it used to be. We are having all our sample wheels come in by freight and propose to use the freight shipping as much as possible during the coming season.

Meriden, Conn.

PROUDMAN BROS.

#### Approves of Fast Freight.

The proposal to use fast freight instead of express meets with my approval. The charges of four pound packages from Chicago to Yankton, S. D., are 55 cents.

Yankton, S. D.

GEORGE WAGNER.

#### In Favor of Fast Freight.

We heartily approve of the fast freight as a competitor against the express companies.

Seymour, Texas.

FINN, FOWLKES & Co.

#### Always Uses Fast Freight.

I am very much in sympathy with the movement started in New York. The use of fast freight does meet with my approval and I use it only. The express companies charge too much and their charges are not always the same on the same wheels.

Troy, N. Y.

E. H. BRUNELLE.

#### Has Begun Shipping by Fast Freight.

I think that the express charges are sometimes very high and would favor fast freight by all means. At any rate I have started to have all wheels shipped by freight. I hope that the present rate may be reduced in some way.

South Norwalk, Conn.

LUTHER M. WRIGHT.

#### Approves of Fast Freight.

The proposal to use fast freight meets my approval. The complaint I have is that the express rates are too high by 50 per cent. We would get everything by express if the rates were not so high.

Springfield, Mo.

J. E. ATKINSON.

#### Monopolistic Charges "Burn You Up."

There certainly should be some movement started and continued that will cause a reduction of the excessive express charges, especially at non-competitive points like this, where they charge what they please. Fast freight north and east means considerably different than it does in the south. It is the accepted opinion that express charges "burn you up" at this point, and I myself have paid in some instances 100 per cent. in charges compared to the value of

the goods when in small packages, thus barring the handling of any small matter of low valuation.

Pine Bluff, Ark. HARRY T. OLCOTT.

#### Overcharged on Weight.

We have complained for some time to the express companies direct. While their charges are high, we also find that their service is very poor, and goods are received in a damaged condition. We also find overcharge in weight of 4 per cent. for bicycles just received. Goods by freight are much cheaper.

Covington, Ky. J. H. MERSMAN & SON.

#### Order Early and Specify Fast Freight.

We are in favor of fast freight or any other transportation line that will lessen the outrageous charges of the express companies. Merchants should order early and ship by fast freight. If this takes place we will have the express companies soliciting our trade.

Camden, N. J. ROADSTER CYCLE HOUSE.

#### Cannot Understand Irregular Charges.

The proposal of using fast freight instead of express meets with our approval. Express charges are not always alike, and we do not know how they are made. About a year ago we received from Chicago one set of tires shipped us by express, which cost us 90 cents, and on the following day we got one dozen sets of tires from the same house which cost us just 70 cents.

Westernport, Md. C. A. PAGENHARDT & SON.

#### Southern Freight Too Slow.

Any steps taken to secure a low and at the same time reliable and rapid freight delivery will meet our approval and support. We are just at present having a rather severe lesson in fast freight delivery, which requires about seventeen days between Elyria, O., and New York city, and unless this time will be very much lowered by the proposed fast freight trains the express will get the balance of our business from that point. Our business relations from the express company at this point are all that we can ask, both as to rates and treatment, and individually we have no complaint to make of its services. Any movement tending to upset the pleasant relationship between the express company and ourselves will certainly be to our disadvantage.

Jacksonville, Fla. HARRIS BROS.

#### High Rates Protect Small Merchants.

I am not in favor of lower express charges, but heartily in favor of fast freight. My reason for high express rates is that they force thousands of country and village people to buy merchandise at home instead of sending orders to the big department and catalogue stores.

Paw Paw, Mich. H. C. WATERS.

#### Fast Freight as an Alternative.

I am emphatically in sympathy with the movement to compel express companies to moderate charges. If this cannot be accomplished I believe that the next best thing would be the use of fast freight.

Sturgis, S. D. GEO. B. BIESMANN.

#### Would Encourage Other Lines.

We are in sympathy with any movement that will help to lessen these charges, and will encourage any other route by our shipments if we can get any good service. We heartily indorse the movement to the fullest measure to down such corporations whose aim is to get all they can and pay less for labor than any other corporation.

Crisfield, Md. M. H. DOUGLAS & Co.

#### A Step in the Right Direction.

We are certainly in favor of compelling the express companies to moderate their charges, but do not think this can be done in a direct way. Using fast freight would be a step toward the point. We have no complaints to make of the express companies' services other than their robber charges.

Brookfield, Mo. E. L. CHAMBERLAIN & Co.

#### Declines to Pay Extortionate Charges.

I am in sympathy with the movement started in New York, and have been using fast freight instead of express for some time past and will continue to do so unless a change is made. I consider express charges extortionate to an extent that is simply robbery.

Columbus, Miss. J. C. BROYLES.

#### Seldom Uses Express.

I am not very much interested in the reduction of express charges. In a country town like this, department stores and city dealers sell more goods than I do, and all shipments by them are made by express,

while in many cases I can get my goods by freight and save the difference between freight and express rates. A reduction in express charges to me would mean a like reduction to any other person whether a dealer or not, and what advantage would that be to me? Of course there are times when I must patronize the express companies, but, under the circumstances, if the rates were cut in two it would do me no good. As it is now I am careful to buy my goods where transportation will not cost much. I am inclined to believe that manufacturers and dealers are fixing their prices, and getting stock in readiness in season, so that we may in most cases place our orders in time to have shipments made by freight. However I shall patronize freight lines whenever possible.

Central Lake, Mich. GEO. W. AUSTIN.

#### Freight All Right if Fast Enough.

We are in sympathy with the movement started in New York to compel the express companies to moderate their charges. Fast freight is all right if it is fast enough.

Quincy, Ill. PHELPS & BREMNER.

#### Pays Full Rates to Two Companies.

We are very much in sympathy with the movement started in New York to compel express companies to moderate their charges, and think the fast freight the very thing. Just the other day we lost 80 cents on a \$4 package shipped from Rochester, N. Y., after selling same at exactly list price. The U. S. Express Co. got full rates, so did Adams and Southern. We are compelled to pay two or three full rates on anything coming from any place beyond Washington, D. C.

Rock Hill, S. C. POA & WHITE.

#### Charges More than the Rate.

We have to pay from 15 to 20 cents per pound express from Chicago or New York, and while the express companies quote a rate much under that we have to pay it nearly every shipment. The average express on bicycles is about \$3 each, which is far too much for the weight. We will be glad to do all in our power to promote the movement now on foot, and believe it will result in considerable benefit to retail dealers.

Demorest, Ga. ADAMS & CASON.

#### Freight Shipments Need Care.

We are glad to note the interest the Cycle Age is taking in the movement to get the express companies to reduce their extortionate rates. We are certainly in sympathy with such a movement, as the rates are unreasonable. If the fast freight lines would use care with bicycles and bicycle sundries, there would be a good many more shipped that way. The trouble is that in loading bicycles they are so apt to be damaged unless properly loaded, and when shipped in mixed cars they are dumped in any way. That is the reason the express companies get so much of the shipping, even at their extortionate rates.

Kansas City, Mo. WILLIS ARMS & CYCLE Co.

#### For Fast Freight and Parcels Post.

I am entirely in favor of fast freight as against express, and would be willing at any time to give all the support I could to a movement for fast freight service and parcel mail delivery.

St. Johns, Mich. O. G. PLUNKETT.

#### Where Competition is Keen.

We have no just cause to complain of the treatment we have received at the hands of the express companies during the past year. Being favorably located, competition has been sufficiently sharp to keep rates to a nominal charge. Yet we know there are points which suffer from unjust discrimination, and are in sympathy with the move that is being taken in the interest of the retailers and hope that much good will come from the agitation. We appreciate fully the support that the Cycle Age is giving on the subject, and hope that it will aid in bringing about the desired end.

Dubuque, Iowa. VAN HORN & MILLER.

#### Takes the Profits to Pay Charges.

I am heartily in sympathy with the movement to compel the express companies to give us better rates; their methods are a sort of robbery. Often I get a package on which the charges are as much as two-thirds of the value of the goods. I have had bicycles come from New York the same day, weighing the same, one charged at 90 cents and the other at \$1.15 by the same express company. This charge is for one machine. I shall use fast freight this coming year, as it will save me a good sum. It will make only a few hours' difference. These exorbitant charges have been a hard yoke to bear, as the companies continually raise their rates, never lowering them. They

do not use their patrons as they should in trying to carry their goods as cheap as they can, but try to see how much they can get. I have wondered a good many times how long we would or could stand it in these days of small profits and lots of competition. It often takes the profit to pay the express charges on a package. I hope the business men will take hold and make them feel as though they must do us justice at least

Attica, N. Y. L. E. BATCHELDER.

#### Would Save by Using Freight.

I wish to express the deep sympathy I feel in the movement started against the express companies' extortionate charges, especially in the transportation of bicycles, and the firm stand your paper has taken in this direction. I have felt for some time that some effort should be made in this direction, as the carrying of bicycles is getting to be an immense business of itself. Although doing a limited business myself, I have felt like making a vigorous kick when paying the rates charged by the express companies for carrying my goods. Last year I had one wheel come by freight and the charge was 35 cents, while the express rate from the same point was \$1. If we could have a quick freight service we could save much by it. As the prices of wheels go down and the margins grow smaller it is very important to the retailer to save in transportation.

Westmoreland, N. Y. N. DE ROY LEE.

#### Freight Cheap and Satisfactory.

I am in sympathy with any movement to reduce rates, either express or freight. Most of my goods come by freight, as I keep a good supply on hand, and I find that it only takes one or two days longer by freight than by express. However, when I do get an express shipment the charges are enormous, in some cases exceeding the cost of the articles. The freight rate on bicycles, crated, to Wahpeton from Chicago is \$2.40 for 100 pounds. I think this is too high, but express is double the above.

Wahpeton, N. D. R. J. HUGHES, JR.

#### Favors Fast Freight.

I am heartily in sympathy with the movement and highly favor fast freight in place of express in many lines of goods.

Monticello, Minn. W. J. THOMPSON.

#### Offers Relief to the Dealer.

The proposal to use fast freight is all right. It would be far better than the express. The express charge is too much. I am paying \$3 on each bicycle that is received from New York. This is too much. Fast freight is what we want.

Biloxi, Miss. LOUIS MANGIN.

#### Using Freight Almost Entirely.

We heartily approve and indorse any means of transportation that can offer us fair service at reasonable rates. We certainly agree that the rates of the express companies are extortionate and very unsatisfactory to the retail trade, as it makes quite an inroad on the profits of the present day. We have, and we think most dealers have, complained many times of rates, but to no avail, and have therefore been having goods shipped almost entirely by freight, unless on hurry orders.

Wilmington, Del. PYLE CYCLE Co.

#### Sends Large Lots by Freight.

I think that shipping by fast freight will result in great saving not only to those in the cycle trade but the shippers in all lines of business. The difference in time won't amount to as much as the price by express. As for my business, I ship by express only small articles, say 25 cents or so; the large lots come and go by freight.

Atlantic City, N. J. CHARLES SINGER.

#### Believes in Fast Freight.

I am in sympathy with the movement to use fast freight instead of express.

South Lyon, Mich. JOHN CHALLIS.

#### Only One Railroad.

The proposal to use fast freight instead of express meets with my approval. The express charges are extortionate with but one railroad here.

Princeton, Ill. BANSCHBACH'S CYCLERY.

#### Wants Good Service at Lower Rates.

We think the express charges are entirely too high, and would be glad to use something that would give good service for less charge. We would be glad to give all the aid in this matter possible.

Cambridge, Md. CAMBRIDGE CYCLE Co.

#### Lower Rates or Fast Freight.

I am in favor of moderate express charges. If we cannot get them let us have fast freight instead.

Augusta, Ga. J. T. GRESHAM.

## SUBJECTS OF GENERAL INTEREST

**ENORMOUS VALUE OF PEAT FIBER** One of the most interesting and attractive exhibits at the Vienna exposition of last year was a building containing the most diverse articles made from peat. Everything in the building, from the carpets on the floor to the curtains at the windows and the paper on the wall, had been made from peat. These were but representatives of what will undoubtedly soon become a great industry and give to the peat bogs of the world a value never before dreamed of.

A study of peat shows that it is very largely made up of fibers. These fibers come from the remains of reeds and grasses, which, growing and dying in successive generations, form the peat. These fibers then are found to be very durable, very elastic, to be non-conductors of heat and non-combustible. If a fabric could be woven from them, it would be one possessing unique properties. To the toughness of linen it would add the warmth of wool, an absorbent power greater than that of cotton, and the indestructibility of asbestos. It must, however, be woven without the aid of oils or water, or much of its value would be lost.

After twelve years of experimenting, Herr Zschorner, of Vienna, succeeded in making the peat fibers weavable. There is now, therefore, scarcely any textile article which cannot be made from peat. Coats, hats, carpets, rugs, ropes, matting, and pillows are some of the articles which have been made, and have been found useful. What superiority these will prove to have in practice over fabrics made from other fibers, only time will tell. Some of them have, however, already been proved to be immensely superior to any other fabrics. This is especially true of the blankets and other coverings used for horses and cattle, for they greatly excel in warmth, absorbent power, cleanliness and durability. The unspun fiber possesses powerful antiseptic properties. The coarser fiber, it is expected, will come into favor for use in upholstery work, its extraordinary elasticity making it most valuable for this purpose.

The latest achievement of the discoverer of the uses of peat has been the making of paper from its fiber. This has been carried to such an extent that paper of almost every variety of weight and quality can be made, while the toughness and durability of each is equal to that of paper from any kind of vegetable pulp.

**TO RESTORE OUR MERCHANT NAVY** The new shipping bill, which was introduced in the Senate on December 19 probably represents the best effort that has been made thus far to frame the legislation necessary to create a great American merchant fleet, and to restore our supremacy in maritime commerce, which was lost by the United States half a century ago.

This bill as it stands is the product of the general effort of the various interests which are concerned in merchant shipping—the ship-owners, ship-builders, and the merchants and manufacturers upon whose trade the entire existence of ocean steamship lines depends. The two ends which this bill seeks to promote are the maintenance of a great fleet of merchant ships and the construction of a large amount of merchant tonnage in American yards. It is sought to accomplish these ends by providing for the payment of subsidies based upon tonnage and mileage, and the granting of American registry to

such vessels as are owned or contracted for by American capital; both of these privileges being conditioned upon the construction by the owners of a certain amount of new tonnage in American yards.

This plan possesses numerous advantages. It provides the necessary encouragement to the ship-owner by compensating him for those advantages which the owner of competing foreign vessels possesses, but which he does not enjoy. It provides business for American shipyards by compelling the construction of a large amount of entirely new tonnage. It gives to the shipper facilities for sending his goods abroad under the American flag at rates which it is fair to assume will compete with the rates offered by foreign tonnage. All of this is accomplished without imposing upon the importer or the exporter any restrictions which would hamper his business. The cost of accomplishing all these ends is to be defrayed from the general treasury and thus distributed widely and evenly over the whole country, just as the benefits of such a policy would be widely bestowed.

**FRUITFUL PARENT OF ALL TRUSTS** The fruitful parent of all the trusts that have been formed, and are now forming, is the Standard Oil Company. That is not only the oldest, but it is the strongest aggregation of capital and business capacity ever drawn together in any line of business outside of railroad operations. Its astonishing success fascinates the mind of every man who is familiar with commercial methods and who contemplates its attainments. Marvelous in the perfection of its organization, invincible in its strength, astonishing in its economies of production, and more astonishing in the low prices at which its products are marketed, it is the model from which every argument in support of the trust idea has been drawn. And so often and so furiously has it been attacked by press and pulpit, state legislatures and reformers of every kind and degree, that the American people have come to look upon it as a thing which must endure because of the essential soundness of the principles upon which it is builded. But the secrets of its strength are perfectly obvious to men who are trained in economic thought, says a writer in the India Rubber World.

In the first place, crude petroleum is a natural product. The supply is limited rigidly by the flow from known oil fields. The simple problem with which Rockefeller and his associates have to deal, therefore, is to get control in each new oil field as it develops. In other words, nature limits the supply of crude material, and geography definitely locates it. Having in the course of its operations secured absolute control of all existing oil fields, it is now a simple matter, with their enormous capital and obvious advantages, to speedily gain control of each new field as it is developed.

Beyond this, both crude and refined oil are large in bulk, and their transportation from the point of production to the point of manufacture, and then again to consumers in every part of the world, makes the item of transportation enormously important—so important that the Standard Oil Company has found it profitable to own thousands of tank cars and hundreds of miles of pipe line operated by gigantic pumping apparatus. Having command of this enormous amount of freight, they are in position to dictate terms which can either make or break railway lines, and

the sums they have thus saved on the cost of transportation mount into millions of dollars.

Beyond these two features of the business which broadly distinguish it from every other line of manufacture, enormous capital is required for the equipment of their factories, tens of thousands of employes are scattered all over the country, and the by products of their refineries are so many and so important that each in itself constitutes an important business. Indeed, it is said to be a fact that the profits from these by-products have come to be so great that the Standard Oil Company could afford to give away the ordinary grades of refined oil and still declare handsome dividends.

### BRITAIN'S COMMERCIAL DECLINE

It is to be doubted whether the British realize the extent to which their trade has fallen off. The explanation generally given for the decrease during the past year is that it has been caused by the great strike of the engineers, which ran through the latter half of 1897 and well into last year. Labor has during the past year been employed at increased wages over those paid previously, as a rule. But the productive capacity of the British mechanic no longer takes the lead. It is exceeded by that of the mechanic of the United States and of Germany. This is owing to three reasons: First, the British manufacturer does not avail himself of the latest improvements in machinery; second, the British mechanic is not now as technical as the American or German mechanic; third, the labor market is continually being disturbed by strikes and lockouts.

In spite of the above facts, there is a general confidence that the British foreign trade will revive. Manufacturers are becoming more enterprising in using up-to-date machinery coming from the United States. The engineers and their employers will probably not have another dispute for some time; the labor outlook, generally, is more pacific than for some time past; technical schools are being opened in most of the manufacturing towns; and in the commercial centers commercial schools have been opened to more especially meet German competition in foreign markets.

### GERMANY'S ONWARD MARCH

Constantinople is becoming as German as Berlin. While England and Russia have been disputing about the shell, Germany has carried off the oyster. They are steadily pushing on their railroad through Asia Minor. Every station is a little German colony. Every depot is a German bazaar. Before we know where we are Asiatic Turkey will have become a German province. So far as England, Russia and France are concerned, they have no ground for complaint. They have one and all failed to protect the populations of Asia Minor, and have thereby abdicated their right to object when another power undertakes to make the desert bloom as the rose. Of course it is very iniquitous that it should be done in alliance with the Turk. But there will be short shrift for the sultan as soon as the German really feels his feet in Asia Minor.

The French Budget Commission has voted a credit of \$8,000 for the purchase of folding bicycles for the army during the present year.

## RECENT PATENTS

## American Tubeless Detachable Tire—Two-Piece Pressed Crown—Combination Handle Bar

**Single Tube Clincher Tire.**—The invention comprises what is probably the first of its kind in this country, though similar tires have been made, and are now in quite extensive use in England. The tire is made with a base which fits a rim similar to that of the G. & J. tire, but with

the lapping edges so formed as to receive between them an annular sealing tube. The inflation valve leads to the expansible sealing tube, all the air which is forced into the tire first passing through that tube and thence into the tire proper through small holes arranged along the top side of the tube near the joining edges of the tire. The claim made for the sealing tube is that after the tire has been inflated the pressure of the tube against the adjacent edges of the tire base will tend to make the joint more surely air tight than would otherwise be possible. The inventor is W. F. Cornelius of Indianapolis.

**Sheet Metal Fork Crown.**—The crown is composed of two pieces of taper gauge tubing, whether it is made separate from the fork blades or has them as integral extensions. The tubing is of oval section and before the sections are bent into arch shape the inner end of each is flashed to form a semi-cylindrical collar. After the two sections are united a complete flanged collar for the reception of the fork stem tube is obtained. The collar is formed only at the top side of the crown, the lower walls of the sections being merely scarfed off to form a hole to take the lower end of the stem. The two sections after being formed are electrically welded together and the piece thus made

is bent into arch shape, this operation completing the crown. If the tube pieces from which the crown is made are not extended to include the fork sides their lower outer ends are swaged to reduce their diameters sufficiently to receive the

fork blades in a flush joint fashion. One care to be observed in flashing the ends which join and form the central collar of the crown is to so work the metal that the thickness of the two adjoining walls will be the same, for in the electrical welding process if the two walls to be butt jointed are not of even thickness the thinner one will be burned out in the process. The inventor is C. H. Smith, Chicago, assignor to the Geo. L. Thompson Mfg. Co., same place.

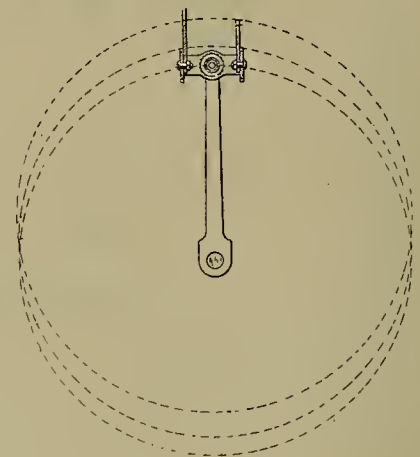

**Combined Bar, Brake and Bell.**—The head or T piece of the handle bar stem is notched around one end and receives in any two diametrically opposite notches a square rod extending through the handle bar tube and slidably engaging slots cut in the tube. The movement of the rod is restrained by a coil spring placed between it and a small pin crossing the bar tube. A collar holding the protruding ends of the sliding bar serves as a hand piece for releasing it when the rider desires to adjust the bars. The movement of the bar

in the head piece is limited in the opposite direction by a pin-secured collar. The stem directly under the head piece is externally threaded and carries a nut for the operation of the tightening device which comprises a hollow taper plug hung by means of slots in its walls from a transverse pin resting in the internal annular groove cut in the locking nut. The taper plug tends to expand the split lower end of the handle bar stem against the wall of the fork stem tube. The various cross pins needed in these devices also serve as guides for the chains or cords which run down through the stem to operate the brake and bell. The latter may be of any desired type, while the former is preferably made similar to one previously patented by the same inventor. The cords run to cross pins placed in slots near the handle bar grips, and are provided with button heads to be used as hand pieces. Inside of the handle bar at the grip end, to which runs the brake operating cord, is hung in a slidable manner, a rod having on its inner end a forked locking arm with reversed lugs. The other end of the rod is squared to match a squared hole in a button placed in the ferrule of the grip. By pushing this button with the thumb and turning it so that the reversed lugs of the fork are made to catch the transverse brake operating bar, the spring acting against the button will cause the brake to be locked

until the rider shall see fit to release it by disengaging the locking jaw from the operating bar. This locking device is for the purpose of making it impossible for anyone who does not know how to release the brake to ride away on the bicycle while the owner is absent. The inventor is M. L. Nichols, Westfield, N. J., assignor to the Evolution Cycle Co., Washington, D. C.

**Pedal Attachment.**—Removable sideplates are attached to ordinary pedals, the plates being toothed the same as the regular sideplates and of such height that the foot surface will be brought some

distance above the usual position. In riding under ordinary circumstances the rider places his feet on the sides of the pedals to which the extension plates are not attached. When it is desired to vary the length of the stroke, as for climbing hills, the rider by a foot movement similar to that which cyclists are accustomed to use in catching toe clips, rotates the pedals and catches the sides which are fitted with the extension plates. This change of foot position is supposed to give a longer leverage to the upper part of the down stroke. The inventor is Albert Wagner, of Chicago.

## PUNCTURE PROOF TIRE FILLING

German Inventor Produces a Light, Spongy, Elastic Substance from Gelatin or Glue—His Process.

Patent has been granted to Julius Deborde of Berlin, Germany, on an elastic filling for tires, saddles and similar cushioned articles, and on the process of manufacture thereof.

The inventor makes a jelly of glue or gelatin to which is added glycerin to prevent hardening, and an antiseptic substance to prevent fermentation, and heats the mixture until it becomes liquefied, when he beats it into a foam by suitable mechanical means, and, introducing it in this state into the tire or saddle, allows it to cool and solidify, retaining the air in the bubbles by which the elasticity of the substance, itself elastic, is considerably increased, and the weight much reduced. The result is a spongy substance of cellular formation. The weight may be further decreased and the substance made more elastic by the introduction of a number of small hollow balls or tubes of soft rubber.

Instead of forcing the substance directly into tires when in the heated plastic state, it may be run into molds of the desired shape and allowed to cool first. Cushions of this material are durable, do not become rigid, non-elastic nor hardened, and can be made economically. They are also good conductors of heat and consequently cool in use.

The inventor has secured patents in Germany, Sweden, France, Belgium, England, Austria, Hungary, Norway, Switzerland, Italy, Luxemburg and Spain.

# Your Half?

Well begun is half done.

**T**HE STEARNS is a long established wheel. It is a largely advertised and therefore widely known wheel.

The Stearns is a prosperous wheel. The factories have been running continuously throughout the past summer and fall. The 1899 models have been greatly improved.

This is, in brief, our half.  
What about your half?

To make your agency a leading agency you should have a leader. The Stearns is known and is popular in every country on the globe. The color individualizes it as no other wheel has ever been individualized. The 1899 designs are new and fascinating.

The agency costs nothing. The terms are advantageous. The treatment is liberal. The prestige gained immediately stamps you as a leading dealer.

If you are progressive, our good will, purchased without price, may be easily worth thousands of dollars to you. There is no honest competition that will stand Stearns' competition.

Indications point to a brisk bicycle business this season. Are you going to remain at a standstill or secure your share of it? How about your half?

The Yellow Fellow Year Book, now ready, explains improvements, gives variety of wheels and prices. We invite correspondence. ❁❁❁❁

## HERTEL GASOLINE CARRIAGES

**Light, Inexpensive Vehicles Controlled by a Single Lever**  
—Prepared to Fill Orders

Many articles have been published during the past year upon the practicability of road wagons or carriages driven by motor power and it would seem that the solution of this question is rapidly approaching. In large cities in this country a few vehicles are encountered driven by motor power, but this country is several years behind Europe in the manufacture and use of motor vehicles.

France has paid more attention than any other country to motor vehicles. Motor carriage races were popular in France nearly a decade ago, but, as was the case with the bicycle, it has taken the United States some time to "catch on" to the motor vehicle idea. Now, however, many firms are experimenting and some of them are actually building commercial

The rapid improvement in roads and their construction will operate much in favor of the horseless carriage, but it is expected that there will be in many parts of this country obstacles to the introduction of the motor vehicle in the way of impassable roads which can only be traversed by the horse.

### The Hertel Carriage.

The Oakman Motor Vehicle Company, whose factories are at Greenfield, Mass., has just lately brought out the Hertel carriage and rapid package delivery wagon. This carriage has been brought to its present state through work extending over the past six years, and is apparently one of the simplest and lightest vehicles yet produced. It is driven by ordinary

motor vehicles of different types, ranging from a parcel carrier to the elaborate brougham costing \$3,000 or more.

### Gasoline Delivery Wagons in Paris.

Experts differ as to the best motive power, but at present the gasoline driven vehicle is much favored from a practical standpoint. Paris has adopted this machine and it is a common sight on the streets to see the hydrocarbon delivery wagon or carriage passing, many of the large stores using them exclusively.

The price at present on motor carriages driven by gas is much less than it is for electrical machines. Experts believe that before the century closes a good practical gasoline carriage will be sold for \$500 or less. This it is confidently believed, will bring them into common use.

### American Vehicles Going to Europe.

The manufacture of American motor vehicles will undoubtedly, as was the case with the bicycle, surpass European production, and the American article is already going abroad. The motor carriage will always be ready for use; is more economical than maintaining teams, and there is hardly a doubt that it will become the favorite means of locomotion before another decade has passed.

gasoline, is odorless, and can be run fifty miles at a cost of about five cents. Explosion is utterly impossible.

The carriage for two people weighs about 450 to 475 pounds, which compared with other vehicles, is very light. It is very simple and easily controlled. It is started with a lever held in the left hand, which not only starts the machine, but regulates the speed and sets the brake. The vehicle is steered by a lever in the right hand and is very easily managed. A novice can operate it in a short time. It is very simple in construction, having fewer pieces than other machines to get out of order. It can be geared to any rate of speed and yet be entirely under control of the operator. The economy of running, ease of operation and its light weight seem to make it a leader among practical road machines.

### Fuel For Seventy-Five Miles.

The accompanying cut shows the vehicle for two people. It is not affected by heat or cold, requires no cooling and no change of water, as is often the case with hydrocarbon machines. The tank when filled with fuel will furnish power for a continuous trip of seventy-five miles, but ordinarily should be replenished at the end of fifty miles.

R. N. Oakman, at Greenfield, Mass., is president of the company, and G. G. Brandenburg, of the Iven-Brandenburg Company, Chicago, is vice-president, and all western business will be looked after by him. J. I. Brandenburg, New York, will handle the business in the east.

The company is ready to deliver vehicles at once, and is prepared to turn out any quantity that may be required.

### To Build Motors for Vehicles.

The Denison Motor Wagon company has been incorporated under the laws of New Jersey to manufacture petroleum engines for use on tricycles, carriers, carriages, drays and motor vehicles under the Denison patents, which the new company controls. The engines are an adaptation of the Denison marine engines to the requirements of motor vehicles, the problem having been carefully studied out during the past three years by E. F. Walton and Ernest Merrick, with a view to producing an engine of excellent running qualities, great freedom from vibration, noise and odor, and easy to control. The engines will be made in various sizes from one-horse power up and will be offered to the public on all forms of vehicles. They will also be sold separately to the trade for use by those who wish to make their own vehicles and attachments. The factory of the company is in New Haven and the general offices are located for the present at 308 West Fifty-ninth street, New York. The officers are Ernest F. Walton, president; Ernest Merrick, vice-president; George L. Record, secretary and treasurer, and Julian F. Denison, engineer. The directorate includes the same men and also Julian B. Tinkham.

### Another Steam Wagon.

Springfield, Mass., Jan. 9.—J. H. Bullard, of this city, a well-known inventor, has about perfected a steam wagon for which lightness, simplicity of construction and low cost of operation are claimed. Mr. Bullard has been at work on the wagon for twelve years and during the past week has given the carriage several trials. The maximum weight of the vehicle will not exceed 500 pounds, and it can be speeded as slow as one ordinarily walks, or at the rate of twenty-five miles an hour. The power is furnished by a pair of vertical engines. The boilers hold about four gallons of water, or sufficient to run the wagon fifty miles. Either naphtha or other volatile oils can be used for fuel. The cost of operation is about one-third of a cent a mile. The boilers are equal to a pressure of 700 pounds, while the working pressure is but 160 pounds. There is no danger, it is claimed, should the water become exhausted in the boilers. The power is transmitted by a chain and sprocket. The wheels are of bicycle pattern, with ball bearings. In appearance the wagon is decidedly neat, all of the mechanism being concealed, and the lines of the body following closely those of the up-to-date pleasure vehicle.

### Motor Vehicle Speed Contest in Paris.

The first regular tournament of short distance races for automobiles was held in Paris on Sunday, December 18. There were twenty-one competing vehicles, of which fourteen were passenger wagons and carriages, six were tricycles, and one was a bicycle. Only one of the heavy vehicles was propelled by electricity, the others employing petroleum as a motive force. Two trials at one kilometer were given each machine, the first with standing start and the second with flying start, the sum of the two times determining the positions of the competitors in the contest. The electric vehicle, owned by Count Chassaloup-Loubat, made very much the

best time in both heats, the total time for the two being twenty seconds less than that of the closest competitor, which was a petroleum vehicle. The first kilometer was covered in 1:12 3-5, and the second in :57. The third best time was made by a tricycle. The motor bicycle was awarded sixteenth place. The tricycles made a better average showing than the heavy petroleum vehicles, the five slowest times being made by the latter class. The slowest time for the standing start was 2:58, and for the flying start, 2:52 2-5.

### AUTOMOBILE TRADE IN FRANCE

Makers of Cycle Parts Deeply Interested—Complete Sets of Parts for Motor Tricycles.

Nearly all French cycle manufacturers are making motor cycles, or motor carriages, or both. Their cycle trade is still large, but prices, ruling as they do from \$40 to \$75, are not remunerative. The demand for cycles is now easily met; the demand for motors is yet unfathomed. People load makers of well-known motors with their money in prepayment—premiums are offered to induce quick delivery. Bicycles sell and will continue to sell; but anybody who can afford and obtain a motor cycle or motorcar will not mount a bicycle. They laugh in Paris as they compare the exhilaration of le sport automobile with the less exciting pedaling of a bicycle.

Automobiles were so numerous at the recent Paris show that at least one-half of the space was devoted to them. In another year it would not be surprising if the title of the exhibition were reversed, and the cycle given second place. Every parts maker, tube maker, tire maker—everyone hitherto associated with the cycle trade as a maker of components or accessories—is now equally setting out to supply motor parts and fittings. Complete sets for motor tricycles may be purchased, leaving the purchaser to build up the frame and wheels and bolt together the motor parts.

An idea prevails that the motor tricycle, so popular in France, will have to give place to a neat little car for two or three persons.

Most of the fashionable cycling clubs in London have died from lack of support.

There are enough tandems stocked in England to make it unnecessary to build any for the coming season.

### That Big Deal in Automobiles.

Motor vehicle builders are skeptical about the truth of the published reports of the gigantic deal alleged to have been put through by the Fisher Equipment company and the Count de Jotemps, by which the latter is said to have contracted for the annual delivery of the company's machines for a period of ten years at a price of \$5,000,000. And in truth the story does sound strange in view of the fact that the contract implies a fixed form of manufacture for so long a period and presupposes that existing prices will remain constant. Colonel Pope has declared his belief that nobody in this age of rapid and revolutionizing invention, and in the very infancy of this business, is making contracts for delivery ten years ahead. It is quite likely that the press story is somewhat exaggerated in this respect; but it is certain that the Count is placing some big orders for these vehicles and it is natural that the contracts should make some sort of provision for the future.

Electric ignition in small explosion motors seems to be gaining in favor in England, where the partial failure of this method of firing was due formerly to the use of too small a plug and to wiring too highly.

## ONE HUNDRED STEAM WAGONS

### TEST FOR LIGHT CONSTRUCTION

Steam Vehicles Weighing Less than Four Hundred Pounds to be Tried on Large Scale.

The Stanley brothers, of Newton, Mass., have decided on their commercial model, and write that they have begun making their first lot of 100 wagons. They have made changes in the frame so as to use full elliptic springs instead of the half-elliptics; the new model will be about 40 pounds lighter than their first wagon, which weighed, empty, 410 pounds.

This new model wagon has a backing action, the engines being fitted with the link valve motion.

William B. Mason, of Milton, Mass., will supply the engines, and this insures excellent workmanship on the Stanley motors. Mason is past master of the art of using automatic and semi-automatic machine tools, and the Stanley motors will be perfectly interchangeable in all their parts, so that repairs can be supplied at low rates, when needed.

The cardinal feature of interest in this matter of a hundred new Stanley wagons is the weight of these vehicles. Without exception, all of the other and more experienced motorcycle makers assert that no mechanically driven wagon weighing under six or eight hundred pounds empty, will stay together on the road.

If Stanley builds and sells a hundred wagons weighing under 400 pounds each, the behavior of these vehicles on the road will settle the question of motorcycle weight possibilities, as no experiment on a small scale could settle it.

#### The Distribution of Weights.

The Stanleys have operated their 410 pound wagon for more than a year, and most of their running has been done with two passengers up; this would give the Stanley total weight on the road well towards 900 pounds, made up about as follows: Twelve gallons of water in the water tank and the water in the boiler, say 150 pounds of water; 30 pounds of gasoline; two passengers, 300 pounds; these items make up a total of 890 pounds. The Stanley boiler weighs 95 pounds, and the engines, with the link valve motion will probably weigh about 25 pounds. This makes about 140 pounds for all of the Stanley machinery, allowing 20 pounds for the chain and compensating gear and brake. This leaves 270 pounds for the weight of the running gear and the very light body and springs of the Stanley wagon, which is framed with steel tubing, bicycle frame construction, and has very light wheels, only 28 inches in diameter.

Here, then, we have a 270 pound wagon, running gear and body only, carrying a load of machinery and supplies and passengers of about 620 pounds.

#### Organize to Protect Owners.

The California Bicyclists' Protective Association has been incorporated in Los Angeles with a capital stock of \$10,000 to deal in bicycles, motor cycles and their attachments, to protect the owners from loss by theft, to prosecute persons charged with theft, and to hold real estate. The directors named are A. C. Harper, M. M. Griggs, C. J. George, M. N. George and H. C. Brown.

#### Motor Vehicle Service Recommended

The state council of the grand duchy of Luxemburg has recommended a project for the establishment of a public passenger and merchandise service by motor vehicles in Germany, and has sent a letter to this effect to the grand duke for his

approval. It is pointed out that in many parts of the country it is impossible to build even single track railroads, and that motor vehicles, which have proved themselves very efficient, would be convenient. The heavy weight class of vehicle capable of an average speed of twelve to fifteen kilometers an hour is preferred.

### PENNINGTON'S BUCK-BOARD

Nearly Four Hundred of them Claimed to Have Been Sold—A Horizontal Fly Wheel.

Pennington and Baines, 5 Great Winchester St., London, E. C., have out a new 4-wheeled wagon.

This vehicle is said to weigh a little more than 225 lbs. It carries two passengers on the front seat, and a third passenger can ride on a single rear seat. The price is 95 guineas, or about \$475. The body of the wagon is said to be built of "strong sheet tubing," whatever that contradictory term may mean, and the vehicle is said to be "elegant, comfortable, speedy and noiseless," and to produce "no odor." Pennington and Baines also assert that 397 of these wagons have been sold.

No detailed description of the machinery is given, more than that the explosion motors, electric ignition, have water jacketed cylinders and drive a heavy fly-wheel revolving in a horizontal plane, instead of in a vertical plane as is usual, and having a rope drive from V-grooved wooden pulleys, the rope passing over a flat-faced pulley formed on the compensating gear disk. The passengers are carried very low, and are wholly unprotected from the weather.

The buck-board platform carries all the machinery underneath, and unprotected from dust. The front wheels are driven, and the rear wheels are used to steer with.

The driving rope is made endless with a long splicing, and costs only about 65 cents. Of course this rope drive demands some sort of a "take-up," and this detail is in the form of a pivoted spring controlled lever, carrying an idle pulley over which the driving rope passes, so as to give a constant tension thereto. This tension may be increased by foot pressure if the driving rope shows signs of slipping.

This construction brings the machinery close to the road surface, but it has an inch more clearance, it is said, than the De Dion Four-wheeler has. The cylinder appears to be single; it is spoken of as having a long stroke.

The water and the gasoline are said to be carried in cylinders set across the front of the up-curving dash board, much like the arrangement used in Pennington's first vehicles.

The carriage is said to be fitted with "compound springs," in addition to the springs afforded by the pneumatic tires. The "compound springs" appear to be vertical coiled springs, placed under the front seat. The rear seat, which appears to be a cycle saddle, hardly to be classed as luxurious for a long ride, is also supplied with independent springs.

This new vehicle of Pennington's is of interest because of its light weight, and because of the rope drive. It is of more interest commercially than mechanically, however, because 397 of these small, cheap, and by no means elegant wagons have been sold within a very short time, if the printed statements of Pennington and Baines are to be believed.

The first motor omnibus service in England was established December 21 between Kew Bridge and Hounslow by way of Brentford and Isleworth.

The German imports and exports of bicycles are now almost equal in figures.

Fork No. 22. Stay No. 22½.

Seven-Eighths Inch "D" Rear Fork, for 28-inch and 30-inch Wheels.

Length for 28 inch wheel, 3⅜ inches from hanger to bend, 14⅝ inches from bend to rear end, 18 inches over all.

Length for 30-inch wheel, 4½ inches from hanger to bend, 15¾ inches from bend to rear end, 20¼ inches over all.

# INFORMATION FOR BUYERS

## APPRECIATIVE OF DEALERS' INTERESTS.

Dealers are always glad to do business with bicycle makers who are at pains to study their interests, and save them money in conducting negotiations. The National Cycle Mfg. Co., of Bay City, Mich., has perceived the value of this, and in its catalogue furnished a cipher telegraphic code which, in addition to offering a convenience in placing hurried order, avoids the danger of misinterpretation. In this catalogue the company takes occasion to remark:

"Simplicity is the keystone of successful and satisfactory bicycle construction. An improvement which does not make it easier for the rider to take care of his bicycle, which demands the services of an experienced mechanic, or which, while novel, is inclined to be troublesome just when the use of the machine is a necessary part of its owner's pleasure, is not an improvement. Working upon this theory, we have avoided all complex construction, devoting ourselves steadfastly to the simplification of our improvements and developing new ideas which would increase the pleasure of the rider. We have always felt that the rider should not be bothered by numerous tools. Specialties in the line of tools are as much of a nuisance to the rider as complex construction, for when they are most needed they cannot be found. A kit of tools is not a necessary part of National equipment. Put a modicum of common sense behind the use of a monkey-wrench, and you are equipped to take care of a National and all its parts, using it with pleasure, without repair bills, and getting the highest value out of the money you have invested."

## THE MOFFAT CHIMES.

The operation of this bicycle alarm is so plainly shown by the drawing that no other explanation is necessary than to state that a pull on the cord acting through the lever pivoted on the bracket attached to the fork-sides depresses the small pulley into contact with the rubber tire of the front wheel. In revolving this pulley causes the small metal rings attached to its axle to strike the gongs alternately, and as these gongs are selected in pairs of different tones they give forth a mellow musical sound that is at once pleasant and loud. The action is simple, positive, and always in order. The whole device has been improved by doing away with the unsightly clamp on the handle-bar and fastening the cord with a patent holdfast tie, making the adjustment of the cord easy, the pull direct, and allowing the use of a heavier

spring to keep the pulley normally off the tire. The gongs are also being fastened on with larger screws. T. B. Moffat, patentee and sole manufacturer, has increased the capacity of his plant at 132 South Main street, Pittsburg, Pa., and by buying material in larger quantities has felt it consistent to make a reduction in the price of the chimes. Besides manufacturing these chimes, Moffat also makes bicycles and other specialties and acts as jobber of standard parts, fittings and sundries.

## THE LONG BEAM GAS LAMP.

Unusually strong claims of perfection are made by the Long Beam Lamp Co. of Hillsboro, O., for its Long Beam acetylene lamp here shown in cross section. One of the principal constructional features to which special attention is called is the novel de-

parture of placing the water reservoir at the extreme base of the lamp, with the carbide chamber between it and the superposed reflector, which, being of the parabolic type, also serves the purpose of a combustion chamber. The water is fed to the carbide by capillary attraction through the wick filling the central tube and consequently the flow must be even and the gas generated in constant volume with the result that the flame is steady and of the same height whether the rider is traveling over smooth or rough roads. Water from the reservoir is admitted to this wick through the valve opened and closed by the thumb screw shown at the bottom. The upper part of the lamp, comprising the cover to the gas chamber, the burner, reflector and bracket, unscrews from the lower part, leaving the cylindrical portion open for the reception of the carbide. This having been introduced,

the metal diaphragm carrying the coil spring is placed over it to prevent it shaking about. The reflector is of the parabolic form, most carefully constructed upon scientific principles, with means for adjusting so that the flame can be brought to the exact focal point of the reflector. This reflector is heavily silver plated and the combustion of the gas is so perfect, it is claimed, that the reflector will not tarnish and with ordinary care will last for years. The greatest volume of light is projected straight ahead for a long distance in a narrow angle, whence the name "Long Beam," but an auxiliary oval of light is thrown downward upon the road immediately in advance of the front wheel for 75 feet and diffused light is thrown outward upon either side, illuminating objects that are passed. In attaching to the machine, the lamp body is set perfectly level and the desired angle of illumination secured by raising or lowering the reflector on the burner tube by means of the thumb lever shown. Concentration or diffusion of the rays can be regulated by front and back adjustment of the reflector in the top of the standard. The lamp will burn five hours with one charge of carbide. By photometric tests it is shown that the beam of light thrown is of 480 candle power strength, while the reflector has a magnifying power of fifty times. While expense has not been spared to make this a perfect lamp, it is being offered at a popular price.

## "ACETALITE" AND CARBIDE TANKS.

The difficulty heretofore experienced in handling carbide of calcium for bicycle lamps has been overcome by the two new specialties introduced by the Cycle Syndicate, 320 Broadway, N. Y.

Calcium carbide, as sold to dealers, has an extremely disagreeable and lasting smell. By a special process of deodorizing this company has succeeded in making it a sundry which is not in the least objectionable. It has given this the name of "Acetalite." Another important property of this compound is that it is anhydrous, which warrants its extensive use, as the successful generation of acetylene gas largely depends upon the affinity of the carbide for water. The carbide storage tank, made in compliance with the regulations of the fire departments of the principal cities, is an

indispensable article for the progressive dealer. Unless carbide is kept in a strictly water and fire proof tank or vault, six inches above the ground, dealers are not only prohibited from carrying it in stock, but the board of fire underwriters cancels their insurance policies. The tank is made of two heavy, low carbon, boiler steel cylinders, between which is a fireproof packing magnesia asbestos. The tank is capable of withstanding a strain of 500 pounds per square inch. It will hold from fifty to seventy-five pounds of "Acetalite" as packed in cans containing 1, 2 and 5 pounds or it will hold 100 pounds of the loose carbide.

For the purpose of introducing these two articles the Cycle Syndicate is making a combination offer of the tank and 50 pounds of "Acetalite" in assorted cans at a specially reduced price when cash accompanies order.

## PREVENTS RUSTING UNDER ENAMEL.

The anti-rust enamel, made by the American Enamel Co., of Providence, R. I., has been severely tested, and is now pronounced thoroughly satisfactory. It is applied as a foundation, or first coating, on the bicycle frames before applying the regular enamels. There is, as all bicycle manufacturers to their sorrow know, a great deal of trouble arising from the rusting of the tubes underneath the enamel, and the blame for this has been ascribed to the enamel, but really the enamel has no more to do with it than the rise or fall of the tides. It is due to the acid treatment of the tubing at the factories, which acid enters the pores, and is not neutralized or washed off. It gives trouble underneath the enamel in a great many instances. The use of boracic acid in brazing furnishes another cause for rusting underneath the enamel on tubing. In order to counteract this many bicycle manufacturers now are coppering frames by battery process. The bicycle manufacturers throughout the country have from time to time written the American Enamel Co., and have really looked to it to make some kind of enamel or coating for a foundation, which will remedy this trouble, and material has been produced which serves its purpose admirably, as is evidenced by the orders received for it. It is what might be called a hold-fast and a specific, almost, easily and quickly applied at a small expense.

## COMPLETE TUBE CATALOGUE.

The Shelby Steel Tube Co., of Cleveland deserves to be complimented upon the thoroughness which it has displayed in com-

pling its recently issued catalogue. The work is a 74-page booklet printed on fine enameled paper, and illustrates, describes and gives prices on its tubing and tubing specialties in a more complete manner than is customary in catalogues of such material. In the first part of the catalogue are illustrations and general descriptions of the line of front fork sides, rear fork and stay tubes, curved drop frame tubes, etc., manufactured, and following these are line drawings marked with all possible measurements in such a manner that any purchaser by careful reference to these pages can determine for himself whether the Shelby Company has among its staple stock what he wants, and may also learn just what the exact proportions, measurements and appearance of the material are. The different combinations of round, D, oval, straight, bent, tapered, and other rear forks and stays form a very elaborate set of

# Barnes Bicycles

The most complete line ever offered.

Many agents having heard of the new line for 1899 are ordering sample wheels; the invariable result is that they obtain the agency as quickly as they can.

Equal style and equal quality have never been combined before in any bicycle.

Let us hear from you if you want a line that will do its own talking.

MARCH-DAVIS CYCLE MFG. CO.

FACTORY: MFRS.  
44th and North Aves. 47 Warren Street,  
CHICAGO NEW YORK

Careful observation of the wants of the trade—coupled with strict economy in production, enables us to offer the dealer at popular prices, a line of goods of unexcelled quality. Such are Snell Bicycles. If you do not believe it, investigate and be convinced.

Write for  
Catalogue....

THE SNELL CYCLE FITTINGS CO., Toledo, Ohio, U. S. A.

such parts from which one would have to be very particular if he could not select what he desired. The various lengths, diameters, gauge, etc., of front fork stems in straight and tapered gauge tubing are also shown in diagrams. Handle bar tubes and frame tubes cut to length are treated likewise. Another valuable and novel feature of the catalogue is the code list for ordering tubing by telegraph. One code gives the terms for expressing prices of tubing, another gives the terms for pieces and pairs of specialties, while a third comprises a complete code for denoting feet and inches. One of the specialties made from tubing by this company, and included in the catalogue, is the arch crown here illustrated. It is to be used with continuous forks, and is made in two patterns, one for front forks and one for rear forks and stays in three-crown frames. The Shelby Company has also issued a small price list of such sizes and shapes of steel tubing as are used for mechanical and engineering purposes. It is compact, the prices and measurements being arranged in tabular form.

#### CROSBY & MAYER CO.'S FITTINGS.

A complete catalogue has been issued by the Crosby & Mayer Co., Buffalo, and is being mailed to the trade as representing the company's line of home manufactured sheet steel goods and the various other fittings for which the firm is manufacturers' agent. The sheet steel line comprises frame sets and parts of many styles, and stamped cups, cones, etc., as well as frame fittings, such as small chain adjusters, handle bar clamps, washers, ferrules and dress guard clips and braces. One of the specialties is the seat post cluster illustrated herewith, designed for flush joint construction, and of a present popular style in which the rear stays run close together and parallel down to the point of separation directly above the rear wheel.

Goods for which the company is manufacturers' selling agent, include the spokes

THE CYCLE AGE

of Fay & Bowen, Auburn, N. Y.; Hunter Arms Co.'s hubs; Springfield Drop Forging Co.'s wrenches, one and two-piece crank hangers and forged fork crowns, seat clusters, one-piece heads, etc.; steel balls made by the Hathorn Mfg. Co.; Snow chains; Syracuse Arms Co.'s pedals; brazed handle bars, fork sides, head stems, etc., made by the Toledo Tube Co.; Independent Supply Co.'s expanders; Brennan adjustable handle bars, and Fiber buckskin grips.

#### FEATURES OF KEATING MODELS.

The curved line in the frame of Keating bicycles serves a higher purpose than those who look upon it as a mere talking point care to admit. With it the downward stroke of pedaling produces a twisting, instead of a breaking strain at right angles, on the seat post mast, removing the danger of springing the frame out of line or fracturing the tube near the crank hanger. It also serves as a most important brace to the crank hanger, in overcoming the greatest strain on a frame, which is the pulling strain exerted by the chain. This is not generally appreciated by the average rider, although the value of rigidity at this point cannot be overestimated. Always identified with lightness in construction, the Keating Wheel Company of Middletown, Conn., preserves this valuable feature in its models. In its recently issued catalogue it gives prominence to its double roller chain, which is so constructed as to avoid all possibility

of stretching, to be self-cleaning, and to be efficient under all circumstances. The front fork crown is forged—axles are hollow—there are forty spokes in the rear wheel, to give strength and prevent buckling.

The Keating line is as follows: Thirty-inch wheel model; weight, 21 pounds; price, \$75; with 3½-inch drop to bottom bracket. Two light roadsters listing at \$50, weighing 22 pounds, and fitted without curve in seat mast when so required. Two cheaper roadsters listing at \$40, and weighing 22 pounds, and two Mattabesett models listing at \$35 and weighing 25 pounds.

#### ROBINSON'S GRIP FASTENER

This grip can be instantly attached by simply pushing it into place on the handle bar and tightening the screw at the end of the grip, and can be removed just as quickly and simply. The fastener is independent of the grip and can be used with any ordinary grip

THE CYCLE AGE

on the market in which a hole can be bored through the end tip. The device consists of a wood spool or thimble with split sides and tapered bore, which fits inside the metal handle bar; a cone-shaped metal expander which fits inside the wood spool and expands its sides against the inside of the bar when drawn up by the screw bolt inserted through the end of the grip; and a lock washer with protruding teeth on both sides which are forced into the end of the wood thimble and into the inner side of the grip end as the screw is tightened and the grip drawn up against the thimble by the screwbolt. This lock washer prevents rotation of the grip on the bar. Small lugs on the tapered plug engage the slots in the wood thimble and prevent the plug turning with the bolt. This expander device is so simple and cheap of construction that it can be supplied to manufacturers at a price that will enable them to adopt it on their cheapest as well as their best grades of bicycles. It is one of the sundries being sold by the Plew Saddle Co., 1446 Wabash avenue, Chicago.

#### TRIBUNE AGENTS IN NEW YORK.

The New York agency for Tribune bicycles has been placed with Tom Ward, 35 Barclay street and Fifty-fifth street and Eighth avenue, and with Arthur Townsend, 35 John street, who has for years worked in conjunction with Ward. To those who are acquainted with the retail trade in New York city, the extent of this deal will be apparent. These well known dealers sell several thousand machines each season and it is safe to say they will do the Tribune justice. J. H. Toole closed with them for the Black Mfg. Co., and it is stated that the first order given has still further increased the night and day work of the Erie factory.

#### TOOL FOR REMOVING INNER TUBES.

The accompanying illustration shows a simple tool recently patented by Phelps & Brenner, 729 Main street, Quincy, Ill., and which will soon be placed in the market

THE CYCLE AGE

by them. The tool is for the purpose of loosening inner tubes, which are stuck fast to the casing of tires, and resist the ordinary efforts of the workman to pull them out. It comprises a long piece of flexible wire bent into the form of a ring at one end, and having a handle at the other. This ring is slipped over one end of the inner tube at the lacing hole, and then the wire is pushed into the tire, the ring separating the tube from the casing as it goes. The tool cannot injure the inner tube in any way, and has proven very effective and handy.

#### CHAINLESS BICYCLES FOR WINTER RIDING.

"Bicycle Riding in Winter" is the title of a leaflet issued by the Pope Mfg. Co., setting forth the advantages of bevel gearing in winter cycling. The gist of it is that bevel gearing, being inlaced, cannot be im-

peded by snow, slush, or mud. Over the wholly or partially packed snow of city streets it may be propelled without undue exertion, and even the country road, only partially broken after recent snows, may often be negotiated with small difficulty. There are no sprockets and chain to become clogged with particles of ice or snow, nor to be stiffened by the action of the cold on the lubricant. Those who cycle chiefly for pleasure or exercise may thus take their recreation practically all the year around, and those who use the bicycle for convenience and economy need not return for three months of the year to wearisome tramps to or from business or work, nor to the expense, stuffiness and general discomfort of riding in public conveyances.

#### CHASE & CO.'S NEW POLICY.

L. C. Chase & Co., 129 Washington street, Boston, announcing their new policy to the trade, state that the apparently large profits made in the tire business have induced manufacturers to pursue extravagant and ridiculous methods of selling, and to an extension of credit to parties not entitled thereto, which the Chase company, in an extensive experience covering a period of more than thirty years in the manufacture of various lines of goods, has never before had to contend with.

While it has built up a large business, the risks and methods are objectionable, and the firm has decided to offer Chase tires to the trade on the same business basis that it has found so successful in building up the large plants in its several other lines. In other words, it believes in large sales, conducted on an economical basis, and the marketing of a good article at a small but sure profit.

The company states emphatically, however, that while thus changing its selling policy the Chase tires will this year be better than any heretofore produced owing to the adoption of recent improved methods of manufacture.

#### AMES & FROST CO.'S IMPERIALS.

Imperial bicycle Model 100, for men, is the highest-priced machine in the line of five

Model 100—30-inch wheels. Price, \$55.

Model 91—Ladies roadster, Price, \$50.

patterns made by the Ames & Frost Co., of Chicago. It is a 30-inch-wheeled machine built in two heights of frame, 23 and 25 inches. The fork crown is of the hollow forged arched pattern matching the flush joint construction at other frame connections. The wheel base is 46 inches, and the hanger drop 4 inches. The finish is in plain black highly polished. Models 90 and 91 are the company's standard \$50 patterns for men and women. The general construction is the same as that of Model 100, though 28-inch wheels are used. The \$35 machines are Models 80 and 81. These bicycles have flush joints, except at the hanger, and are finished in black, maroon or green, striped and decorated. Instead of the Baldwin chain, which is fitted to the previous patterns, "Diamond" block chains are used on these. The tire options include Morgan & Wright double tube, and Hartford No. 70 single tube. The \$50 and \$55 models are fitted with Hartford No. 80, single tube tires, with the option of either G. & J., or Dunlop detachable. Wheeler, Lerch, Gordon, and Gilliam are the saddles specified.

#### ADVANTAGES OF RAWHIDE FOR SADDLES.

The peculiar nature of rawhide, together with the treatment given it by the Hollenback Saddle Co. of Syracuse, renders the use of a wood or metal base for the new Rawhide saddle wholly unnecessary as a means of keeping the top in shape. It is this that makes it possible to bring the weight down to 12 ounces, a reduction that has an importance in view of the advent of 30-inch wheels, large sprockets, lengthened chains.

and generally slightly heavier construction of bicycles. Another effect secured by the use of the rawhide is the translucency of the seat, which lends a bit of novelty to its use and gives a lighter look to the machine. Thirty makers of high-class bicycles have already indorsed the Rawhide saddle by adopting it as part of their equipment. This saddle, together with others of the Hollenbeck line, will be exhibited in space 94, at the New York cycle show, January 21 to 28.

**THE SAGER GEAR IN MIDWINTER.**

As demonstrating the possibilities of the roller pin chainless driving gear for bicycles in midwinter, the Sager Gear Co., of Rochester, N. Y., cites the century ride on New Year's day made by F. Crestlik, who started from Buffalo at midnight and rode to Rochester in sixteen hours, including stops which reduced the actual riding time to twelve hours. The temperature was many degrees below freezing and the roads were so badly drifted with snow and then broken up by teams that Crestlik was compelled to ride most of the way on the frozen crust of the snow at the side of the roads. He did not know what gear he was riding until he reached Rochester, when he was told by Mr. Sager that it was 108 1-16.

**THE ERICKSON AUTOMATIC BELL.**

Nutter, Barnes & Co., 364 Atlantic avenue, Boston, are sole manufacturers of the automatic alarm here shown attached to the machine. The gong is rigidly attached to the end of the clamp bracket on the fork, but the disk covering the internal mechanism and carrying the little wooden pulley has a limited arc of revolution on the central pivot. To a stud on this disk opposite to the pulley is attached a cord running to the small finger lever on the handle bar. Pres-

sure on this lever pulls the cord and rotates the disk sufficiently to make the pulley contact with the rubber tire and the alarm to be sounded. The gong may be removed for cleaning the parts. All the attachments are furnished with the bell and are nickel plated, the gong being highly polished.

**PLEW SADDLE CO.'S SUNDRY LINE.**

A new catalogue has just been issued by the Plew Saddle Co., 1446 Wabash avenue, Chicago, which embraces a number of lines that should attract the attention of the trade. The company manufactures the Plew "soft nose" saddle, the Plew hub, and Plew lamp, and acts as selling agent for the Indiana Mfg. Co.'s Peru wood rims and Behse mud and chain guards; the Duthie Chain Co.'s Indiana and Duthie chains; the Collmer hubs; Topliff & Ely Co.'s Ely pedals; the Robinson grip fasteners, Excelsior balls, India tires, Perfection chain guards, and a line of small sundries, including grips, handle-bars, cranks, pumps, crank keys, chain adjusters, spokes and nipples. The company anticipates an increased sale of the Plew saddles, and gives an unlimited guarantee on its Plew hubs, which, though selling at a popular price, have the barrel turned from solid stock, and the cups and cones from special steel tempered and ground, every part being carefully tested before being assembled. There are no castings nor stampings in the Collmer hubs, which are self-adjusting and "fool proof."

**THE POPE BIG LINE.**

The Columbia bevel gear chainless, first placed on the market in October, 1897, survived every apprehension of its early critics, has made a most enviable record during 1898 and bids fair to rank very high in popular

favor in 1899. The main argument for the machine is that its running gear is always at the point of highest efficiency, enabling the rider at all times to cover a given distance with the minimum of exertion. The mechanism is beyond the interference of dust, mud, slush, rain or snow, and this quality of being

Model 57—Price, \$50.

Model 58—Price, \$50.

Model 49—Price, \$40.

proof against dirt and weather alone places the machine in a class by itself.

In the Columbia models 57, 58 and 61, are embodied every excellence which can enter into the making of a machine of the chain type. The main tubes are of 1 1/4-inch size with other tubes proportional. The wheel base is sufficiently lengthened to afford room for as large sprockets as may be desired front and rear. A special cutting of the sprockets does away with all danger of lost power through sliding of the chain at the points of contact with the sprockets. The narrow 3-16-inch chamfered hardened pin

Pattern 20—Price, \$35.

Pattern 21—Price, \$25.

Pattern 22—Price, \$26.

chain is used, the solid B block affording all necessary strength. The handle bars are of entirely new design and are carried forward two inches from the stem. The 4 1/2-inch tread and narrow construction at the rear hub gives these models a peculiarly compact and trim appearance. Both have the stylish low-hung crank bracket and very

handsome black enameled and gold striped special rims.

Model 61 is a machine with 30-inch wheels and frame to correspond, which in other details is similar to Model 57. Price \$60.

Columbia Model 49 is a light-running, finely-balanced, handsome road machine which was a favorite with a large class of riders a year ago. It is the same in pattern and general equipment as last year, but has been greatly improved by changes at the head which strengthen the frame construction materially.

The company has devoted especial attention to the production of tandems of the double diamond and combination types, and believes that the present models are the strongest, safest and easiest running tandems ever manufactured. They are offered as embodying everything essential to the comfort, convenience and perfect enjoyment of the many who find exhilaration and pleasure in riding machines of this class.

The frame lines of the Hartfords have been brought into conformity with the most approved ideas of design, and the new machines show flush joints, internal expanders at head and seat post, new crank shaft construction which does away with the keyed-on crank, and other important improvements.

In placing the Vedettes on the market the company has sought to supply the best bicycles obtainable at the Vedette price. The Vedettes are well made, strong and handsomely finished machines.

**SUNDRY BUSINESS TRANSFERRED.**

A. G. Bagley & Co., 172 South Clinton street, Chicago, have succeeded to the sundries business of the Chicago Plating & Enameling Co. and the Standard Machine Co. and to the bracket manufacturing branch of the Bridgeport Gun Implement Co. Bagley & Co. now own all the tools, stock and patents of these firms covering the manufacture and sale of toeclips, lamp brackets and coasters, and are now manufacturing these specialties, in addition to doing nickel plating and enameling for the trade, and

are prepared to fill orders in large quantities for Bagley clips, Star brackets and Standard coasters, clips and brackets. The Standard brackets are made in eight styles, for the head, forside and axle, made of stampings, steel castings and bent wire, one of the cast brackets being made with three arms for use on a tandem where three lamps are desired. Eight styles of Standard toe clips are also made of stamped steel and wire, one of them being adjustable and having a corrugated rubber tread and a wire passing over the toes from side to side to prevent lateral movement of the foot.

**WOLFF-AMERICAN CHAINLESS MODEL.**

Last week the agents of R. H. Wolff & Co. were notified that the firm was prepared to supply chainless bicycles, of Sager gear pattern, listing at \$75 and weighing 28 pounds. The model has just been completed and has a fine appearance. Already the house has received many orders for machines of this pattern, but flattering though this is, it is clear from the orders simultaneously placed for chain models that there is no danger of the new comer in the Wolff-American line immediately superseding the other and better known patterns.

**LARGE SHIPMENT OF IMPERIAL BICYCLES.**

An order for 800 Imperial bicycles has been received by Ames & Frost Co. of Chicago from Beard, Goodwillie & Co. of Port Huron, Mich., who have been Imperial agents for that vicinity for several years. The first 500 of these bicycles have been shipped in two large furniture cars and constitute the largest single shipment of bicycles into that state that has ever been made. Although this agency usually orders in large quantities, this shipment is larger by more than 100 machines than any it has ever received before.

**PUNCTURE PROOF TIRE HAS MANY FRIENDS.**

The Milwaukee Patent Puncture Proof Tire Co. of Milwaukee, Wis., is so gratified

by the many testimonial letters received from riders of its new puncture proof tire that it has gathered together and published some of them in an attractive booklet, thus letting the trade and public generally know of the satisfaction which the users of the tire have experienced. Each friend of the tire, in writing, tells the same story of having ridden constantly during a season without a puncture. A few well-printed half-tone illustrations give the pamphlet an attractive appearance.

**THE BARNES LINE OF SPECIALS.**

The advance catalogue of the Barnes Cycle Co. of Syracuse, N. Y., which is just out, shows a very complete line of bicycles for the season's trade. The company has been

Model 20—Special roadster. Price, \$50.

Model 23—Superba, roadster. Price, \$50.

generous in catering to the classes of buyers who desire specially made machines that different from the usual type of road machines. For them it has provided two chainless models, a track racer, two road racers fitted with 28 and 30-inch wheels respectively, while for others there are provided two regular road models and double diamond and combination tandems.

For road work and hard riding the Barnes Special, Model 20, is a graceful, sturdy, easy running machine. The style of the frame has been slightly changed, giving more rake

Model 21—Road racer. Price, \$65.

Model 22—Track racer. Price, \$65.

Model 29—Road racer, 30-inch wheels. Price, \$65

to the head and front forks, and a little more drop to the crank hanger.

The ladies' roadster, Model 23, is built on practically the same lines as last year, except that the crank hanger has a trifle more drop. This design of frame has proved very popular with ladies on account of the generous amount of dress room afforded, without sacrifice of the stylish appearance of the machine.

The road racer, Model 21, is extremely light, and especially designed as a gentleman's pleasure mount, or for road racing and easy country touring. In its make-up the material is so perfectly distributed that there is nowhere a sacrifice of strength for lightness. The wheel base has been slightly reduced, bringing the rear wheel closer to

the seat pillar tube. Twenty-six-tooth front sprocket is the largest that can be used on this model.

Many improvements have been made in the White Flyer track racer, Model 22, which has been well introduced through the many victories it has won. The frame has been slightly changed, giving a trifle more rake to the front forks. The head and front fork crown will be enameled in royal purple. This finish, together with the well-known quality of the bicycle, will make it a popular mount for racing men.

The 30-inch wheel road racing machine, Model 29, is presented by the Barnes Company with confidence that "it is as good as they make." With a 4-inch drop to the crank hanger and a level top bar, the head is necessarily rather short, especially in the 22-inch frame, in which it is 4 3/8 inches; however, care is taken to give this model equal strength to that of any of the others.

Some changes have been made in the outline and weight of the chainless machine, Model 27. The crank hanger has a drop of three inches, the same as in chain models, and with the same general outline of frame. The driving mechanism is entirely incased, and thus kept free from dust and dirt.

The ladies' chainless is similar in general outline to Model 23, except that it has the

Model 27—Chainless. Price, \$75.

Model 28—Ladies' chainless. Price, \$75.

Model 24—D. D. tandem. Price, \$100.

Model 25—Combination tandem. Price, \$100.

bevel gear driving mechanism. With a low drop to the crank hanger, and the general outline of frame, a liberal amount of dress room is afforded.

No change has been made in the tandem models except in equipment, the truss frame having been found from experience well adapted to withstand an unusual amount of abuse. The combination machine has a front top bar that can be removed without tools.

**ELDREDGE AND BELVIDERE BICYCLES.**

The Eldredge and Belvidere bicycles are very handsomely catalogued in the booklet which the National Sewing Machine Co. of Belvidere, Ill., has issued, and is now distributing. The line is made up of nine models, all representative of the skill of the designers and constructors at the company's factory. The Eldredge Extra, Model 25, is a man's 30-inch wheeled road machine with flush joints, attractive conservative lines, and embodying all of the best special Eldredge features. The list price is \$60. Eldredge Model 25 is a woman's 30-inch wheeled machine to match the Extra. Outside of the enlarged wheels and the necessary changes in frame measurements the design is similar to the regular drop frame Eldredge and also sells for \$60.

Men's and women's patterns in the Model 30 are the standard Eldredge machines, and list at \$50. The racer, which has light outside joints, one-inch tubing and a reputation honestly earned for it by Miller of long-distance riding fame, lists at \$50, as does also the ladies' little robin's-egg blue dia-

mond machine. Belvidere Model 10 is made for both men and women, and sells for \$40. The Eldredge double diamond, single steering tandem lists at \$100.

All machines are fitted with the Eldredge single tube tire, made by the B. F. Goodrich Co., although the Dunlop is offered as an option. Eldredge models have the company's special two-piece hanger, except the 30-inch wheel machines, which have three-piece keyless hangers, while the Belvideres are fitted with three-piece keyless crank and axle groups. Wheeler saddles, with the Hunt Model 50 as an option, are offered as the regular saddle equipment, and the riders are given the choice of bars of five different adjustable and rigid patterns. Front wheel plunger brakes are supplied if desired.

**LARGE LINE OF FANNINGS.**

The Fanning Cycle Co. of Chicago, has a line of bicycles ranging in list price from \$30 to \$50. The line allows an agent to meet all demands in the matter of price, there being a ladies' and a corresponding men's pattern at every \$5 raise in price above the lowest-priced bicycles. The ma-

Model L—Weight, 24 lbs. Price, \$40.

chines weigh about 24 pounds each, and all have flush joints. The hanger used is of the two-piece variety, in which the division is made at the left end of the axle. Hanger drops are 2 1/2 and 3 inches. The standard finish is Brewster green, though cardinal and black are offered as options. Front sprockets, which are made after the company's own special design with heart-shaped openings between the spokes, are furnished in sizes ranging from 24 to 28 teeth. The handle bars and seat posts are secured by internal expanders. Morgan & Wright, or Kokomo tires are regularly fitted, with Palmer, G. & J., Hartford or Goodrich as options. Bridgeport and Star pedals are used, and the standard saddle is the Gil-

Model M—Weight, 25 lbs. Price, \$40.

Model K—Weight, 25 lbs. Price, \$35.

liam. The line also embraces a 30-inch wheeled men's model, and a track racer weighing 21 pounds.

**ARNSTEIN'S COMPLETE CATALOGUE.**

One of the most complete catalogues of bicycle parts, fittings, sundries and supplies ever issued has just been gotten out by Eugene Arnstein, 88 West Lake street, Chicago. It embraces everything needed in the production, decoration and equipment of complete bicycles, from lathes and tube cutting machines to enamels and transfers, and from tires and saddles to repair outfits and watches. It includes also assembled bicycle frames and bicycles complete with equipments. Specifications, dimensions, stock numbers and prices are complete.

**SECURES NUMBERING MACHINE CONTRACT.**

L. J. Burdick, manufacturer of cyclometers and recording machines, has recently closed a contract with the Buescher Mfg. Co. of Elkhart, Ind., to manufacture his counting machines, which embody the same me-

THE **Waverley**

Continues to Defy Competition for

**1899**

All the resources of the great Indianapolis factories are called into play as usual this year to make for Waverley agents and Waverley riders a line of Bicycles that shall provide for all wants and meet all requirements of purse and service. Here are the machines and the prices:

**Waverleys**  
**\$40** For Men  
For Women

Ivanhoe Specials . . . \$35  
Two sizes for men; one size for women.

Ivanhoes . . . \$25 and \$26  
Two sizes for men; one size for women.

The Waverley Bicycle is, as always, the best that can be produced by bicycle skill and knowledge and almost unlimited resources. We will tell you more of them next week.

You will marvel at the quality and elegance of the Ivanhoe line—made in a separate portion of our factories, devoted to Ivanhoes exclusively. Choice of equipment limited, that's all.

Send quickly for details and make sure of the agency.

**INDIANA BICYCLE COMPANY**  
INDIANAPOLIS, IND.

chanical principles as his cyclometers but are designed for use on presses and all machines when it is desirable to count the output. There is a large demand for this kind of an instrument, and under the well known high class workmanship and mechanical exactness of the Buescher factory this one may be expected to meet with the same success as the Burdick cyclometer.

**AN ATTRACTIVE SUNDRY.**

The "Perfect" pocket oiler, as exhibited at the Chicago cycle show, is handsomer than ever. The workmanship is of the best quality and the finish is a fine example of nickel plating. Such a sundry, while inexpensive, is important, and by its attractiveness creates a good impression in favor of any bicycle on which it forms part of the equipment. The makers, Cushman & Denisons, of New York city, will also have an exhibit in space 59 at the New York show.

**VIKING MODELS AND PRICES.**

The Viking Mfg. Co. of Toledo, in designing its track racer, Model 21, has provided for close pace following and given the machine a moderately long head with low frame by

Model 21—Racer, 26-inch front wheel. Weight, 20 lbs. Price, \$65.

Model 30—Ladies' roadster, Weight, 25 lbs. Price, \$50.

Model 32—Road or track racer. Weight, 22½ lbs. Price, \$50.

Model 34—Three crown frame. Price, \$50.

equipping it with a 26-inch front wheel. The machine, which weighs 20 pounds, and sells at \$65, has flush joints except at the hanger, and is enameled Viking blue. Model 39, a ladies' bicycle selling at \$50, has a double curved front frame, flush joints, 3-inch hanger drop and a decorative metal chain guard covering both sprockets. A light road

or track wheel weighing 22½ pounds is offered in Model 32, which with the exception that it has a 28-inch front as well as rear wheel, is similar in appearance to Model 21. Model 34, also listing at \$50, is a three-crown machine in other particulars similar to the previous pattern. The 30-inch Model 10, sells for \$45. It has the Modan two-piece hanger and flush joints except at the bottom bracket. Models 11 and 12 are men's and

Model 10—30-inch wheels. Weight, 25 lbs. Price, \$65.

Model 11—Weight, 24 lbs. Price, \$35.

women's patterns selling at \$35. Morgan & Wright, Dunlop, and Hartford tires are the regular equipment. All machines have arch crowns, and Indianapolis chains are used throughout the line. Generous options in handle bars, saddles and gears are offered. The \$50 and \$65 machines have special two-piece hanger groups and eccentric chain adjustment.

**REMINGTON CHAIN AND SPROCKET.**

The object sought to be accomplished in the designing of the Remington Special chain used on the machines made by the Remington Arms Co., of Ilion, N. Y., was to produce a chain of increased strength which would run with less friction than the ordinary bicycle chain. It will be noticed that the form differs materially from those commonly known as figure 8 and B block styles

and that it requires special sprocket wheels with teeth divided to permit the two outside links of the chain to come in contact with the teeth. By this construction there are two points of contact instead of one and as they are separated to the full width of the chain there is no tendency to twisting of the chain and side sway. Lateral vibration is further reduced by having the rivets fit tight in the center links and free

in the outside links, thus widening the pivotal points of the chain links, which has an effect similar to the widening of the driving face of the sprocket tooth with the ordinary chain. The construction of the Remington Special chain is therefore a reversal of the ordinary chain and sprocket relation. The construction is such that it permits of the use of sheet steel in the manufacture of the driving link with the grain of

the metal running in the same direction as that in which the strain is applied, and it is also possible to reduce the weight as compared with the ordinary 3-16-inch block chain. Tests of the Remington Special chain have been made by running them on a jack at a tension of 200 pounds and for a length of time equal to a distance of from 100 to 1,000 miles with only 4-1000 of an inch variation in the entire chain of fifty-four links at the end of a 1,000-mile test. The tensile strength of these chains has been found to be from 1,750 to 2,000 pounds, with an elongation of 4-1000 of an inch in the entire length without breaking.

**HALL-SHONE CO. TO CHANGE NAME.**

The Hall-Shone Co., of Rochester, N. Y., has been granted permission to change its name to the E. H. Hall Co., by County Judge Sutherland. The change will take place July 1. It is stated in the petition that all the stock is now owned by E. H. and H. L. Hall and families, and for that reason the change of name is desired.

**PATEE CRESTS IN FOUR MODELS.**

The Patee Bicycle Co., of Peoria, Ill., is offering its old agents and friends, as well as those dealers who are preparing for the first time to wage the battle for business under the colors of the Patee Crest, four patterns of machines ranging in price from \$35 to \$45. All of these machines are built with low rakish frames, have Fauber hangers, with diamond-shape cranks, and are constructed with flush joints throughout. The front fork crowns are of the outside

Men's roadster—Weight, 24 lbs. Price, \$35.

Ladies' roadster—Weight, 24 lbs. Price, \$35.

Racer—Weight, 22 lbs. Price, \$40.

lap arch pattern, and are nickel-plated. The regular road models for men and women weigh 24 pounds each, and are enameled in black, green, maroon or orange to suit the purchaser. The machines are fitted with the company's special guaranteed single tube tire. The Patee Crest Orange racer has a longer frame and a shorter head than the regular patterns, and is equipped as a fast racing machine for track and light road work. It is fitted regularly with a light tire 1½ inches in diameter, and able to stand usage on the road. Unless otherwise ordered the finish is in a special orange, which gives the machine its name.

*Adlake Special*

Removing Rear Wheel from Frame Without Disturbing Adjustments or Detaching Chain.

Rear Wheel Removed from Frame, All Adjustments Left Undisturbed.

**New Patent Rear Fork End**—To remove rear wheel in order to repair tire or change rear sprocket it is only necessary to unscrew with pocket wrench two small bolts in the fork ends. The wheel may then be entirely removed from frame without disconnecting chain or disturbing either chain or bearing adjustments. Every part, except the two bolts, remains attached and in its proper place.

**Chain Adjustment**—No amount of handling can loosen or lose any part pertaining to this important mechanism. By this arrangement the rear wheel may be removed and replaced in 30 seconds, with every part and every adjustment in its proper place. Is very simple and positive. The little hangers which hold the rear wheel are pushed back by screws and held by lock-nuts in any desired position.

**The Adams & Westlake Co. makers Chicago**

Mention The Cycle Age

Also Makers of Adlake and X Rays Bicycle Lamps and Adlake Cameras

While the Patee Bicycle Co. does not advocate the use of 30-inch wheels, it has placed in the line such a model selling at \$45, in order to meet the possible needs of its agents for such machines. In general construction and equipment it is similar to the regular patterns. Any choice of tires is granted on this model. The options in saddles and handle bars include various standard patterns of each.

#### TRUING AND LACING DEVICE.

The truing device and lacing stand made by the Eureka Supply Co., of St. Paul, fits all hubs, and is adjustable to all sizes of rims. It will hold the rim firmly and preserve its circularity. It is made in two parts which may be folded together, and weighs only 4 pounds. The device saves a great deal of time, as with it only 18 to 20 minutes are required to set and complete a wheel. It will pay for itself in a short time. The stand may be fastened on the work bench.

#### HOLLENBECK SADDLES AT THE SHOW.

While the Hollenbeck Saddle Co. of Syracuse has no exhibit at the Chicago cycle show, the visitors are given ample opportunity to inspect the new light-weight Rawhide saddle. The exhibits of Eugene Arnstein, the Snell Cycle Fittings Co. and Brown & Wales had samples of this saddle among the other goods displayed and the little 12-ounce seat was to be seen fitted to Sterling, Snell, Carlisle, Stearns, Dayton, Yale and Ariel bicycles.

#### AN EXCELSIOR SOUVENIR.

The Excelsior Supply Co., 88 Lake street, Chicago, is mailing to its patrons and friends a neatly printed booklet containing the words of Longfellow's familiar poem, "Excelsior," together with illustrations which lend the book the appearance of a charming little souvenir. The work is strictly one of good will, there being no advertising whatever between its covers except a picture of the new home of the Excelsior Supply Co.

#### WORKING OVERTIME ON BI-GEARS.

The plant of the Brown-Lipe Gear Co., Syracuse, is running overtime now to supply customers with the two-speed gear, recent shipments of 250 of which have been made to one large Cleveland firm. The "bi-gear" makers have also worked up a big foreign trade. H. W. Chapin, manager of the company, states that the outlook for a large volume of business during the next few months is entirely satisfactory.

#### NIGHT WORK ON BUESCHER SPECIALTIES.

The Buescher Mfg. Co. of Elkhart, Ind., makers of a complete line of bicycle pumps, toe clips and other specialties, began running its plant nights in December, whereas heretofore it has never commenced night work before the last of January or in February. This not only evidences an unusual activity in the industry, but the steadily increasing popularity of the Buescher products.

#### TRADE NOTES.

Fred A. Trowbridge, formerly manager and buyer of the bicycle department of the United States Net & Twine Co., in New York, who have retired from the bicycle business, is now connected with Cornwall & Jespersen, 310 Broadway, New York city, who are the eastern representatives of the Columbus Bicycle Co., as manager of the bicycle department.

J. M. Fisher, for a number of years connected with the Newton Rubber Works, is now representing the White Sewing Machine Co., of Cleveland, in New England territory. Mr. Fisher's extensive acquaintance among the trade will make his services especially valuable to the makers of the White bicycles.

Frederick J. Haynes, who has for several years had charge of the bicycle department of the Hunter Arms Co., at Fulton, N. Y., has gone to Toronto, Can., to become superintendent of the Canadian factory of E. C. Stearns & Co.

The Shelby Steel Tube Co. has begun running the rolling and piercing mill at the Shelby, O., factory all night on a large order from the government for boiler flues for war vessels.

A complete line of Racycle bicycle models made by the Miami Cycle & Mfg. Co. of Middletown, O., is being exhibited this week at the Great Northern hotel by Mr. Borderwisch.

Orrin D. Bartlett of New York city, who has been connected with the cycle trade since the advent of pneumatic tires, and is well known through his long connection with the

Gormully & Jeffery Mfg. Co. of Chicago, is now connected with the Keating Wheel Co. of Middletown, Conn., as advertising manager and superintendent of agencies. His face has been a familiar one at all cycle shows and national meets for many years.

#### GROWTH OF MEISELBACH'S BUSINESS.

From Humble Beginning in 1895 It Has Become One of the Largest in the Country.

One of the most notable individuals in the bicycle industry is A. D. Meiselbach, whose remarkable success during the last three years is a striking example of the energy and progress of the times. Starting from the humblest beginnings in '95, he has developed a business the value of whose product in '98 amounted to almost \$2,000,000 and which now regularly employs 800 workers at a total annual wage of \$200,000. Last year he employed 200 more men than he did in 1897 and the prospects are that the demands of his business will necessitate a further increase.

He manufactured for the 1896 trade 15,000 bicycles, for the 1897 trade 35,275 and in 1898 he sold upwards of 75,000 machines. During the last year he made substantial additions to his factory, increasing the floor space by 20,000 square feet, so that now there are 225,000 square feet in the factory, which has a capacity for building 150,000 bicycles annually. He also built an electric light plant to illuminate the factory and also to supply the light for the town of North Milwaukee. This plant cost \$10,000, while the factory, exclusive of machinery, is worth \$125,000 and the machinery \$100,000 more.

The development of this business and the outlook for the future show conclusively that the bicycle business, far from being on the wane, is improving. Whereas last year there were orders for only 32,000 bicycles in advance, the firm already has on hand for this year orders for more than 60,000 machines, so that the business for the coming season promises to be even more phenomenal than that of any other year since it was established.

Every part of the bicycle is manufactured in the plant except a few patented parts which have to be purchased from the concerns which manufacture them. The constant increase in the demand for the Meiselbach machines is the best testimonial for their worth. Mr. Meiselbach has also established a reputation for fair dealing, so that the trade have learned to rely implicitly on his representations in regard to his goods. A. D. Meiselbach, who is the sole proprietor of this industry, is a young and energetic man, 36 years of age, and has been in the bicycle business for twenty years. He has worked at all branches of it and knows it thoroughly. It is because of his knowledge that he has been so successful at it, as he personally superintends the entire business and there is not a day that he does not look over the factory and make improvements in the methods of turning out the work.

#### Changes in the Trade.

Joseph T. Kelly, a bicycle dealer of Dubuque, Ia., has filed a voluntary petition in bankruptcy.

B. F. Chambers has withdrawn from the firm of Roth & Chambers, wholesale and retail dealers in bicycles and sundries in Erie, Pa., and the business will hereafter be conducted at the same place by his former partner, Jacob Roth.

The plant of the recently organized Goodyear Tire & Rubber Company, at Akron, O., will begin operations very soon, employing 250 workmen at the start. Orders sufficient to keep the plant going for six months have been secured.

V. B. Perrine, a lumber dealer of Ft. Wayne, Ind., has taken a controlling interest in the Huntington, Ind., bicycle works, which will be continued at Huntington under the management of D. Fenton, of Brooklyn, N. Y., a brother-in-law of Mr. Perrine.

Fred C. Chase and Archie Matheis, of St. Paul, Minn., have entered into partnership under the style of the Archie Matheis Cycle company, to do a general bicycle business. They have secured quarters and opened their doors at 96 East Fifth street, St. Paul.

# THE PASTIME AND SPORT

## GIMM WINS CHAMPIONSHIP

Twenty-Four-Hour Race Ends In Brilliant Sprint—Miller and Waller Quit.

New York City, Jan. 9.—The twenty-four-hour championship contest at Madison Square Garden ended at 10 o'clock last Saturday night in one of the most exciting finishes ever seen on the cycle track. As the race neared its close there were four contestants riding together a mile or more in the lead of the others who were asked to retire during the last fifteen minutes, leaving the track clear for the final sprint of the four certain winners. When this request was made, John Lawson, who was three laps behind the leaders, succeeded in catching them napping and gained a lap, but was unable to repeat the performance.

The order of the finish was Gimm, first by a wheel length; Pierce, second; Turville, third; Frederick, fourth, and Lawson, fifth. The four leaders covered 450 miles in the twenty-four hours. First prize was \$1,000; second, \$400; third, \$250; fourth, \$150; fifth, \$100, and all who finished secured prizes.

The race was a heart-breaking one from the start. Frederick, Pierce, Turville, and Gimm never left their saddles for a moment. They even refused to take nourishment and stimulant from their trainers when the sprint was on. Everybody realized that to fall behind a lap would be fatal. Waller lost a lap through an accident to his tire Friday night, and for fifteen hours he made a brave struggle to regain his lost ground. All through the day there was a succession of desperate sprints, in which the riders took long chances, and even risked their necks to gain a lap on one another. Eighteen men started Friday night, but at the end of twenty hours nine of them had been compelled to give up the struggle.

Pilkington and Albert fell early in the race and quit. Hicks quit at 9 o'clock in the morning for the same cause. Nawn retired an hour and a half later, because he could not stand the alternating fast and slow pace. Ashinger trailed along painfully at the end of the line through the morning. He was evidently suffering and not in condition and was therefore declared out of the race. Aaronson also had enough early in the morning.

Miller was the first of the eleven leaders to leave the track. But the fast bunch soon dwindled to eight. Later in the day Chapman and Barnaby retired, and also Waller. Then Stevens who had been in every sprint from the beginning of the race and was a great favorite with the crowd had to quit at two minutes after 7, after having been in the saddle twenty-one hours. From the moment Stevens retired and left only four men tied for first position a steady, killing pace was maintained.

The final score was as follows:

Gimm .....	450	..
Pierce .....	450	..
Turville ..	450	..
Frederick .....	450	..
Lawson .....	449	6
Julius .....	437	6
Hale .....	433	4
Miller .....	422	6

## Three-Days' Meet in Moscow.

A three-days' race meet run at Moscow, Russia, on December 25, 26 and 27, attracted immense crowds. The principal events were twenty-one match heats between the champions, the winner of the greatest number of first places to be de-

clared the winner. Seven heats were run each day, the distance being one and one-half versts. Strangely enough, the heats resulted in four firsts and two seconds each for Bourillon, Singrossi, Waschke-witch and Dei, while Parlby finished in first place once and in second place five times. After the last heat the judges proclaimed Singrossi winner. This was received with tremendous hisses and was protested by Bourillon, Waschke-witch and Dei. The international race at one and one-half versts was won by Bourillon by twenty meters from Singrossi and Dei.

## MOTOR VEHICLE MATCH RACES

Twenty-Kilometer Contests Excite Parisians—Riders and Machines Equally Matched.

By hooting and jeering at Fournier's queer looking petroleum tricycle in its first appearance on the race track in this country the American race-goers only exposed their ignorance of the progress that motorcycles have made abroad, especially in France, where especial race meets are now promoted solely for the competition of riders on these machines and attract large crowds of spectators.

On December 19 a twenty-mile match was run between Baras and Marcellin, two prominent French motorcycle riders, on the Prince track, Paris. It was an exciting event, the twenty kilometers being covered in 24:34. In the third lap Baras came to a standstill, because of a loosened screw and a new start had to be made. Baras took the lead, but after going nine laps was overhauled by Marcellin and passed. Then Baras came up and for eleven laps the competitors rode side by side, neither being able to make any appreciable gain. At this juncture Baras desperately oiled his motor from the saddle, with apparently excellent effect, for he immediately took the lead and won the match by 100 meters.

On the following day they had a return match, which was a see-saw affair until the last lap, when Marcellin passed Baras, who was leading, and won by a length. Without stopping, he continued for the hour record, adding nearly 1,000 meters to the old figures. The distance covered was 30 miles 1,150 yards.

## Elkes Wins Match With Waller.

The fifty-mile match race between Harry Elkes and Frank Waller at Madison Square Garden on January 2 was won by the former easily in 1:50:46 2-5. Waller was given a handicap of two minutes, in which he gained a lead of eight and a quarter laps, but his pace was inferior to that of his opponent, who gained steadily on him except when the Butler brothers were pulling him around the ten lap track. At twenty-one miles and three laps Elkes passed Waller. He finished the race nine laps and ten yards in the lead.

## Cordang Coming to America,

Private advices from Paris state that Cordang has signed a contract to come to the United States next June to ride in two 24-hour races, one in the east and the other in the west, for which he is to receive \$2,000 each. Miller will be his chief competitor. Cordang will bring with him four motorcycles for pacing purposes—two electric and two petroleum. Tom Linton will return to America in company with the Dutch 24-hour record holder.

## PEACE WILL REIGN AGAIN

Pros to be Admitted to League Membership and Control of Racing Retained.

Philadelphia, Jan. 9.—The white wings of peace will be made to hover once more over the ranks of the L. A. W., it is averred, through liberal concessions made to the racing element at the National Assembly next month. These include the probable admittance of professionals to membership and representation on the racing board, and a more liberal and common-sense interpretation of the racing rules for the benefit of the amateurs.

An amendment has been proposed by Conway Sams of Baltimore, providing that all professionals and amateurs must register with the league, paying therefor a fee of \$2, which will also give them membership in the body—in other words, a mild sort of compulsory membership clause.

The Pennsylvania representatives are, and have been, favorable to the admission of professionals to League membership, and should such an amendment be offered, the Keystone division's delegates will be found almost to a man favorable to such a measure. The feeling that many racing men, both professional and amateur, have been unjustly and arbitrarily treated by the racing board during the past two years, is widespread among the rank and file of the division, and present appearances indicate that any reasonable concession which may result in the retention of League control of racing will be supported by the majority of the state's delegates.

There will be little politics at the assembly, Keenan being an almost unanimous choice for president, and there being small opposition to Herbert Foltz of Indianapolis for first vice-president, H. R. Kingsbury of Keene, N. H., for second vice-president, and D. J. O'Brien of Omaha for treasurer. The fight will therefore be on such issues, as the abandonment of racing control and the admittance of professionals to membership. To accomplish either of these changes an amendment must be passed, and it will require a two-thirds majority of votes to pass an amendment. A careful preliminary poll by mail shows that almost twice as many votes will be cast in favor of the retention of the control of racing as are needed to defeat any measure to drop it. On the other hand there appears to be an overwhelming majority in favor of the proposition to admit professionals to membership.

## Foreigners Want an American Circuit.

From personal advices it appears that the prominent French and other European riders may not cross the ocean to ride at the world's championships in Montreal next summer unless a racing circuit is arranged in the United States in which they can take part afterward. The championships come at a time when racing is at its height in Europe and large prizes are offered at numerous meets so that in coming to America four or more weeks of the best part of the season would be lost unless equal opportunities of winning prizes on this side are offered. At the big European meets first prizes of from \$500 to \$2,000 are put up, while in this country prizes seldom go as high as \$200, except in special middle distance matches or long distance open events. The foreigners therefore think that a special circuit should be arranged on which large prizes

## Plain Talks on Andrae Cycles

THEY  
NEVER  
DISAPPOINT

... IV ...

An Andrae agent has the best of it right from the start.

He has no preliminaries to attend to. The very day he receives his Andraes he can start at selling them.

He need not introduce them. He need not create a preliminary demand. We have attended to all that.

Andrae Cycles are known everywhere. The people in the agent's town know all about them. It is only necessary for him to tell the people that he is selling Andraes.

Then his business begins.

He will sell many \$60 and \$50 Andraes to the people who want the best bicycles made, but there are some people who want the best \$40 wheel. To them he will sell the \$40 Andrae.

There are 14 Andraes all told. A wheel to suit any good taste—every pocket-book.

You ought to write for our trade prices.

Julius Andrae & Sons Co.

Eastern Export Branch: 95 Reade St., New York City.

Mention The Cycle Age

will be offered. The riders willing to come over under such conditions are Paul Bourillon, who won sixty-two races out of sixty-three in which he started last season, and Jacquelin, the champion of '96 in France; Houben and Protin, of Belgium; Franz Verheyen and Paul Albert, of Germany; and some Italian and English sprinters; in the middle distance, Bouhours, Champion and Simart, of France, and Palmer, Walters and Linton, of England, could be expected to come.

### TIMES HAVE CHANGED

Retiring Racing Men Can No Longer Feel Sure of Trade Employment.

It has for many years been the custom of the cycle trade to employ ex-racing men in offices, show rooms, and works; and when the ex-racing man has a genius for office, show room or factory business, such employment is no doubt an advantage; but the idea that the ex-racing man can look forward to employment in the cycling trade with any degree of reasonable certitude, is an altogether fallacious one, says Irish Cyclist. Even if every ex-racing man were endowed with the requisite aptitude for business, it must be obvious that there can never be such a continually increasing number of vacancies as would be required to accommodate the continual flow of ex-racing men into the trade, because trade expansion is limited, and when a person has installed himself in a suitable berth, he does not expect to be kicked out to make room for the next retiring racing man.

Scarcely a week goes by but that one hears of some ex-racing man who appears to be discontented with his present occupation and to be looking around for a position in the cycle trade, with which he has not one atom of practical acquaintance. There are hundreds of capable young fellows now idle through having given up situations in businesses with which they had some acquaintance, in the expectation of obtaining more remunerative and congenial employment in the cycle trade merely on the strength of being able to ride a bicycle fast. The trade is overstocked with experienced men already, and for every vacancy there are many applicants. The racing man must be content to race for sport without looking forward to the cycle trade as a final resort when his speed begins to flag.

### Bald and Sloan as Team Mates.

Ex-Actor Eddie Bald is traveling toward the Pacific coast in company with Tod Sloan, the famous little jockey who set all England agog last summer. The jolly pair are making the trip by easy stages and having and making what fun they can on the way. They are avowedly bent on pleasure, it being Bald's desire, possibly, to forget the worriments of an all-too-brief theatrical season. The jockey sets a fast pace, but finds it hard to shake the champion cyclist except in the matter of dress, in which he can give Bald a generous handicap and still come off victor. But the Buffalonian is enthusiastic over his little team mate and says he will go to Europe with him next summer and will ride in match cycle races there.

### Pennsylvanians Want Better Roads.

The Pennsylvania division L. A. W. is preparing to make a strong fight for good roads at the present session of the state legislature. At the last session the division succeeded in securing the passage of the Hamilton bill, which provided for a radical improvement in the existing system of road maintenance, but when the measure came up for final action its opponents succeeded in having it so

amended as to be inoperative until after a state appropriation of \$1,000,000 had been made. An effort will now be made to secure this appropriation, or else obtain the passage of a measure even more advantageous than the Hamilton bill.

### Elkes Loses to Gibson and Downey.

Joe Downey and Harry Gibson, on a tandem, defeated Harry Elkes on a single in a best-two-in-three half mile heats match at Madison Square Garden on January 4. The first heat was a pursuit race, and was won by Elkes by a yard in 1:03. The second and third heats were sprint races, and were won in succession by the tandem team in 1:07 and 1:15 respectively. At the same meet Charles Ertz defeated Kraemer, the amateur champion, in a half-mile handicap in 1:04 4-5. Both started from scratch.

### Washington-Baltimore Cycle Path.

The committee appointed to investigate the feasibility of constructing a bicycle path from Washington to Baltimore has begun discussing the plans, routes, and system of tolls in connection with the project. A civil engineer is to be secured to investigate and report upon the difficulties and probable expense of the undertaking, which is roughly estimated to be from \$100 to \$150 per mile, or \$4,000 to \$6,000 in all. The popularity of such a path, bringing the national capital within forty miles of easy riding from Baltimore, and connecting it with New York and Philadelphia, is not to be doubted.

### Banker Runs Third in Algiers.

The final heat of the race for the prize of Oran, Algiers, was run on Christmas, and was a remarkable event, the three winners finishing almost in a dead heat. The judges, however, gave the race to Tommaselli, with Grogna second and Banker third by five inches.

### NEWS IN BRIEF.

A movement is on foot in New Orleans to build an indoor cycle track.

A bill for the protection of bicycle paths has been introduced in the Minnesota legislature.

Arthur Zimmerman is once more reported to be seriously thinking of returning to the race track.

Jacquelin, Bouhours, Parly and Deschamps are giving exhibition races at Marseilles, France, during January.

President A. L. Mace of the Century Road Club has issued a call for the annual meeting of that organization to take place in Chicago on February 26.

Tom Eck is at the head of a movement in Minneapolis to organize the professional skaters and bring them under the control of the National Racing Cyclists' Union.

The Springfield (Mass.) Bicycle Club has discharged all its indebtedness and will hereafter devote itself to the social side of cycling, eschewing all racing affairs.

The indoor racing season at Madison Square Garden is to be concluded Thursday night by a twenty-five-mile paced match race between Harry Elkes and E. A. McDuffie.

A. A. Taylor's New York to Albany record of 15 hours and 10 minutes, made September 17, has been accepted by the Century Road Club. The previous record was 21:54:00.

The police department in New York issued orders last week to enforce the "unconsequence a number of drivers of vehicles were arrested and fined for violating the ordinance.

Major Taylor, who is this week the center of attraction at the Chicago cycle show to local racing enthusiasts, created a mild sensation last week by joining the Baptist church in Worcester, Mass. The colored wonder is without doubt one of the cleanest

and best conducted professional cyclists in the world. He neither drinks nor smokes nor indulges in the common dissipations, and will not train or ride on Sunday.

J. S. Johnson broke the half-mile professional skating record in Minneapolis last Sunday, making it in 1:18 2-5. Weather and track conditions were bad. He was paced the first 300 yards.

The Riverside Wheelmen of New York have decided not to take any active interest in cycle racing the coming season, owing to the uncertain state of affairs at present existing in the sport.

Overtraining is ascribed as the cause of the unbalanced mind and subsequent death of Henry Krupp, a professional cyclist of Uhrichsville, O., who died in the hospital at Massillon on December 30.

The Detroit consulate of the Michigan division L. A. W. is taking steps to introduce into the state legislature two bills, one providing for the protection of bicycle paths and the other a general good roads measure.

Hereafter every person who belongs to or becomes a member of the National Cyclists' Union of England and pays his dues will be insured for \$250 against death and paid an indemnity of \$5 a week for five weeks in case of accident.

The proposed meeting of the National Cycling Association, which was to have been held in New York on January 4, was postponed to January 25, owing to the inability of some of the track owners to be present at the earlier date.

W. E. Stafford, one of Boston's best-known wheelmen, started Jan. 1 to accomplish the feat that put Teddy Edwards in the hospital last summer. He says he will ride 365 centuries within the year unless compelled to stop on account of sickness.

The French say that every German rider is compelled by law to provide himself with a book which enlightens people that "cycling in itself is not a criminal occupation" and that "a person who slays a cyclist is liable to punishment just as if he had killed an ordinary man."

C. W. Mears, chief consul of Ohio, intends to offer an amendment to the constitution and by-laws of the League at the National Assembly, providing that each division have its own official organ. The purpose must be obvious to the publisher of "Joe Lincoln's Joke Book."

Cycle path advocates of Massachusetts will try to secure the passage of a bill by the state legislature this winter providing for the taxation of bicycles at 50cents each, half of the amount to be turned into the town or city treasuries, and the other half to be expended on the construction of bicycle paths.

Peter Berlo, ex-racing man and designer of the first multicycle pacing machines used in this country, is experimenting in the construction of petroleum-driven one and two-seated bicycles with which he expects to solve the problem of satisfactory pacing. By spring he expects to have in regular use a tandem capable of a speed of 1:30.

During the past season the L. A. W. national racing board took in \$2,000 in registration fees and \$3,000 in sanction money. Out of this there had to be paid \$7,000 expense money, a salary of \$2,500 to the chairman and \$1,000 each to the seven members of the board, or a total of \$16,500. Thus if the salaries are paid, racing will have cost the L. A. W. more than \$9,500 this year.

The proposed six-day race in San Francisco seems to meet with the approval of the people of that city, who have so far raised no objection to it being run there. A ten-lap track will be built in the Mechanic's Pavilion, which will be altered for the purpose. F. McFarlane, Stevens, Freeman, Coulter, Wells and other national circuit followers are already in training for the sprint races that will precede the long grind.

Harry Terrill is again restless. Terrill ranks with "Plugger Bill" Martin as a traveler, having raced in every known racing center of America from the Pacific coast, where he lives, to Hawaii, and in Europe as well. Terrill is one of the original outlaws of California, and was never reinstated, although he raced under the L. A. W. all the past season. Terrill applied for reinstatement, but was preemptorily refused. He applied for his registration card, enclosing \$2, and got it. He now contemplates a trip to France for '99, and may leave after the close of the indoor season in New York.

## AND TRADE REVIEW

VOL. XXII—No 12.

CHICAGO, JANUARY 19, 1899.

NEW SERIES No. 61.

### OUR GERMAN TRADE IN PERIL TO BOYCOTT AMERICAN CYCLES

**German Makers Will Refuse to Extend  
Credit to Agents Who Handle  
American Machines.**

The deep resentment of German bicycle makers toward American firms which have secured orders from importers and agents in the Fatherland has suddenly assumed a very formidable character. Failing to obtain from the Imperial government the prohibitory import duty on American bicycles which they have so earnestly and persistently demanded, the members of the German Bicycle Manufacturers' Association have decided upon the following simple but ingenious plan to kill the American cycle trade:

#### The Plan of Operation.

From this time forward they will un-animously refuse all credit to any dealer who handles, as part of his stock in trade, a bicycle of American origin. The probable effectiveness of this measure will be readily inferred from the fact that the association includes in its membership nearly one hundred of the most important bicycle makers in Germany, who have been accustomed to four months' credit and very liberal terms in respect to parts and materials to be used in fulfilling guarantees and making repairs. Under this system men of energy and tact have been able to turn their money over rapidly and do a large business upon a comparatively small capital. Henceforward, if a dealer in American bicycles wishes to adapt his stock to all classes of purchasers by keeping in his assortment a German-made wheel he must pay cash for what he has hitherto easily and cheaply obtained upon long and elastic credit.

#### What Our Makers May Do.

Since the majority of independent bicycle dealers in Germany are in close-business relations with and under personal obligations to one or more manufacturers, it is expected that the effect of this heroic policy will be to seriously injure the sale of American bicycles, unless exporting manufacturers in the United States take an aggressive attitude, and, by extending and broadening their system of credits and backing up their best retail agents vigorously, make the competition so hot that the German makers, many of whom are laden with unsold wheels carried over from last season, will be compelled to make peace by rescinding the present decree.

#### Novel Plan for Instalment Sales.

A Buffalo cycle company has adopted a new system of selling bicycles on the in-

stalment plan. It advertises to receive payments of \$1 per week on a \$30 machine, crediting the purchaser with \$3 for the first dollar paid in—probably as an inducement to begin the payments in the winter. By the time the riding season opens the buyer has his machine half paid for. By putting such a plan into operation the dealer reduces the probability of bad accounts to a minimum, has capital to conduct his business with and is saved the time and trouble of making collections and the loss caused by having to recover unpaid-for machines which must be afterward sold as second-hand. The initial credit of \$2 may be considered a moderate amount to pay to escape these common losses. The purchaser, on the other hand, having his new machine half paid for when he begins to ride it, can complete the remaining payments before the middle of the summer and will have small occasion to refuse to finish them. Whether he will feel sufficient confidence in the dealer to permit him to act as his banker to such an extent before the goods are delivered is an aspect of the case that should be given some consideration.

#### Local Show Movement in Buffalo.

Some of the Buffalo cycle tradesmen believe that a local bicycle show would be a good thing for the business and are earnestly at work in an effort to induce the others to come in and make the thing a success. The trade has been canvassed during the past few days and with but few exceptions the sentiment is strongly in favor of the project. Buffalo has never had a cycle show except those annually held in Martin's church before this edifice was razed and there is little doubt that the city is ripe for a good one at the present time. The promoters have the new Glenny building on Main street adjacent to "Cycle Row" in view. This building has an immense floor space and is admirably adapted for the purpose. The question will come before the board of trade at its meeting this week and the probabilities are that the project will receive its unanimous endorsement. If held, the first week in February will probably be selected.

### AUSTRALIAN TRADE IMPROVING RECOVERING FROM DULL TIMES

**Despite Auction Sales Some Dealers Are  
Doing Good Business—Others  
Quit the Trade.**

Sydney, N. S. W., Dec. 19.—The month of December has seen a slight livening up of the cycle trade throughout Australia, consequent upon the opening of the racing season. Trade was very dull during October and November. The dealers in New South Wales have felt the dullness more, perhaps, than those of any of the other colonies, and as a consequence a few of them have got rid of their stock by means of auction sales and quit the business. One or two of the big firms have also held auction sales of their old stock ostensibly to make room for fresh shipments.

On the other hand, the Austral Cycle Agency, the largest concern in Australasia, having branches in all the colonies and six stores in different parts of Melbourne, has secured quarters in a new four-story building there, and will give up the six retail rooms and hereafter have only the one house, in which will be located the work rooms, wholesale and retail departments, and general offices. This agency is an offspring of the John Griffiths Corporation of London and handles only English machines.

#### Rural Trade is Good.

The Victorian Cricketing & Sports company, of Victoria, reports having done more business during the past three months than for a long time previously. Its trade in the country has been especially brisk. It acts as agents for one line of American bicycles and an English chainless machine.

The English & American Agency of New South Wales (Gavin, Gibson & Co.) has announced a sale of sixty American bicycles at \$47.25, a price considered ridiculously low for Australia, and one at which they ought to be quickly closed out. This firm has removed the bicycle stock from its retail store to its warehouse and installed pianos in the former. Only French and English machines are carried.

#### Some Benefit from Auction Sales.

One of the leading auctioneers in New South Wales has opened a "cycle exchange" for the disposal of new and second hand bicycles and held his first sale December 15. Although the legitimate dealers feel that these sales will injure their business, they get consolation out of the fact that it will largely relieve them of the annoyances and losses incident to the trading-in of old machines for new mounts by customers. The first auction sale was very successful and a

large number of machines were disposed of. There are a great number of persons here who declare that they will not buy bicycles until the price comes down to \$50, but as the cheapest "car" of an Australian-built machine brings \$60, they are likely to wait a long time before they can get good American and English bicycles from regular dealers at their price. Machines assembled locally from Perry's parts are being sold for \$62.50 in Sydney. They are not bad looking, but weigh about 29 pounds.

#### Local Builder Leaves the Trade.

F. Bell, of this city, who manufactured a machine that was popular locally and seemed to be doing a good business, has just surprised the trade by holding an auction sale and going out of the business. Bell catered to the preferences of the individual riders in the matter of high gears, etc. The day after he moved out of his shop another maker of a local machine moved in with the evident intention of trading on Bell's reputation.

Bennett & Wood, the busiest firm in New South Wales, are doing a good business with one of the best English machines, and now have about eighteen orders on their books, with only one machine in stock. These machines sell at \$100 and \$140.

#### French Bicycles Americanized.

As a type the French machine is almost non-existent, according to an English expert who visited the recent cycle shows held in England and France. At one time it seemed to be on the way to attaining distinction of merit and style alike; now it has neither. In style it is almost entirely Americanized; in workmanship and design it is inferior to either the British or American product. The enameling is poor, the finish imperfect and the design often faulty and obsolete. Moreover, it is clearly the product of a nation of fair-weather riders, for the gear case is unknown and the steel mud guard rarely seen. Most of the French machines have either no mud guards at all or light wooden ones, after the American fashion. On the ladies' safeties all the dress guards and chain covers are of the wood and cord variety common to American machines. Nevertheless the French bicycle appears to satisfy its patrons, and English machines were almost unrepresented at the French show, though American bicycles were numerous.

#### Import Duty on Calcium Carbide.

Washington, Jan. 14.—A quantity of calcium carbide was recently imported through the port of Niagara Falls. It was assessed for duty at 25 per cent as a chemical compound under paragraph 3 of the tariff act of July 24, 1897, but was claimed by the importers to be dutiable at only 20 per cent under section 6 of said act. The carbide is made from lime and coke finely ground, mixed in proper proportions and smelted in an electric furnace. The carbide contained in the lime combines chemically with the coke. This chemical union of the ingredients forms a chemical compound, and the United States Board of General Appraisers, before whom the matter came for decision, found that calcium carbide is a chemical compound and that it is not otherwise specially provided for in the present tariff act, and accordingly affirmed the decision of the collector in assessing it at the rate of 25 per cent.

The city of Wabash, Ind., is soon to have its street illumination furnished from an acetylene gas plant, which is now being installed by the Dietrich syndicate, a corporation formed for exploiting acetylene gas plants.

## TO PROTECT PEDAL DESIGNS ALLIANCE AGAINST INFRINGERS

### Record Pedal Makers Unite With Metz of Waltham Company to Fight Imitators by Law.

It has been the sad experience of every manufacturer of pedals who obtained popular recognition of the merit of his goods, that his design was forthwith copied as closely as possible and worked into cheap material. Frequently it was only an outward resemblance that was aimed at and produced by the imitators, while the bearings and other features which would not attract the scrutiny of the average purchaser, were made in any fashion that would reduce the cost of production.

The slowness of legal procedure and the doubtful responsibility of the imitators made it a burdensome task for the originators of a design to protect their property, and the result has been that infringers have had free play and have flooded the market with pedals of apparently excellent design but which in use soon gave out and threw discredit

royalty or forced to abandon the offending form of manufacture.

#### The Protected Designs.

The fundamental patents controlled by the Record company are No. 548,042, issued October 15, 1895, to A. C. Davison of London, Eng., and assigned to Walter Measure of Needham, Mass., and No. 615,505, issued to Arthur Sidwell and also assigned to Walter Measure.

The claim allowed for the Davison patent reads as follows: "A pedal consist-

Fig. 3—The Metz Pedal.

ing of parallel supporting plates B, B, and parallel foot bars or plates A, A, arranged in planes across the ends of plates B, B, and projecting beyond the sides of the latter, with edge bearings for the foot, etc."; all as explained by the accompanying illustration, Fig. 1.

The Sidwell patent, illustrated by Fig. 2, carries two claims of which the second one is as follows: "A bicycle pedal comprising a supporting spindle adapted to be connected with the crank, a bearing hub supported on said spindle and provided with cross-arms at its inner and outer ends, and the treadpiece consisting of side bars and a crown or arch, all independent of the supporting bearings, the said side bars of the treadpiece being connected with the ends of the hub-arms one at each side of the hub and the crown or arch extending around the outer end of the hub and spindle in continuation of said side bars," etc.

The Metz patent, No. 546,071, of September 19, 1895, is illustrated in Fig. 3. The principal claim is for "arms extending laterally from the hub, and parallel footplates secured to the arms, the end portions of which form horns or stops extending beyond the length of the hub, of a shaft or spindle having a screw-threaded end and a wrench shoulder adjacent to the end, and a crank arm having a screw-threaded opening into which the threaded end of the shaft may be screwed."

#### Riders Considering Chainless Bicycles.

Philadelphia, Jan. 16.—The local cycling trade has been enjoying the beneficial effects of a fortnight of good riding weather, and already the first faint notes of the approaching spring trade have been heard in the many inquiries concerning new mounts for next season. That many of these inquirers have been endeavoring to solve the chainless question to their own satisfaction is regarded as an augury for good by the local dealers. As one of them remarked recently: "A chainless furor just at the present time would be a blessing for the 'Row.' Two years ago Arch street contained almost fifty bicycle establishments and the majority of them were making money. Now there are less than a dozen, and unless I'm greatly mistaken even this small number will be reduced unless there is an improvement in business. I believe such an improvement would be inaugurated by a good demand for chainless bicycles. My orders have been so placed that in event of a change in public sentiment from the chain machine to the chainless I will be prepared to profit by it."

Fig. 1—The Davison Pedal.

on the original patterns. This condition has become so intolerable in more than one line of manufacture, that the leaders whose goods were copied, have finally been brought to realize the need of some form of cooperation to reduce the evil. The plan which has found most favor involves an informal alliance between those whose interests are nearly identical, with sole reference to legal protection. In the pedal trade such an alliance has recently been formed between Charles H. Metz, the president of the Waltham Mfg. company, and the Record Pedal Mfg. company. Infringements of the pedals for which patents are owned by either of the contract-

Fig. 2—The Sidwell Pedal.

ing parties will hereafter be run to the ground with the combined financial resources of both parties and no effort will be spared to fine-comb the pedal manufacturing so thoroughly that all who have overlooked any of the points in construction or design for which the law allows protection under the patents referred to below, will be made to tender an offer of

## BRAZING BY IMMERSION

### Means for Controlling and Regulating the Heat Supply Through Suitable Furnace Construction

In the process of immersion brazing, one fundamental condition for successful operation is the ability of the operator for maintaining a large quantity of molten spelter at the proper heat throughout its mass. This condition depends chiefly upon the construction of the furnace.

The furnace must support a crucible which holds from 250 to 300 pounds of metal, and the arrangement of the fire box and the air blast must be such that no portion of the molten spelter will lose more heat, by radiation or absorption in the work, than may be steadily returned to it from the furnace. To this end the heat must be carried over the open top of the crucible in a steady stream, which will prevent cold air from chilling the surface of the spelter.

#### Flames Under and Over the Crucible.

Working on this idea, the designers of the original or "old style" Fulton furnace, illustrated in the last issue of the Cycle Age, placed the fire box at the bottom of the furnace and supported the crucible directly above it, the crucible being held by its end flanges on the walls of the furnace and also supported under its lowest point by brick buttresses projecting from the side walls. These brick projections did not come together, and so did not conflict with the fire box arrangement or divide the fire into two parts. Between the crucible and the side walls of the furnace enough space was left at each side for the heat to come up around the crucible and keep it heated at all points. A brick cover was laid on the furnace projecting inwardly from the side walls and reaching to the side edges of the crucible. This top, being a short distance above the crucible top, compelled the flames rising from the fire box and coming up at both sides of the crucible, upon reaching the top of the furnace, to turn inwardly and rush from both sides laterally across the top of the crucible.

#### The Cast Iron Jacket.

These primary principles in design and construction have been adhered to by the Fulton Machine Works in the new pattern of furnaces which are now being erected by them. The most noticeable change from the older style consists in entirely surrounding the fire brick walls with a cast iron jacket, such as is shown in the accompanying illustration. It comprises four plain plates of cast iron the two end pieces of which bear lugs for the swinging and latching of the cast iron fire box doors. The jacketed furnace presents a neat and complete appearance and keeps the fire brick walls from cracking and spreading under the action of the high heat to which they are constantly subjected. It economizes heat and saves repairs.

It being absolutely necessary that the fire may be maintained at any desired heat, the greatest possible convenience in attending the fire is highly desirable. It is conducive to better work and also saves money in other ways, for if the fire is kept clean from clinkers and the ash pit is not allowed to fill up, the iron grates will last much longer. Upon the care of the fire also depends the amount of coal burned. One dollar's worth of coal is sufficient for a day's work if the firing is properly done.

A capable fireman counts for a great deal and may reduce the coal expense

considerable, and may make one set of grates last a year and over, where another fireman would burn out a set of grates in a month. But a suitable fire box arrangement is also necessary, for the best fireman cannot save coal and grates and keep up a satisfactory fire in a poorly arranged firebox.

#### Description of the Firebox.

The Fulton firebox is simple. A door is placed above and another below the grate. By opening the upper door the operator may clean the fire from ashes and clinkers and replenish the supply of unburned coal. In cleaning the fire the only instrument used is an ordinary long poker. Through the lower door, opening into the ash pit, the ashes, which have been forced down through the grate at the times when the fire has been cleaned out, may be removed. In the original Fulton furnace the doors were placed only in one end of the furnace.

Iron Jacket and Draft Inlet Pipes for Latest Fulton Furnace.

In the new pattern a set of doors has been placed in each end, thus making it much easier for the fireman to reach all parts of the firebox with his poker. Further, there being doors in the front as well as the rear end, the operator may attend to his fire without walking around the furnace. To clean the ashes from the fire and put in new coal does not cool the furnace enough to cause the stoppage of brazing work more than a few minutes.

#### Distribution of the Air Draft.

The distribution of the air draft is a very important feature and one of those which have been changed in the new style Fulton furnace. The heat required in a brazing furnace demands a draft from the main pipe of about 500 cubic feet of air per minute under a pressure of 5 ounces. The regulating means should be in the main feed pipe, so that if part of the air is there cut off the reduction will affect all the firebox discharge pipes alike. In the original Fulton furnace the draft

inlet was placed at the front end of the feed pipe ends in a Y-connection at the back end of the furnace, a smaller pipe leading around to the center of each side. At each of these points another Y-joint is made, and from each Y a pipe runs directly to the firebox. There is thus an inlet air pipe near the end of each side of the fire—four pipes altogether, all of which discharge exactly the same amount of air at the same pressure. The turns in the air pipe have all been well rounded, so that there is no obstruction to the free passage of the air.

#### Arranged for Overhead Feed.

The pipes running to the furnace here illustrated are arranged for an overhead supply feed. The overhead supply is firebox. In the new furnace the main found most commonly in factories, but should the supply come along the floor instead of the ceiling, there would be a slight downward instead of a marked upward bend to the feeding tube, and the open joining end of the main pipe just in front of the first Y would fit to a horizontal floor pipe instead of a vertical pipe leading to the ceiling supply system.

The regulating check is simply a cut-off slide placed across the main pipe just in front of the first Y. In this furnace the proper brazing heat has been attained in about an hour's time in the

morning, and once attained no trouble has been experienced in keeping it throughout the day.

The points mentioned concerning the relation of the fire and crucible to each other, the support of the latter, and the arrangement of the air draft system are not only important for the proper maintenance of heat, but upon them depends to a large extent the amount of work which may be got out of one crucible. An ordinary commercial graphite crucible placed in a Fulton furnace has withstood regular all-day usage for over six weeks and has since been used off and on for six months. It is still in place and while nearly worn out is ready for duty.

#### Will Agree on Renting Prices.

The bicycle dealers of West Chester, Pa., are taking steps to combine and agree on a list of prices to be charged for the rental of machines.

### GERMANS' DESPERATE POLICY

Failing to obtain from the imperial government the prohibitory import duty on American bicycles which they have so earnestly and persistently demanded, the members of the Germany Bicycle Manufacturers' Association have decided upon a new plan for killing the American cycle trade in Germany. From this time forward they will unanimously refuse all credit to any dealer who handles, as part of his stock in trade, a bicycle of American origin.

Corroboration of the report according to which this vigorous and novel protective system is really being enacted by the German manufacturers has been received through the office of the American consul-general at Frankfort a. M., as related on another page of this paper.

Ordinarily Germans do not take very kindly to that which smacks of compulsion, and when, nevertheless, the German manufacturers have decided upon a policy which may cut both ways, and which it will require much commercial dexterity to follow without giving mortal offense to many of their customers, it is safe to conclude that they consider the situation so desperate that they must force the issue into the arena of a patriotic agitation. It is evidently their purpose to divide German cycle dealers into two distinct classes, one which carries German bicycles, with a possible addition of English and Belgian manufacture, and another which will refuse to yield to coercion and will carry American bicycles exclusively. Having effected this division, they may then endeavor to stigmatize the latter class as unpatriotic and unworthy of confidence, but it seems hardly probable that a movement of this character can have many chances for success in a country whose legislators have steadfastly refused to recede from the standpoint that the public are entitled to the greatest value for their money, from whatever source obtained.

On the other hand, there is perhaps in the situation a direct encouragement for our makers to canvass the German markets more thoroughly and more directly than formerly, so as to place before the German dealers a complete assortment of grades and prices in American bicycles and convince those among them who have heretofore kept only one grade of our manufacture in stock that they will be able to satisfy all their different classes of customers without yielding to the imperious edict of their home manufacturers.

### EQUIPMENT SELLS BICYCLES

The idea has been freely expressed lately in the camp of cycle accessory makers that the tendency of the present wholesale season runs to the extremes of grades and prices, and that saddles, lamps, tires, cyclometers, etc., whose makers aim to hold the middle ground, find buyers only outside of those circles where trade talk is current and up-to-date. Something similar to this has been said on previous occasions, however. There has always been a period in the beginning of each wholesale marketing season, when traders were so saturated with the opposing arguments of two opposite classes of sellers that they could see no room for trade between them. But as a rule the tendency in former years has been one-sided, with a preponderance in favor of cheap articles.

When this year the general opinion favors the higher grade article, the reason for the change is perhaps best explained by

reference to a new axiom which is working its way into the trade and which proclaims that "equipment sells the bicycle." This new doctrine, which has that in common with all other doctrines, that it is right or wrong accordingly as it is understood, might be expressed in several other ways. For example, it might be said, "construction does not sell bicycles, any more." That would be wrong, in so far as "construction" still has considerable to do to determine the buyer's mind—when wrong. But "construction" generally has lost in popular importance. It is now, from one point of view, second to "design." The market is tired of discussing cycle dynamics, while yet insisting that they must be right. It is not desired that the cycle manufacturer shall cease to discuss and justify his construction; on the contrary, he must continue to give mechanical descriptions, but he must not expect any comment, unless he is wide off the popular preference. In matters of construction, silence has come to be nearly equal to approval.

It is in this sense that "equipment sells bicycles," because it is taken for granted that "construction" is nearly right when nothing is said to the contrary. The thing to be demonstrated by the seller is now that the equipment has the proper value to justify the price asked for the bicycle; the rest will be allowed to pass on the reputation of the maker.

Nothing could be more natural under these circumstances than that the salesmen of accessories find their customers inclined to insist on one of two extremes. Either they will want the full benefit of an article of equipment the reputation and grade of which are strongly established, and will then be willing to sustain the price asked for such an article and support a high-class policy in regard to its sale, or they will exact the whole "pound of flesh" in the way of low prices if they conclude that their chance for selling goods by virtue of low price only is their best cue for profitable business.

At the present stage of the buying and selling activities these opposite standpoints are sharply marked and sharply noticed. Yet they are destined to be softened during the progress of the season. They are the standpoints of those whose minds are already made up and who have emphatic words at their command for expressing a decided bias in one direction or the other. But the great hesitating majority among the trade are yet to be heard from. They are not actuated by doctrines, are wary of extremes and travel in the middle of the road. They listen with natural sympathy—which leads to purchase—to the middle-ground arguments of those accessories manufacturers who make medium-priced articles. Such arguments do not read as brilliantly as those from the extreme camps of Simon-pure high-grade on one side, and of public-benefactor prices on the other, but they talk well and they wear well in the ever compromise-seeking estimation of the majority of the human race, viceroy the cycle riding public and the cycle selling retail trade.

There is no calamity threatening the manufacturers who cater to middle-price customers. There never is; for what the "middle-men" lack in brilliancy they make up through numerical predominance. Their goods are usually a little late in the market, and their customers are correspondingly late in purchasing. They have little to say for publication, but they "saw wood," and in the natural course of events they work out their own salvation with a sure-footedness that is somewhat exasperating to higher-prancing steeds.

For all that, the doctrine that "equipment sells bicycles" nevertheless has its significance for trade in the coming season, but a significance which is not a signal of danger to anybody except those who disregard it entirely.

### FOREIGN TRADE PROSPECTS

"There are many cycles to be made in the future, and by far the largest number of them must be made in the United States, the remainder being almost wholly divided between Germany and France, because England cannot be a successful competitor inside of twenty-five years to come."

This statement may read like mere "American bounce" in the estimation of many knowing ones on this side of the Atlantic, and will undoubtedly be received with derision in England, but, nevertheless, there is no lack of thrifty reasons for upholding the assertion.

Why cannot England compete with America in low cycle production cost? England has capital and managerial capacity

in abundance, and has been the acknowledged leader in all manufactures of metal ever since such manufactures became of importance in international commerce. Why, then, is England now to be suddenly taken out of the running in the cycle manufacturing contest?

Simply because the English workman has for generations been instructed, and has come to fully believe, that there is an economical limit to the extent of his individual production, and that if he exceeds this proper limit of individual production he does so at the expense of his fellow workman. This wholly absurd belief is formulated in the British workman's shibboleth: "A fair day's work for a fair day's pay."

Can a mere error of judgment, a simple failure on the part of the operative to grasp the true conception of industrial economics, make it impossible for a great nation to compete in an important manufacture?

If all the factory managers of England had a faulty conception of the fundamental conditions of economical production, then, very clearly, the English cycle maker would be at a disadvantage; but can it be possible that while the English cycle factory managers fully understand the situation, a mere mental misconception on the part of English workmen can force those managers to close their factory doors?

The convincing answer to this question is found in the fact that an American cycle plant cannot be made to yield the production with English workmen that it gives with American hands. Part of this failure in quantity of output is due to faults in form of material and quality of material furnished by English makers.

The English maker of bar steel, intended for use in automatic or semi-automatic tools, has not yet learned to furnish his product in sixty-fourth sizes, as do American makers; neither has he learned to make his bars perfectly round and of even size from end to end. Hence the English cycle parts maker is at a disadvantage with his automatics from the start, because his stock is not of the right outside form.

Again, our American tool makers know they must temper tools higher for foreign use than is needed for American use; this shows that the English makers of steel bars are not so certain of the constitution or treatment of metal as we are here, and as all users of rapid production machine tools well know, stock quality is the dominating cost factor in automatic tool product, and in fact fixes the price of all the operations in cycle making, from the drawing of the frame tubes to assembling the finished parts to form a completed cycle.

The cycle at present prices must be as nearly as possible a machine-tool product; hand work, in which the British workman delights and excels, is now out of the question. The parts must be perfectly machined, and must be to gauge before they go to the assemblers, to produce good cycles at a factory cost which will give the manufacturer a living when cycles sell to the user at present prices.

It is not, however, faulty stock alone which prevents the production of the cheap and good British cycle. It is the thoroughly ingrained conviction of the British workman that he is a good mechanic, as he often is, and that he can do a day's work in a day, as he often can, and last of all that if one workman doubles his day production, he takes the bread out of the mouth of some fellow workman, which makes it impossible for England to compete with America in cycle making.

Of what use is it to lay down the very best plant the world can produce, and then man it with workmen who will not exceed a rate of production which they themselves have fixed upon as "fair"? Absolutely none whatever.

Rapid cycle-part production by the use of machines involves the utmost limit of mechanical endurance, and unless the powers of the machine tools are supplemented by willing intelligence on the part of the machine tenders, no plant can give a good and low priced production.

The British workman prefers to starve rather than exceed a certain rate of production, often fixed in the secret councils of his "union," but just as disastrous to the manufacturer when fixed by the mulish workman's own estimate of "a fair day's work."

The English machine-tool maker also assumes an attitude which must be changed before England can ever again hope to rival America in light weight metal manufactures.

Modern machine tools have had two nativities, one British, one American—one owning such names as Whitworth, Maudsley, Bramah, Fairbairn, Nasmyth, and all the long illustrious line who laid the foundation of the heavy machine tool practice of the world, and the other a nameless nativity among the Connecticut clockmakers of the Naugatuck river, where our present automatic-machine tool practice originated. From the first the British tools were the best constructed in the world, and from the first the small Yankee tools excelled all others for production.

Now the time has come when these same ideas which made the Yankee "traps" so largely productive, and so "handy," have received appropriate embodiments at the hands of wholly competent designers, and have become thoroughly effective units of factory production, as durable as is compatible with high complexity of organization and extreme rapidity and low cost of production.

The British machine-tool maker still regards our American automatic and semi-automatic tools as "traps," and as a consequence the English tool shops have not produced any equivalent of our American tool-makers, a class of highly specialized artisans indispensable to low cost production of small metal pieces.

A whole generation will not more than suffice to produce in England tool-makers and automatic tool tenders equal in skill and adaptability to those of our ordinary American cycle shops. Hence it is perfectly certain that for a quarter of a century to come, at least, America can furnish English cycle users with cheaper and better bicycles than can be built in England.

\* \* \* \*

At the recent Chicago cycle show one of the noted features was the absolute absence of oil lamps and the prevalence of acetylene gas lamps. As nobody in the trade is prepared to believe that the oil lamp has been perfectly eclipsed, or, indeed, that there will not be sold at least equally as large a number of oil lamps as of gas lamps during this coming year, the failure to exhibit oil lamps has elicited considerable comment. It seems to be looked upon as a straw which shows how persistently the trade winds that blow at cycle shows fail to indicate the direction that actual trade will take.

\* \* \* \*

It also furnishes a hint to oil lamp makers to blow their horn, lest it may be generally supposed that the bright and steady gas flame has completely ousted the convenient kerosene from the affections of cyclists. The advantages of acetylene gas are too conspicuous to be concealed and the profits from the sale of gas lamps are too good in the aggregate to be slighted, but it may be doubted if there will be a sufficient number of really acceptable patterns of acetylene lamps in the market to afford satisfaction all around. It seems just possible that there will be a fine opportunity for pushing the sale of good oil lamps in districts where gas lamps of unsatisfactory construction first monopolize the attention.

## SPALDING DEFIES JOBBERS

### Complete Argument in Favor of Casting Off Jobbers and Selling to Retail Agents

Ever since the firm of A. G. Spalding & Bros. made public announcement of its intention to abandon the time-honored policy of selling to jobbers it has been the center of a storm which grew in fierceness as the jobbers rushed into print and sought to show that the new policy would end in disaster to its promoters. The Iron Age threw open its pages to all who cared to discuss the subject, and the acrimony and violence which some of its correspondents displayed in denouncing the Spalding plan of campaign, relieved occasionally by the vigor of some who held it to be justifiable, has resulted in a lengthy and masterly defense by A. G. Spalding, who if he does not effectually silence his critics at least defies them to do injury to his house or its trade.

The substance of Mr. Spalding's answer, as given in the Iron Age, is as follows:

#### Not Favoring Department Stores.

We are accused of favoring department stores in one city and giving up our entire wholesale and retail trade to a department store in that city, and that our goods could scarcely be found outside of department stores. We presume that this applies to our Philadelphia retail house, which we sold out last February to a prominent department store in Philadelphia, they buying the business, furniture and fixtures, taking our entire stock, assuming our lease, and the contracts and orders that our Philadelphia store had placed with our own factories. We decided that it was advisable to discontinue our retail business in Philadelphia and conduct our wholesale business in Philadelphia and vicinity from New York, and we happened to find a purchaser in one of the department stores there.

#### Department Stores Supplied by Jobbers.

Like all other manufacturers during the past three or four years we have been at a loss to know just how to handle so-called department stores. We have sold some of them under contracts and agreements that they would maintain our retail prices; in other cases we have refused to sell them because they cut our prices. And because of a disposition on the part of them to cut prices generally, we have refused to supply them with our goods; but none of them seems to have had any difficulty whatever in getting all of our goods that they wanted from certain jobbing customers who could not resist the temptation to supply them with what goods of ours they required because of the influence it had on the sale of some other articles of merchandise that the jobbers handled. Naturally the department store price cutters, finding that our system was so imperfect that they were able to get all of our goods they wanted, if not through us through the jobber, it rather tended to increase their desire to cut the retail prices of our goods still more.

#### Controlling Prices Made to Jobbers.

After these various experiences we began to study the question and finally came to the conclusion that, in order to control the prices of our goods at retail, it was absolutely essential that we control the source of supply from which the retail dealers secured their goods. We have always believed in the policy of handling our goods in such a way that the dealer could make a profit, but after several years of experience we have come to the conclusion that it is absolutely impossible for any manufacturer to control the retail price of his goods so long as he sells through the jobber; and, therefore, in order to carry out this theory and desire upon our part to establish retail prices and protect the retail dealer in the fair profit to which he is entitled, we found it was absolutely necessary for us to discontinue our trade relations with the jobbers.

#### Giving Up the Jobbing Trade.

Consequently, on November 21st last we wrote a formal letter to the 300 or 400 jobbers who had been handling our goods in the past, notifying them that on and after January 1, 1899, it would be impossible for us to supply any of our goods to jobbers for jobbing purposes at any price. This

means that we will positively refuse to fill an order from any jobbing house for jobbing purposes.

It might naturally be asked: "How are you going to prevent a jobber from buying goods for his retail department and then using them for wholesale purposes?" In reply to this will say that in making our arrangements with jobbing houses for goods for their retail department we propose to explain to them fully the conditions under which they receive our trade prices, and if they do wholesale the goods to retail dealers we shall simply cut off their supply and refuse to sell them any of our goods at any

#### Past Efforts to Protect Jobbers.

During the past twenty years we have done our best to try and perfect some plan by which we could protect the jobber in his profits, and I think, generally speaking, that our plan has been considered as successful as that of any manufacturer who has ever tried to do the same thing. Our plan of protecting the jobbers' profits and maintaining their prices to the retail trade was very successful until about four or five years ago, when the department store became a factor in the trade. Since then it has been more difficult every year to protect the jobber, not so much on account of his unwillingness to co-operate with us, but largely because of the conditions over which he had no control.

#### How Jobbers Cut Prices in 1898.

In laying out our policy for the last year, 1898, and at the urgent request of a number of our jobbing customers, we decided to remove all restrictions from the jobbers and follow in the wake of other manufacturers and let them sell our goods for what they pleased, always requesting, by the way, that they would maintain a price to the retail trade that would yield them a satisfactory profit. What was the result? Many of the leading jobbers at the commencement of the season not only threw away the small margin of profit that we allowed them, but in many instances sold the goods for considerably less than they paid us for them.

We did our best to maintain a price to the retail trade that would enable the jobbers to make a profit and we found ourselves in this delightful predicament. In sending our own travelers out representing bicycle sundries and other goods that the jobbers did not handle, we found no difficulty in selling them and getting good orders for them, but we found that we could not sell our own goods to the retail trade because jobbers had quoted prices on our leading articles at less than the jobbers had paid us.

#### General Dissatisfaction.

The jobber was dissatisfied because he could not make any money on our goods and was constantly hammering at us for lower prices, and not being able to get them he was constantly striving to get inferior, cheaper goods to substitute for ours, a very natural thing for him to do under the circumstances, for a jobber, like every other merchant, can't afford to sell goods without a profit. The retail dealer became dissatisfied because of the many different prices that were quoted to him on our goods and lost confidence and interest in them for the same reason.

All this tended to demoralize his profits, and he was selling our goods at cost or less to meet the cut price of some of his neighbors. Furthermore, the cut prices of the retail dealers carried conviction to the mind of the consumer that because of these cut prices the quality of our goods must necessarily have been degraded. The jobber was dissatisfied because he could not make any money on our goods, the retail dealer was dissatisfied because he could not make any money on our goods, and the consumer was dissatisfied because he thought the quality of our goods had been degraded; everybody dissatisfied except A. G. Spalding & Bros., who sold more goods and made a better net profit last year than at any time in their history.

#### Why the New Policy Was Adopted.

It will naturally be asked. If this worked so satisfactory to A. G. Spalding & Bros., why was a change made?

First.—Because we know the jobber cannot afford to and will not handle and push our goods if he cannot make a profit on them.

Second.—Because we know the retail dealer

cannot afford to and will not handle and push our goods if he cannot make a profit on them.

Third.—Because of the above two conditions we know self-preservation and self-interest will cause both the jobber and retailer to be constantly on the lookout for inferior unknown goods at lower prices on which he thinks he will make a profit (he won't, but he thinks he will), which will necessitate rival manufacturers cheapening their goods in every possible way in order to meet the demand of the trade for cheaper and constantly growing cheaper goods.

Fourth.—Because of these conditions A. G. Spalding & Bros. feel that the time will soon come, if it is not already here, when they will be forced to decide upon one of these two policies: (1) Either to constantly degrade the quality of their goods in order to meet the trade demand for constantly lower prices, and thus lose the reputation for a high standard of quality among the users of their goods that they have spent many years of hard work in building up, or (2) maintain the present high quality of Spaldings' trade-marked goods, which can only be done by establishing fixed selling prices based upon the cost of production. We have decided now on the latter course, and instead of waiting until circumstances and trade conditions may force us to decide upon the first named course. If this decision "busts" us, so let it be. We are confident that it will not, but we know if we adopted the first named course in time it surely would.

Fifth.—Manufacturing, as we do, every article bearing our trade mark, and having decided upon the policy of maintaining quality, the next question that naturally forces is decision is: How to reach the consumer at the lowest possible price to him. After much thought and mature deliberation we have decided this all important question to our own satisfaction, which in substance is as follows:

On and after January 1, 1899, A. G. Spalding & Bros. will reach the consumer direct from factory through the medium of the retail dealer, doing away with all intermediate jobbing profits, commissions to sales agents, special concessions, rebates, etc. Fixed prices to the consumer, based upon the cost of production, and no overcharging permitted. Fixed prices to the legitimate retail dealer, that will yield him a fair and sure profit, and no price cutting permitted. High quality maintained.

Sixth.—In order to successfully carry out these radical and apparently arbitrary methods, it is absolutely essential that A. G. Spalding & Bros. should control the source from which the retail dealer draws his supplies, and for that reason and for no other they have been obliged to discontinue supplying the jobber with any of Spaldings' trade marked goods for jobbing purposes.

#### Unanimously Approved By Agents.

Between December 1 and 10 our little red covered booklet, "A Radical Change," was mailed quite liberally to the retail trade throughout the country. Inclosed in this booklet was a return private postal card. Up to December 31 we had received 20,000 return postal cards from retail dealers, filled out in accordance with our requests, indicating the particular goods in our line in which the dealer was interested and handled. No catalogue with the new reduced prices was sent with it, and no effort was made to influence the opinion of dealers on the Spalding policy except in the matter contained in the booklet.

These replies give us no cause so far to regret having taken the retail dealers into partnership with us in the athletic and sporting goods business, and now, like good partners, we propose to take them into our confidence and tell them the truth, and we ask our numerous partners to do the same with us.

#### Retailers Should Get Together.

Manufacturers have their associations, and because of their small number, wealth and geographical locations it is not difficult for them to get together frequently and discuss matters pertaining to their own business and try and devise means by which they can correct abuses and make a better profit. Similar associations exist among jobbers, all trying to increase their profits and correct abuses in their particular department; but in all these conventions, conferences and banquets the interest of the retailer is seldom considered. It may be considered in a vague sort of way and pleasant addresses sent out to the retail dealer, but on account of his great numbers and lack of means to attend conventions held at distant points, and the further fact that as a rule he has to remain at home to attend to his own business, the retailers do not have their own conventions like the manufacturers and the jobbers, to consider matters for their own particular interests. If it were possible for the retail dealers to get together, compare notes and decide on a uniform policy that they would adopt for themselves and that they would like to have the manufacturers adopt, I am certain that

a very great majority of these retailers would be pleased, and if they could devise the power, would insist that manufacturers of well established goods go direct from the factory to the consumer through the medium of the retail dealer and maintain restricted prices at retail, cutting off such dealers as violated these conditions.

The responses that we have received in-dorsing the Spalding policy convince us that such a plan would meet with overwhelming favor by the retail dealer. As it seems impossible to get all the retail dealers in convention where these matters could be discussed among themselves, we have decided to try the experiment and find out for ourselves whether the retail dealers in athletic and sporting goods will co-operate with us in our honest efforts to make established retail prices to enable the retail dealer to make a fair profit and to prevent cutting on our goods.

#### Opposition to the Plan.

We have not asked any other manufacturer to join us. We are going it alone and we assure the retail dealer of the honesty of purpose back of this movement, and with the hearty and cordial co-operation and assistance of the retail dealers, we are confident of our position and success.

We realize that it is a big undertaking. Many manufacturers and jobbers are now laughing at us and insisting that it can't be done. We know it can be done and we are going to do it, and if we can have—as I am confident we will—the support of the retail merchants handling our class of goods, we don't care for the opinions of other manufacturers, who, we have reason to believe, are watching this so-called experiment with great interest, nor do we care what the jobber thinks about it.

We are assured that the 300 or 400 jobbers that are handling more or less sporting and athletic goods will try to circumvent us. We are sure that they will have in the aggregate some 4,000 or more traveling salesmen who will constantly be poisoning the minds of the retail dealers against us and our goods. We are assured that the advantages of the jobber in being able to ship goods by express or freight with a bill of lading, drugs or books will be of such consideration that we will not be able to reach the small dealer. It has been intimated that combinations will be formed against us, that manufacturers of competitive goods will receive the support and orders of the jobbers.

#### The Jobber Overestimates Himself.

We don't underestimate the advantages of the jobber, but, on the other hand, we think the jobber overestimates the control he has over the retail dealers of this country. Everybody knows that the present method of price cutting and lack of profits has not been satisfactory to the retail dealer, and we believe—and the Spalding policy is based on that ground—that our plan of giving to the retail dealer the very best prices that we want to give to any one, and our intention of giving him goods that will be cheaper in price and better in quality than can be supplied by any other manufacturer whose manufacturing facilities are not equal to ours, will be approved by the retail dealer and his co-operation and support accorded us. In addition to that we are giving the retail dealer standard goods in demand by the consumer, a demand created by the policy of 25 years in manufacturing the best quality goods, are protecting each article with our trade mark and our guarantee back of it, and at the same time are restricting the retail prices, thus enabling the retail dealer to make a satisfactory profit. Jobbers do not create a demand for any goods. They simply supply it, and are simply the middlemen or porters that carry the goods from the door of the factory to the door of the retail dealer, plus the jobbers' profit.

#### Creating a Demand.

There are three elements necessary to create a lasting demand for any article of merchandise.

First.—The manufacturer must make honest goods adapted for the purpose for which they are intended.

Second.—In order to acquaint the customer with this fact, and get the goods introduced and in use, he must be a liberal advertiser.

Third.—In order to make it convenient for the consumer to get the goods handily, without inconvenience to himself, the services and co-operation of the retail dealer are required. The Spalding policy contemplates the combination of these three elements; and going direct from the factory to the consumer, through the medium of the retail dealer, and eliminating the jobber, we believe will result in changing the present demoralized condition of the athletic and sporting goods trade, and will afford satisfaction to the consumer, who will be getting well known standard goods at fixed prices; will be satisfactory to the retail dealer, who will be able to make a fair profit because of the fixed retail prices; and

satisfactory to ourselves, who wish to perpetuate, and, if possible, increase our business. We do not go to the retail dealer with empty hands. We go to him with the two essential elements suggested above, and ask him to join us and make the necessary third element to produce success and satisfaction all round.

We appeal to the retail dealer with the same confidence of receiving his co-operation and support as Secretary of the Treasury Gage did when, ignoring the advice and opinion of many of the leading financiers whose selfish interests may have influenced their opinions, he went direct to the people of this country and asked for a loan to enable our government to carry on the Spanish war.

### BUFFALO REPAIRMEN THRIVING

Number of Shops Trebled in a Year—Mending Cheap Bicycles Kept them Busy.

Buffalo, Jan. 16.—The local repair business experienced a growth bordering on the phenomenal last year and where there were about sixty shops in the city at the opening of the season the number trebled before the end of the season and today the city is thickly dotted with repair shops. Mechanics who started in a very modest way the year before with scarcely work enough to make a livelihood found their quarters inadequate before the middle of 1898 and were obliged to secure more space and employ assistance.

This remarkable growth is largely attributed to the various cheap lines of bicycles with which this city was flooded at the beginning of the season.

Repairmen were sorely perplexed at times as to how to proceed with jobs that were brought them. So varied and difficult were they that hundreds of machines had to be sent back to the builders, if they could be located, which was a rather difficult task sometimes, many of them having gone out of business.

The greatest trouble experienced with this class of bicycle was the wretchedly bad brazing. To this imperfect work is traced nearly all of the trouble and accidents arising from the breaking of front forks which was epidemic here during the season. With very few exceptions there were no actual fractures. The entire trouble arose from the parting of the stem and crown. To all appearances the crown was simply shoved into the stem and the process of brazing hurried through with the utmost despatch and insufficient material. Not a pin was used in many cases and but very little brass appeared to have been used.

Two deaths and scores of painful and in several instances permanent injuries were the result of this kind of work, and public feeling was aroused to such a pitch that legislative action to protect the users of bicycles against faulty construction was demanded.

In the event of the reappearance of this trouble the coming season the makers and sellers of the machines at fault will be made subject to some restrictive and punitive law which will deal with this sort of workmanship in an extremely harsh manner, it is believed, for there are men who stand ready to introduce such a measure and force its passage.

#### How "Trading In" Works.

During the past season it became matter of frequent remark among riders that bicycles of the previous season were worth more to keep than to sell. When offered trade as part payment for a new machine, the allowance made by dealers was very small. Twenty dollars or \$25 was rare, and it was made only on strictly high-grade products in fine condition. More often only \$10 or \$15 allowance could be obtained, and most riders preferred to keep them to accepting that. This was the sad part of the situation from the rider's point of view. The dealers of such transactions had grievances of

their own. As a rule they had to sell the second-hand machines for less than they had allowed on them, and often they let them go for half as much rather than have them encumbering their stores. In connection with this state of affairs a dealer tells of a very neat trick that was played by a woman, according to a Pittsburgh paper. She bought a new bicycle and received an allowance of \$20 on her old one. After the bargain had been completed she asked the retailer what he would do with the old wheel. "Oh, sell it; and we're lucky if we get \$12 for it," he replied. The next day that second-hand machine was sold for \$12 cash to a young man who would not consider any other, and refused to pay more than \$12, although \$18 had been the original price demanded. It was not until some weeks later that the dealer learned that the young man was the brother to the woman who had turned in the machine. She had received a cash discount of \$8 in making her purchase and kept her old bicycle, which she afterwards sold to a friend for more than \$12.

### WIDE TIRES APPROVED

Professor Carpenter of Cornell University Demonstrates Advantage Over Small Tires.

Prof. Carpenter, in charge of the mechanical experiment station at Cornell, has completed a series of tests on the comparative value of large and small bicycle tires. In spite of the decided tendency in the past few seasons to diminish the size of their tires, Prof. Carpenter now shows conclusively that, other things being equal, the larger the tire the easier runs the wheel. This is particularly so in case the rider is of more than average weight.

It is not a matter of friction by contact with the ground, for, that being of the rolling type, amounts to practically nothing, but it depends on the loss of power in compressing the tire. On a two-inch tire the rider of average weight causes very little compression of the tire tread. The tire has a great bearing surface. Take half an inch from the diameter of the tube, however, and as it rolls along a constant indentation and release result. Here the power is lost, and hence the conclusion.

Prof. Carpenter says that a poor two-inch tire will run easier than the best one-and-a-half-inch tire that was ever made. A difference of over 15 per cent in the running qualities of a wheel is attributed to the kind of tire used. A single tube always proves faster than the double tube, but this may be due partly to the better material employed in making the former.

#### Death of Charles Daly.

Charles Daly, senior member of the firm of Schoverling, Daly & Gales, of New York City, died as a result of an apoplectic stroke on January 11 at his home in Summit, N. J. Mr. Daly began his business career with the old firm of Tufts & Colley about 1858, and subsequently was connected with Sargent & Co. and H. Boker & Co., which latter firm he left in 1865 to join Mr. Schoverling in the gun business. He was one of the incorporators and for many years president of the Marlin Fire Arms Co., of New Haven, Conn. He was one of the organizers of the Hardware Club. A son and a daughter survive him.

#### Heavy Overproduction in Germany.

It is said that the German cycle market is overstocked to the extent of 175,000 bicycles. "The outlook," says a leading German newspaper, "is most distressing. This year's sales will be most calamitously affected."

## EXPRESS COMPANIES WEAKEN

### Leading Officials Counsel a Policy of Concession, but the Controlling Spirits Are Firm

The aggressive manner in which the Merchants' Association of New York is carrying on its war against the express companies is said to have resulted in a temporary truce, during the course of which high officials of the carrying companies earnestly advocated a policy of concession in order to allay the inflamed commercial interests and put an end to expensive litigation, arising out of the construction variously put upon the affixing of stamps to bills of lading. But with that stubbornness for which they are famed, and that haughty indifference to the rights of the public for which they are held in disfavor, the controlling spirits among the carriers decided to let matters run their course. As a consequence the association is more active than ever in waging war and in seventeen states is making preparations for compelling by legislation the reforms which it is apparent can never be secured by more pacific agitation. Following are some late expressions of opinion from the retail cycle trade upon the subject of controversy:

#### Old Excuse Does Not Apply Now.

Decidedly I am in favor of the movement and will do all I can to help it along. For years I received all my bicycles by express; now I order all by freight and find that from Chicago to Mitchell the time is only one day longer than by express. I believe the express companies simply tuck on all the traffic will bear. By express it used to cost \$1.35 to \$1.50, but after I had twenty-five or thirty bicycles come by freight one bicycle came by express contrary to my orders to the manufacturer, and I noticed the rate had fallen to \$1.25. The local express rates are too high, also. One of my customers wrote me from White Lake, S. D., that it cost him 50 cents on a single bicycle wheel with the tire from Mitchell to White Lake, a distance of thirty-six miles. When bicycles were worth \$150 each the express companies said the reason the rates were so high was because the goods were so valuable that if one was injured it cost heavily to pay the damages. The prices are down now and I do not see why the carrying rates stay up unless it is because the companies can get their price. The railroad companies charged from 10 to 15 cents too much on each machine until I went to weighing the wheels before crating. I received rebate from the railroad company for all overcharging that I could prove. I hope this movement will be successful.

Mitchell, S. D.

L. E. STAIR.

#### Despotic Rates in the West.

It has always seemed a little despotic that we are compelled to pay \$3 to get one bicycle here from Chicago by express, whereas it costs an agent in New York (same distance) \$1 per machine. This could have been changed to a certain extent had bicycle manufacturers shown a disposition to make an allowance for excess western rates in upholding their theory of "treating all agents on equal terms." This excess charge comes out of our commission on goods sold. My opinion has always been that the bicycle manufacturers by a joint action could have secured a special rate on bicycles. There are also a great many other things that manufacturers could do for the benefit of their agents and patrons, one of the worst practices being the compelling of a man to pay express on his broken or defective parts and tires after he has once paid the market price on guaranteed (?) goods. We patronize freight if possible.

Colorado Springs Col

L. C. WAHL.

#### Express Charges Triple Cost of Goods.

We are certainly in sympathy with any legitimate movement whereby the express companies can be compelled to moderate their charges. We are compelled to use express more and more every year, and are willing and expect to pay for quick service, but we do seriously object to being robbed,

and that is what it amounts to out here where there is no competitive line. The charges on most goods are enormous, the express charges being in a great many cases three or four times as much as the first cost of the goods. Two or three houses have helped us out by prepaying charges, they being able to secure better rates, or at least it costs them less at their end of the line. We believe the fast freight would be all right, but think that something should be done to compel the express companies to make reasonable charges.

Devil's Lake, N. D.

C. P. BRAINARD.

#### Railroads Should Perfect their Service.

We have not been able to pay the exorbitant express rates charged out here for two years. We use fast freight entirely, and will continue to do so until a more reasonable charge is made by the express companies. Our freight service is nearly as prompt as the express and if the railroad companies would make a lower or less than 100-pound rate on small packages they would get every pound of our business. We are in sympathy with any movement that will educate the people as to the folly of using express where freight service can be had. The railroad companies should be encouraged to perfect this service, giving us rates on small packages, and the merchants will do the rest. A solution of this question is undoubtedly coming. The express companies must reduce their charges or the United States government should give us safe transportation of larger packages through the mails.

Denver, Col.

FELKER CYCLE CO.

#### At Mercy of Two or More Companies.

I most certainly am in hearty sympathy with the movement to compel the express companies to moderate their charges for the carrying of goods, particularly small packages. The fast freight plan seems to be one good solution of this evil that the retail merchants have to deal with. I have one particular complaint to make; that is, against the transfer charges which the western express companies make when goods are carried by two or more express companies. I wish this movement success.

Sandy Hill, N. Y.

L. E. SEXTON.

#### Risk Decreased but Charges Stationary.

The proposal to use fast freight meets with our approval. We feel very bitter toward the express companies for evading the tax; also for their very excessive charges for small packages, and because the tariff is the same now on a \$25 bicycle as it was on a \$150 bicycle, although the risk to them is six times less as far as damages are concerned. We sincerely hope the day is not far distant when their excessive charge will be lowered by fast freight, postal package delivery or something else, and it will surely come soon. The distant rumblings caused by evading the stamp tax will surely end in a striking of the lightning.

Arkansas City, Ark.

H. S. SIMMONS.

#### Rates Higher than Cost of Goods.

I am certainly in favor of the movement started and will do all I can to further it. Express rates to Denver from any point east of Chicago average \$5 per 100 pounds on large articles, and on small ones very often several times the value of goods. I use freight or mail whenever possible and shall continue to do so and never ship by express except when compelled to do so. Hope you will win.

Denver, Col.

E. T. WEIANT.

#### Freight Economical and Satisfactory.

More than twelve months ago I worked faithfully towards a reduction of these extortionate express charges on bicycles. Today the charges are the same on these goods that now retail at \$35 as they were a few years ago when they sold at \$150, with the difference that the express companies now carry fifty packages to the one of five years ago. After a voluminous correspondence I was informed that the companies could not discriminate in favor of our goods as against hats and millinery goods covered by the same rates. I was further assured that a movement was then on foot for a general revision of express tariffs, looking to a material reduction, but this promise has resulted in nothing. From the

attitude of the express companies on the stamp question, I saw no hope for a reduction, therefore, I say we must look for relief in fast freight. Personally I have no grievance on this score, as I handle machines manufactured in Chicago, and our freight service between Chicago and Memphis does not differ four hours from that of the express company. This applies only to one road, for I find sometimes that my positive directions are overlooked and goods shipped by other roads and their connections means anywhere from eight to twelve days in place of thirty-six hours in transit. Express rates from this point to Chicago per 100 pounds is 3 cents per pound; less than 100 pounds the rate is higher. Freight on bicycles is \$1.27½ per 100, considerably less than one-half, which resulted the past year in the saving of a neat little sum. The express companies have a very arbitrary rule. Bicycle parts must be crated, no matter of how little value. There may be small danger of breakage or injury in transit, but if not crated the rate is double first class. It simply means express charges on useless crating material and labor to the shipper to crate.

Memphis, Tenn.

CHAS J. SCHERER.

#### Express Companies Absorb All Profits.

I am in sympathy with the movement started in New York. I prefer fast freight. Express charges are too heavy, especially in the west. Our profits are all paid to the express company.

Ogden, Utah.

L. H. BEECRAFT.

#### Express Rates Higher than Postage.

We think the fast freight proposition would be a great thing. As for us, we get the largest part of our wheels and bicycle sundries, also guns and gun material, by express and have often noticed that the company has charged us more for small packages than the mail would have been from any part of the United States, and often these packages have only come 250 to 500 miles. We do not see why the fast freight could not be run on all railroads to good advantage to both small dealers and to the railroad companies also.

OKLAHOMA CYCLE & SUPPLY CO.

Oklahoma City, O. T.

#### Railroads Could Give Good Service.

I think the subject of lower transportation rates by express companies a timely one. I am a thorough believer in fair and reasonable charges for all articles of commerce and all individual or public service. While express charges in many cases are not exorbitant, there are cases in which the charges are far beyond the limit of reasonableness. The suggestion of organizing a fast freight service is, I think, a good one. I think the railroad companies are the only ones which should profit by the transportation of the goods they handle. Certainly such a service would be safe enough for goods of ordinary value, and goods could be transported in reasonable time if the long delays at stations could be eliminated. As to complaints, I once paid 70 cents to an agent of an express company for bringing a package containing a two-ounce bottle of lubricating oil a distance of 300 miles. I have received bicycles which were marked correctly to go by a direct route, which, when only twenty-five miles from their destination, were shipped by a roundabout way 200 miles more with increased charges. Surely these instances are enough to show what some express companies are capable of, and all who have occasion to ship or receive goods should welcome a reasonable and honorable service. Your efforts to bring about a change for the better should be appreciated.

Orient Point, Suffolk, N. Y.

R. W. TUTHILL.

#### Freight Better for Short Hauls.

During the past season I have avoided using the express companies as much as possible. Their charges are out of all reason and since they have compelled us to pay their revenue tax I have found the ordinary freight better for short carries, but dislike to put the shipper of small packages to the trouble of forwarding by freight lines. I have never been able to recover anything damaged or lost by the express companies, but have found the freight lines reasonable and ready to adjust all claims. Any movement that will compel the express companies to make their charges reasonable will be good for the well-being of all business.

Ashaway, R. I.

H. HERBERT KENYON.

#### Fast Freight Found Satisfactory.

I am surely in sympathy with any movement to compel express companies to moderate their charges. I frequently use fast freight from New York and find it quite as satisfactory as express, but am not sure that to use it universally would be satisfactory; however, I believe it could be made so. I have had several special complaints to make concerning express companies but

Auburn, N. Y.

EDWARD LEONARD.

#### Even Slow Freight Better than Costly Express.

Fast freight would meet my approval, and sometimes slow freight would, too. I have no other complaint against express companies than their extortionate charges.

Sodus Center, N. Y.

R. S. BORRADAILE.

#### Always Ship By Express.

We always have our bicycles shipped by freight.

Redwood Falls, Minn.

DALLAS E. LAIRD.

#### Has Stopped Using Express.

I for one have stopped all use of the express facilities except at most urgent need, using the mail instead where I can and freight for all other goods. In fact, they would have to quit if their patrons were all like me.

Vermillion, S. D.

D. W. C. NICHOLS.

#### Compelled to Use Freight.

We are situated so far from the centers of production that we have to pay an average of \$4 on a bicycle, which obliges us to get all our wheels by freight, and then we have to order in quantities to enable us to have some in stock, as it takes about three weeks to get machines by freight. Push it along.

San Antonio, Tex.

WAGNER & CHABOT.

#### Shipping by Freight this Season.

Express charges have been so high with us that we have been forced to make our shipments so far this season by freight and shall continue to do so.

Datonia, Fla.

HALIFAX CYCLE CO.

#### Freight Almost as High as Express.

The proposal to use fast freight instead of express meets with our approval. We hope arrangements can be made to cheapen transportation. The railroads have been charging almost as much as express companies. Both carriers are at fault; for instance, the express company delivers one bicycle from New York city for \$1.50, while the railroad charges \$1.10 on same, but takes five days longer to deliver.

Charlotte, S. C.

FITZSIMONS & CO.

#### Used Fast Freight for Two Years.

If the express companies do not give us the rate we ask, we believe in having the fast freight used as much as possible, which we have done for two years.

Arcanum, O.

A. F. SHULER & SON.

#### Prefer Express at Lower Rates.

We were very much interested in the recent article in the Cycle Age but we have no specific complaints to make. We are in favor of the fast freight proposal, and think it is quite generally used by the dealers here, especially those representing Chicago made wheels. However, this is not as satisfactory as express, and we are in sympathy with anything that will tend to bring express charges down.

Memphis, Tenn.

PRITCHARD, EVANS & CO.

#### Good Railroad Service at Low Cost.

Two years ago we were requested by the Western Wheel Works to have as many of our wheels shipped by freight as we could, and we took their advice. Since that time the express company has handled very few wheels for us as we get about the same service from the railroad company as we did from the express company at from one-fourth to one-fifth the cost.

New Egypt, N. J.

CHAPEY & BROWN.

#### Saved \$200 by a Late Change.

Last season we received over 400 wheels, nearly all by express. We shipped a few late in the season by fast freight and had we shipped all by fast freight we could have saved at least \$200. The wheels are handled carefully and the time is only eight hours slower than express.

Washington, D. C.

ACME REPAIR BICYCLE CO.

#### Wants to See a Change.

I am with you in the movement with both hands and approve of the fast freight instead of the express. The express companies' charges are too high for crated wheels and small articles, and very often breakage which can be found out only after goods are delivered cost a loss to the buyer and a delay of time. The express company here will not carry any small package or repaired bicycle parts unless they are prepaid, which often adds to the cost of the goods, and there is no way of getting a rebate

back. By all means I would like to see some change and do away with the express companies' overcharges.

Plattsburg, N. Y.

A. LANGLOIS.

#### Finds Freight Service Satisfactory.

We are heartily in favor of any movement that will have a tendency to cheapen the express rates that now exist. The proposal to use fast freight meets our approval; in fact, we are now using the freight routes as much as possible and find the service satisfactory. We have had some trouble with the company receiving two packages at the other end of the line from the same party (which could not easily be tied together) under the same receipt, and when delivered to us the company charged the same as if they had been received from two different parties and shipped out under separate bills. In many cases the express cost almost as much as the article shipped. We have watched carefully as to the express charges and find that the charges on all parts received except crated wheels will average between 20 and 25 per cent of the invoiced price of the shipment. Our express items foot up to quite a sum in a busy season and anything that we can do to lessen this expense will be done.

Rome, Ga.

WEST CYCLE CO.

#### Lower Rates Would Help Dealers.

Regarding the express companies I have no special kick, only the high rates charged for transportation. I think it would be a great help to dealers if they were lowered.

Bradley, S. D.

R. T. READ.

#### Cheaper to Send Collect than Prepaid.

I am very much in favor of what the merchants are trying to do in New York. It seems strange, but our agent here in town says that if we prepay goods the express will be more than if sent collect. A while ago I sent two crated bicycles to New York city, prepaid, for \$1, and when they came back I only had to pay 70 cents.

East Hampton, N. Y.

E. B. MUCHMORF.

#### Wholesale Thieving in Florida.

In no other state in the Union are the people robbed by the express and railroad companies as in Florida. I am heartily in sympathy with your movement and will give all the aid in my power to stop the wholesale thieving.

Tampa, Fla.

TAMPA CYCLE CO.

#### Excessive Rates Prohibitory.

We have not been able to use express for two years. Charges too high for profits on wheels.

El Paso, Texas.

EL PASO CYCLE CO.

#### Would Like to See Rates Lowered.

Express comes high and I would like to see rates cheapened if it can be done and let the expressman make a fair profit.

Omaha, Neb.

MIDLAND CYCLE CO.

#### In Sympathy with Whole Movement.

I am in favor of the New York movement to compel these carriers to moderate their charges, and to use fast freight.

Tyndall, S. D.

J. C. KIEHLBAUGH.

#### Cheap Rates by Boat.

For the past year we have been having our machines shipped to Boston and then to Baltimore by steamer at an average charge of 29 cents per machine as against \$1.10 each by the express companies, the difference in time being three days in favor of the express companies. We would cheerfully pay 100 per cent increase in the rates we are now paying to get goods by express, but draw the line when the increase is 300 per cent.

Baltimore, Md.

E. D. LOANE JR., CO.

#### No Alternative but Freight.

We had little to complain of in Providence until one express company squeezed out the other. Since then rates have gone up and there is no recourse but freight, which would be satisfactory if faster.

Providence, R. I.

CORP BROS.

#### Ships by Local Express Company.

We are most heartily in sympathy with the movement started in New York. We have had trouble with the American Express Company in our town and have made use of a local company wherever possible, but could not do this with business beyond Boston, Mass. Reckon us in on any move that shows the least hope of bringing them to terms.

Portsmouth, N. H.

F. B. PARSHLEY & CO.

#### Advocates Parcels Post.

We are fully in sympathy with the agitation to regulate this matter. In our experience with the express company here

(and they have a perfect monopoly) we have always found them a "law unto themselves" and it is next to impossible to get any satisfaction for any grievance, however real. We would like to see established a parcels post similar to that in successful operation in England for the last fifteen years.

Bridgeport, Conn.

BRIDGEPORT CYCLE CO.

#### Monopolistic Charges.

Express charges to this place are simply outrageous. I have paid sometimes as high as 50 to 75 per cent of the cost of the package. At Fulton, N. Y., the rates are about one-half less because there is competition. Heavy packages we send by stage to Fulton for 10 cents and get about half rates there.

Mexico, N. Y.

H. H. DOBSON.

#### Special Rates on Large Business.

I think the express companies' charges to some places are very high. I will lend my best assistance to put a stop to it. Would use freight in many cases. Think special rates should be allowed between factory and agents doing a large business.

Amsterdam, N. Y.

ED. T. DEGRAFF.

#### A Big Factor in the Trade.

A Big Factor in the Business.

I think the proposal to use fast freight is a good one. Express charges are quite a factor in trade at the present low prices of bicycles. I wish you great success in your undertaking and will give what little help I can.

Hudson N. Y.

WILLIAM PETRY.

#### Finds Freight Cheap and Fast.

I have been using Erie fast freight for the past season with the best results. A little more than a year ago the express company succeeded in suppressing all competition in Hartford and proceeded to advance rates; with me the charges on a single wheel advanced from 90 cents to \$1.35, and at the same time the time increased a day. I began experimenting with the different fast freight lines and found that I could get a rate of 40 cents a machine and only one hour longer time required than the present express time, by the E. & N. E. Despatch. As a result the advance of rates cost the company all the business I had previously given it on complete bicycles.

Corning, N. Y.

F. C. WILLIAMS.

#### Drawback to Freight System.

We could not use fast freight as goods are not delivered, and for this reason we prefer the express system. We have only one specific complaint to make against our express company, and that is their practice of making their patrons pay for the revenue stamps on express packages when the law was intended to tax the companies and not their patrons.

Watertown, N. Y.

CARPENTER & MALF.

#### Volume of Business Warrants Lower Rates.

Considering the extensive business done by the various express companies in the shipment of bicycles, I certainly think their charges are away above what they should be. I am heartily in favor of any movement which would bring about the reduction of their rates. I am not in favor of fast freight except in long-distance shipping.

Sing Sing, N. Y.

GEORGE OSTENDORF.

#### Small Buyers Suffer Most.

I think the present express rates on small packages are too high. When small dealers cannot order from the factory direct in quantities, it works a hardship on them on account of the express charges which take all the profits and in many cases more. I have given up the idea of expressing goods and have been ordering all goods sent by freight, and will continue to do so unless I can do better. The fast freight would be all right, I think.

Woodburn, Ore.

E. L. REMINGTON.

#### Thoroughly Tired of Abuses.

We are in sympathy with the movement started in New York to compel these carriers to moderate their charges. The proposal to use fast freight meets with our approval. Our complaints are too numerous to mention.

San Antonio, Texas.

FRANCE & THIELE.

#### Californians Would Use Freight.

The proposal to use fast freight instead of express meets with our approval. The prices of the express companies are too high.

Pasadena, Cal.

FD. R. BRALEY & CO.

#### Rates to the South Invisible.

We never think of using the express company for shipping bicycles as the charges are "out of sight."

El Paso, Texas.

W. G. WALZ CO.

#### Will Patronize Fast Freight.

We are in sympathy with you in your move to compel the express companies to reduce

# Stearns Bicycles

## Twelve Magnificent Models

—go to make up the Stearns product for 1899—a product that, in point of variety, elegance and perfect work in every detail, we believe to be without a peer in the world.

❀❀❀ The STEARNS CUSHION FRAME, Models K and L, mark a new era in bicycle construction. The cushion device adds from 2 to 2½ inches to the resiliency of the present pneumatic tired wheel, without loss of strength or durability to the frame or changing its graceful lines. It assists the pneumatic tire in making riding easier. They are ideal wheels for comfort for both men and women.

The STEARNS SPECIAL, LADIES' SPECIAL, 30-INCH SPECIAL and TRACK RACER show a degree of excellence never before attained in the history of bicycle making. ❀❀

The STEARNS MODELS E and F will be the favorite road wheels of the season. The extreme lightness, the pleasing lines, the narrow tread and the many technical improvements are irresistible attractions. ❀❀

The STEARNS CHAINLESS, MODELS G and H, combine the practical features of the bevel gear mechanism with the alluring charms peculiar to Stearns construction.

❀❀❀ The STEARNS TANDEM, diamond and combination frames, are entirely new models.

With so extensive a line of praiseworthy wheels we are confident that the dealer who handles them cannot fail to meet with success. ❀❀

The Yellow Fellow Year Book is now ready. We invite correspondence ❀❀

**E. C. STEARNS & Co.**  
SYRACUSE, N. Y.

The trade on the Pacific Coast supplied from our branch store, E. C. Stearns & Co., 210 McAllister Street, San Francisco.

their charges, and will be one to patronize fast freight instead of the express. We approve of the fight you are making against them and hope to see the extortionate charges reduced at an early day.  
Alexandria, Tenn. ROY & JONES.

**Meanness of the Monopolists.**

I consider the express charges from the east to the Pacific coast excessive, and think the express companies should be compelled to pay the war tax and not raise the charges to get even.  
Marysville, Cal. F. D. GORDON

**Big Profits the Strongest Argument.**

I consider the rates charged by express companies most arbitrary, especially on small packages. There is no classification and a package occupying one cubic foot of space may cost more than one occupying five, simply because it weighs more, etc. I use freight when possible, and have never failed to get bicycles from Reading, Pa., to Lockport in three days. Have had machines come from Waltham, Mass., in three and four days, at a cost of from 25 to 33 per cent. of express charges. If the figures relating to the profits of the express companies published by the shippers' association are true, I think there is very little remaining to be said in favor of reduced rates.  
Lockport, N. Y. F. S. COATES.

**Advise a General Request for Reduced Rates.**

The proposal to use fast freight instead of express so fully meets with my approval that I have been using it for over a year. I have noticed in other lines an inclination to grant a reasonable request, where any attempt to force the same party to make the same concession would be met with stubborn resistance. Certain lines of merchandise, such as printed matter, oysters, bread, etc., are granted special rates by the express companies, and it would seem that a general request by those interested (agents, makers or any one having occasion to ship or receive shipments of bicycles or accessories) should and would receive prompt and favorable attention from the companies and special rates be named. I have already asked the agents of the various companies represented in our city to take up at once with their traffic managers the matter of special rates on bicycles and sundries, and would suggest that all dealers and others interested take similar action at once. This will indicate to the authorities that there is a general and earnest desire for the special rates, and the same request from thousands of patrons would certainly impress the companies more than one from a committee, no matter how many representatives it might have. I favor making known our desire to the companies, and giving them a fair chance to make reasonable concessions voluntarily, before trying to force them.  
Dubuque, Iowa. C A NOYES.

**Shippers Should Organize.**

The proposition of fast freight meets with my views, and can, I think, be made a success if the shippers throughout the country will only organize with that end in view.  
Sacramento, Cal. F. M. JONES.

**Argument for Parcels Post.**

The remedy for high express charges is lower postal rates for packages under 10 pounds and fast freight for crated bicycles or large shipments of sundries. The government can afford to carry merchandise at 4 cents per pound and make a profit if it can carry periodicals and magazines (which are really three-fourths advertising circulars) at 1 cent per pound. The express companies will meet competition, of course. Freight charges on crated bicycles are \$6 per hundred weight, and express \$12, so we poor coast dealers suffer either way. The time required from Chicago by express is five days, and by freight ten days; these are minimum. The San Francisco Board of Trade is fighting the stamp charge, but California courts are so notoriously slow that we have no relief as yet.  
Hollister, Cal. THE LOGAN CYCLE CO.

**Charges Never Twice Alike.**

Not only myself but all the merchants I have spoken to on the subject in this country say that the express companies never have the same charge on the same article coming from the same place. The expressage is more from the west than from the east. I think that fast freight would be O. K. for this section, and I will do all I can for it.  
Boise, Idaho. J. B. TAYLOR.

**Western Business Lost to Manufacturers.**

We would like to use the express companies but cannot as their rates are too high, being out of all proportion to freight. The time is about six or seven days shorter than the freight time in reaching this point from Chicago. The freight rate from Chicago to this point on bicycles is \$6 per 100 pounds in less than car lots, and the expressage is \$12 per 100. The railroad companies stand in with the jobbers to force the retailers to buy

from jobbers here. They place the rates at \$2.40 in car lots, which means that if one can not buy 400 bicycles at one time at an outlay of \$10,000 to \$15,000 and \$480 additional for freight (as they weigh about 50 pounds each crated), he must in taking a smaller number at one time must pay \$1,200 freight for the same amount, or \$2,400 expressage.  
Portland, Ore. DALY & HIGLEY.

**All Charges Out of Proportion to Risk.**

For the past two years we have used fast freight instead of express as much as possible, but find that even the freight companies charge an excessive rate considering the small value of bicycles now and the small margin the dealer gets after paying express or freight. As far as we know there has been no reduction in freight or express rates since bicycles used to sell for \$125 to \$150 and we believe it is high time that both express and freight rates were reduced.  
Wichita, Kan. M. H. BURT CYCLE MFG. CO.

**Have Stopped Shipping by Express.**

We have practically abandoned all shipment by express except in extreme cases. In several cases we have paid more for express charges than the goods were worth, and have had charges vary 20 per cent for same distance and weight. The position taken by The Cycle Age is certainly commendable and should receive the hearty cooperation of dealers and tradesmen in general.  
Austin, Minn. HARRIMAN MFG. CO.

**Good Business for the Express Companies.**

The proposal to use fast freight instead of express meets our approval in a general way. Two days ago we had to pay 75 cents for a 7½-pound package from Chicago. The bill for the goods was but \$1.61. This is all right—for the express company.  
Frederick, Md. KEYSER & CO.

**Wants Lower Freight Rates on Small Packages.**

I most heartily sympathize, from the point of a fellow sufferer, with all business men who are imposed on by the transportation companies with their extortionate charges, but I must confess that as a rule I have suffered most on freight charges for packages weighing less than 100 pounds. If I can be assured that by combined efforts we can have our freight charges regulated so that we can ship fractional portions of 100 pounds at only a small charge for handling the extra packages, say, a rate of about 20 per cent more on packages under 50 pounds, then I vote for fast freight.  
Paris, Tex. ERLE K. BAKER.

**Lower Rates Would Increase Business.**

Situated as we are so far from the manufacturing and jobbing centers, we feel the heavy tariffs much more than dealers who are not so far away. We have just made an effort to secure a freight rate on a car of bicycles for shipment to El Paso, but find that we cannot get any lower rate on a carload than on a shipment of 100—either from Kenosha, Wis., or Chicago. We are of the opinion that it would be a good business move on the part of the express companies as well as a benefit to the dealers to reduce the express rates to the minimum, as if the rates were low the express companies would handle the bulk of bicycle shipments except when carloads are shipped, and this should increase their revenues much more than the increase in expense, but possibly they do not make a correct estimate of the increased business low rates would bring them.  
El Paso, Tex. MCCUTCHEON, PAYNE & CO.

**Express Companies Need a Heroic Dose.**

I think that fast freight would be good medicine for the express companies.  
Wilton, N. H. P. J. ABB TT.

**Weary of the Injustice.**

We are charged rates varying from \$1.75 to \$2.25 on bicycles of the same make from Dayton, O. This is very unsatisfactory. We trust that you will be able to do something  
Savannah, Ga. R. D. & WM. LATTIMORE.

**Prefers Express At Reduced Rates.**

We are in hearty sympathy with any movement that will compel express companies to moderate express charges. Unless this can be done, we will advocate fast freight, but inasmuch as express companies deliver all goods at our doors, we would prefer getting goods through them if charges can be lowered. Oftentimes the express on a bicycle lamp, bicycle parts, etc., is as much as cost of the article. We trust that your efforts will be rewarded and appreciated by the retail merchants.  
Aurora, Ill. HENRY RYAN.

**Assets Shrunk by Instalment Sales.**

In the schedule of assets and liabilities of the Sol Heyman company of New York

city, which went into bankruptcy some time ago, the total liabilities are shown to be \$154,172, with nominal assets of \$44,812 and actual assets of \$24,327. The direct liabilities are \$45,506, and contingent liabilities \$108,666, of which \$99,816 are unpaid leases of the stores which the company occupies. The difference between the nominal and actual value of the assets is on account of depreciation in stock and outstanding accounts for goods sold on installments.

**Cycling Increasing in the South.**

The bicycle is steadily gaining in favor in the south and Charleston, S. C., has probably more riders in proportion to the white population than any other city in the country. There are 30,000 white inhabitants and there are 7,000 cyclists. Four years ago there were hardly fifty riders. More women ride than men. One third of the streets of the city are asphalted and there is a shell road ten miles long running out through the woods from which bicycle paths branch off in all directions. These paths are made by the riders themselves, whose pneumatic tires pack the sand down as hard and smooth as a board. The real riding season is on down there now and more cyclists are to be seen at this time of the year than in summer.

**Exports of Bicycles and Materials.**

Exports of bicycles and bicycle material from the port of New York for the week ending January 10 are recorded as follows:

	Bicycles.	Material.
England .....	\$20,046	\$10,756
Canada .....	.....	26,653
Argentina .....	13,281	100
Holland .....	1,683	4,919
Germany .....	2,221	5,057
France .....	6,813	1,590
British East Indies .....	5,313	249
Denmark .....	439	4,007
British Africa .....	3,865	34
Belgium .....	65	3,925
Russia .....	117	1,808
Sweden .....	100	1,728
Brazil .....	1,032	83
British Guiana .....	356	586
Uruguay .....	915	.....
British West Indies .....	750	166
Prussia .....	47	625
China .....	609	34
Australia .....	400	75
Norway .....	342	.....
Portugal .....	71	209
United States of Colombia..	188	80

Venezuela .....	85	.....
Central America .....	70	10
Italy .....	70	9,174
Hong Kong .....	36	.....
Arabia .....	55	.....
Other countries .....	44	16
Totals .....	\$59,232	\$63,036

**Eleven Months' Exports to Germany.**

That the apprehensions of the German makers are not vain or imaginary is made plain by glancing at the appended table of American cycle exports—all kinds of goods implied—for eleven months of the past year, which are put in comparison with similar periods for 1897 and 1896:

	1896.	1897.	1898.
	\$216,202	\$1,147,776	\$1,411,961

**Restoring Looks of Shopworn Tires.**

The following inquiry upon an interesting subject has been received from a dealer in Colwich, Kan.:

Editor Cycle Age: Will you kindly inform me through your paper, if there is a way to renew the appearance of tires of wheels left over from last year, slightly soiled? I have tried washing them but this will take the outer coat of gray off and leave black spots.

The Cycle Age is unable to furnish the desired information. Those who may possess it are requested to communicate it.

## COMMERCE IN FOREIGN MARKETS

### CYCLING IN SOUTH AFRICA

Cycling has developed at an astonishing rate in South Africa during the past six years and is now the most popular past-time. Interest has been awakened through racing on the track, and now the public has taken it up with an enthusiasm which bespeaks a bright future for the bicycle in that quarter of the southern hemisphere. There are seven tracks in South Africa, located at Cape Town, Port Elizabeth, Kimberley, Johannesburg, Durban, Maritzburg and Grahamstown. The track at Cape Town, which has not long been completed, cost \$50,000, the amount being provided by the city; while the authorities at Port Elizabeth have expended no less than \$20,000 on their track and ground, and the Kimberley track was completed eighteen months ago at a cost of \$35,000. Touring clubs are starting at all the principal centers, one of the best being the Johannesburg Cycle Touring Club.

### TRADE CONDITIONS IN TURKEY

The activity in industries and trade throughout Turkey is marked and unmistakable. Germany continues to show energy in every department of business, and is undoubtedly taking each year a part of the business given heretofore to England, Austria, and France. There is a general impression in business circles that the German manufacturers are giving credit upon such long time and to dealers of such doubtful responsibility that they will soon believe that commerce with this country is not desirable. The English, who have heretofore done the bulk of the importing business, are making no special effort to extend their business, and they seem to be relying upon the reputation they have gained for selling reliable goods. Germany, on the other hand, has already acquired the reputation of manufacturing cheap and comparatively worthless products. The goods of American and English manufacture are the only ones which have an unquestioned reputation for quality. This reputation has led the Germans to manufacture and market imitations of American and English goods.

Much has been written and said of the long terms of credit given by German and Austrian manufacturers to the retail dealers of Turkey, and it has been contended that the conservative ideas of American manufacturers, the large percentage of irresponsible dealers in Turkey, and the difficulty in enforcing collections render the markets there uninviting to American trade. The conditions complained of are partly real and partly fictitious. They are not unlike conditions in the various states of America, except that a somewhat longer credit is given in Turkey; but the tendency is decidedly toward cash or shorter credits. Nearly all the American goods entering the Turkish market are sold for cash or upon very short time. In many cases, a remittance or deposit is required at the time the order is given. Long credit is not given by any manufacturers to dealers in Turkey, unless their responsibility is unquestioned.

As to the difficulty of collecting debts, there is no more trouble or delay in collecting debts in Turkey than there is in the United States. As nearly all the merchants in Turkey are Greeks, Italians, English, Germans, Austrians, and French, a resort to the Turkish courts is scarcely ever necessary. The creditor must sue

the debtor before the latter's consul, and he is usually a man of such high sense of integrity that he will not shield a debtor, unless he is able to make a substantial defense upon the merits of the case. Moreover, the consular courts are always open, the proceedings are summary, and there is less delay than in any courts of the United States, except the courts of inferior and limited jurisdiction, like the justices' courts of the state of New York.

### WRETCHED ROADS IN CUBA

The presence of a few bicycle salesmen in Cuba and Puerto Rico does not imply an immediate demand from those markets. In fact considerable time will elapse before they add materially to the volume of our exports. No money has been spent on the roads of Cuba, all of which are in a deplorable condition. Attention should at once be given to this important question and a liberal sum out of both local and general revenues of the island set apart for this purpose.

The colonial methods of Great Britain are receiving careful study by members of the administration who have anything to do with the government of the new dependencies. There is still a strong desire for the creation of a new department having charge of all matters relating to the new dependencies. This will probably be recommended to congress at the next session. The experiment is being made in Cuba of an independent colonial service.

### CYCLE TRADE CONDITIONS IN HONG KONG

To thoroughly understand the Hong Kong cycle market it is necessary to describe the highway conditions of the colony. Hong Kong is built on the side of a mountain 1,800 feet high, and all streets above sea level are terraces broken by flights of steps, making the majority of them unavailable for cycling. Consequently, the available roads are reduced to two, although there are numerous excursions that the daring rider can take throughout the island. The favorite, and in fact only, road for ladies borders the harbor front and is about 8 miles long. This road has a hard, metaled surface and is beautifully kept. The view and scenery along it is unrivaled, and the breeze that comes sweeping in from the ocean is most refreshing. Every evening from 5 until 7 it is alive with cyclists with the most heterogeneous lot of machines ever seen. Bicycles of all dates run side by side. The other road referred to is called the Aberdeen road, which is also 8 miles long. This road contains some heavy grades which a strong rider can take, but they do not commend themselves to the majority.

Hong Kong is a free port; consequently, custom-house duties do not have to be considered in the purchase of bicycles or bicycle parts. There are no real importers of bicycles. There are two small bicycle repair shops which always keep a few machines on sale. On the other hand, every firm, from the largest to the smallest, handles bicycles for the convenience of customers, who are scattered all over China and the Philippine Islands. Possibly half of those which are in use here were purchased by their owners direct from San Francisco, and probably two-thirds of all the machines in use here are American. There is no favorite make. There has been very little money spent in advertising any particular make. The Chinese, who are becoming the largest

users of bicycles on this coast, are utterly indifferent to name or reputation.

What this market demands is a low-priced machine—one that would sell for, say, \$20 gold in America wholesale. If there is added, say, \$3.50 freight from New York to Hong Kong, the machine could be sold at a nice profit. The high grades of American machines are at present selling in Hong Kong for \$185 Mexican, and where one could be sold at this price, one hundred at the cheaper figure would find a market. It is not necessary that the machine should even be of a late model. The 1896 make would command just as good a price as the 1899. China is a magnificent field for bicycle manufacturers to unload all their old stock. All bicycles should be fitted with brakes, lamps, and bells, as the streets are crowded with rickshaws and sedan chairs, and darkness comes on almost without waning.

Since the occupation of Manila by the Americans, there has been something of a boom in the bicycle trade, as Hong Kong has for years been the feeder for the Philippine Islands, as well as its warehouse. In time, of course, agencies will be opened in Manila for bicycles; but until that time arrives, Hong Kong will be the distributing center.

Bicycle makers should not sell indiscriminately to the unknown individual purchaser on credit, as there are no collection agencies. The same conditions exist with regard to bicycles as to all other shipments, the shipper drawing for his shipment and negotiating his draft through a bank, with complete documents attached.

### SENDING CATALOGUES TO GERMANY

An avalanche of circulars and catalogues, printed in English, are sent to Germany annually; they can not be read and are therefore consigned to the "basket." Circulars should be printed in German, and good German from both grammatical and technical standpoints. Some which are sent from the United States are not only unintelligible, but ridiculous. Illustrations of the machine or article should be given, with full description of its construction, operation, advantages, range of work, and application. Net and gross weights should be given in kilograms and not in pounds, and dimensions in meters and centimeters. The price should be given free on board ship at New York, Boston, Philadelphia, or Baltimore. Many circulars give prices at some inland city, and the cost of transportation to the seaboard is often greater than the freight charges from New York to Bremen or Hamburg. Shippers should secure bills of lading from the ship, if sight draft is made with bill of lading attached. Sight drafts are frequently made upon a bill of lading issued by the railroad company at the original point of shipment, and, as the consignee does not know the American seaport from which the property started, he is unable to form any idea as to when he will receive the goods and can not trace them in cases of detention, which are frequent.

Four years ago there were not one hundred bicycles in the city of Rheims, France. Now they are coming into more general use, and workmen are commencing to use them. There are a number of machines of American make. These have been introduced generally by houses having headquarters in Paris. Many more can be sold. The roads are fine.

## SUBJECTS OF GENERAL INTEREST

**CITY STREETS OF THE FUTURE** What will the streets of large cities be like when the motor vehicle comes into use? This is a question which interests greatly all students of electricity and civil engineering, and any one who talks much with them will be likely at first thought to reach the conclusion that they are extremely visionary in their views. Whether they are visionary or not, their descriptions of possible developments are interesting.

The first result of the final passing of the horse will be the elimination of stone pavements. Some engineers think it not improbable that before many years iron may, because of its cheaper quality, take the place of asphalt. With no iron shoes of horses and no iron tires to come in contact with it, there are no obvious objections to be made to its use. It could be cleaned as easily as asphalt, and it might be so constructed as to make the effects of heat and cold upon it comparatively unimportant. With smooth pavements everywhere, over which horseless vehicles can move with ease and rapidity, an extraordinary transformation of street locomotion becomes possible.

But the greatest gain of all from the departure of the horse will be in cleanliness. When he goes the larger part of the work of the street cleaners will have come to an end. The cleaning of the roadbeds will be a simple matter and can be done almost entirely by flushing them from the water mains. The same electricity which gives us the motor vehicles will give us in steadily increasing measure better lighting of our streets and houses and better heating as well. Even the bicycle may rise in public favor as a result of good pavements.

**THE DREAD OF LARGE BANKS** In many large cities there is just now taking place a perfectly natural and wholesome consolidation of banks. The movement is slow; the banks participating in it, or those which are absorbed into others, are failing to make money, or are making very small profits, so that reason for the consolidation is perfectly plain. With a decreasing rate of interest larger capitals have to be employed in order to meet the fixed charges of bank management and afford a reasonable profit, while in the investment of funds, a bank or trust company with \$6,000,000 of capital has decided advantages over sixty banks of \$100,000 capital each.

As to the effect of large banks upon popular sentiment, it is quite certain that popular sentiment is not going to be more hostile to aggregations of capital, and, on the contrary, that this relic of barbarism, the fear of banks, is destined to recede before advancing enlightenment.

As to branch banking, there are many communities in the west and south that cannot adequately support independent banks, even of small capitals. It costs a certain amount to run even a small bank. A small capital does not afford profit enough, and there is not employment enough for a large capital. In cases where these small communities do support banks they do it only by means of high rates of interest, made still higher by charges and commissions which are the cost of the local community. In a purely agricultural community the obstacle to banking is that, in the spring, all the bank's customers want to borrow and none make deposits; in the fall all are depositors and none are borrowers.

The branch bank meets most or all of these difficulties. A branch is more cheaply run than an independent bank. It can be maintained, therefore, where the independent bank cannot be. In the fall it can take all the deposits offered because the parent bank, or some other of its branches, can find use for such funds. The country branch can accommodate all its customers in the spring, because its resources are not limited to its local deposits; it can obtain funds from the parent bank. Under a system of branch banking experience shows that there is far less difference than in the United States between the rates of interest in the great monetary centers, and those in the agricultural communities. The great obstacle to branch banking is the ignorant suspicion and opposition of farmers in the newer or poorer states, and yet of all classes of the community no other one would be nearly so much benefited by branch banks as the agriculturists, who would find the rate of interest drop nearly to the rates in New York and Boston, instead of remaining at the high figures due to the local stringency of credit.

Much of the opposition to legislation permitting branch banks undoubtedly comes from the small local banks that have little competition and are able to get very high rates for the use of their funds.

**ELECTRIC RAILWAY ENGINES** A noted electrician contends that in the next fifteen years, unless there should be an unexpected slump in electrical progress, steam will be superseded by electricity as the motive power for even the trunk-line railroads. The change will mean the reduction in time between New York and Chicago to ten hours, and a general readjustment of business and social conditions to a standard of 125 miles per hour instead of 40. This revolution will come without any great sacrifice in railroad properties and without radical departure from present methods of railroad construction.

The chief difficulty in the way of this great revolution is the waste which conservative railroad men always point out that it would bring to the enormous railroad plants already in operation. In the matter of locomotives alone there are now 30,000 steam engines in the United States in service, and if they only cost \$10,000 each it would mean that some \$300,000,000 worth of machinery would have to be sold as scrap-iron, as they could probably not be adapted to electrical service. It has been estimated that the cost of installation of an electrical plant—conductors, locomotives, motors, and cars—for a single railroad system such as the Pennsylvania would reach \$100,000,000.

It would be much more feasible than some railroad men think to change the plant. Running over an inventory of the items in a steam railroad property of today he finds a great number of the asset of a sort which would not have to be changed—real estate, office and terminal buildings, stations, round and car houses, repair shops, road-bed and appurtenances for its control and protection, passenger and freight car bodies, car-trucks, and many of the locomotives. All mentioned here, except the car-trucks and locomotives and the general repair shops devoted to locomotive work, would continue in uninterrupted use.

This electrician then takes the case of

a railroad running by steam and goes into the details of the cost of changing it. He suggests that as fast as a steam freight locomotive should become superannuated—and the life of such a machine is just so many years—an electric locomotive should be substituted, and thus in time the whole equipment would be changed.

Aside from the enormous advantage of greater speed, there are obvious economies in fuel and repairs. Five pounds of coal in a steam locomotive are now required to do what one and a half pounds will do in a stationary plant. The cost of fuel per horse-power per hour would be brought down to a half cent, and if gas engines were used to still less. The cost of repairs would be enormously reduced, in spite of the greater speed obtained. Track life would lengthen with the gradual elimination of the locomotive, and repairs to a motor are both less costly and less troublesome than to a locomotive. The electric motor runs without intermission, requires little attention, and gives an output far in excess of that demanded of any other machine in hard service. While it may not be asserted that electrical apparatus is invulnerable or that the mighty power which we drive through devious ways finds its pathway always free from obstruction, it is true that correctly designed and well-made electric railroad apparatus is of lasting utility.

**REMARKABLE FOREIGN TRADE** The story of the foreign commerce of 1898 is now complete. Its exports are the largest in our history, its imports the smallest since 1885, although the consuming population is now 33 per cent greater than at that time. As if to emphasize the great work of this greatest year, the month of December made for itself the highest record of exports ever made by any month in our history. The total exports of December were \$137,247,448, and of the full calendar year \$1,254,925,169. Only two earlier calendar years crossed the billion dollar line, that of 1897 having been \$1,099,709,045, and 1896 \$1,005,857,241. The largest record of any month prior to that just ended was that of November 1898, which was \$129,780,014, while only sixteen months in our history ever crossed the one hundred million dollar line in exports.

The imports of the year are as notable as the exports, but for reverse reasons, being the smallest since 1885, although the consuming population is, as above indicated, greater than at that time. They amount to only \$633,664,634, as against \$742,623,893 in 1897. Thus the year shows an increase of more than 150 million dollars in exports and a decrease of more than 100 million dollars in imports, giving by far the largest excess of exports ever known in our commerce.

The total excess of exports of merchandise is \$621,260,535, against \$57,090,914 in 1897, which was the highest record prior to 1898.

It is said that there are about 45,000 bicycles in Denver. The small builder does a thriving business. There are about 125 repair and machine shops where bicycles are built. One concern made 1,200 multiple and single machines.

A partner has authority to execute a chattel mortgage of firm property to secure a firm note, without the knowledge of his copartner.

Get Your Money's Worth

\*\*\* IN A \*\*\*

# Patee Crest.

PATEE CREST, \$35.00.

**Warranted the Best Bicycle in the World for the Money.**

A good, live agent, who is not in business for to-day only, will investigate the merits of this machine before closing a contract for his '99 leader. It always pays a dealer to give his customers their money's worth, whether there is a big profit to him or not. The margin on the Patee Crest is small, but it is "honest money" and a fair compensation, while you can sell three Patee Crests to one of any make, that pays a larger profit. Does this interest you? If it does, drop us a card for agents' prices and a copy of our circular, "Opinions from 100 of the best retail agents in America." Up-to-date dealers don't wait until their neighbors secure all the good lines. They write to-day.

**PATEE BICYCLE CO., = Peoria, Ill.**

## RECENT PATENTS

### Device for Centering Stock in Lathe—Boltless Seat Post Binder—Folding Mud Guard

**Center Indicator.**—The object of the instrument is to aid one of the most common difficulties in lathe work, that of centering chucked turning stock. The instrument is hung from an arm adjustably fastened to the cross slide of the lathe. The clamp for this attachment may grip the cutting tool. The forward end of the hanger or yoke is divided and has at the end of each arm a cross journal. These cross journals hold a ring which is pivoted on a vertical axis and made to be tightened against swinging by a thumb screw. At right angles to the axis of the ring another axial line is formed by two pivot points which support a ball. The ball thus constitutes a universal joint which may swing in both vertical and horizontal planes. The ball is equipped with a collar-like projection which clamps a long rod or bar passing through the horizontal center of the ball. If the instrument is to be used for determining when a chucked bar is exactly centered with relation to the lathe spindle the rod point at the universal joint end is placed in the depressed center point in the chucked piece and the center at the long free end of the bar is held on the tail stock center of the lathe. The thumb screw holding the ring at the universal joint is loosened so that the joint may swing freely in both directions. As the chucked piece revolves the eccentricity of its center will cause the adjacent end

of the rod to revolve accordingly and the long end of the rod will revolve in a magnified path. As soon as the machinist by manipulating the chuck brings the center of the work truly to the spindle axial line the rod will cease revolving and remain still in a straight line. It is not necessary, though best, that the ball at the universal joint be set exactly coincident with the axial line of the lathe spindles. When the tool is to be used for centering a chucked annular piece or other work which has a central hole the head end of the rod is supplied with a conical headed thimble and the ring is secured by the thumb screw against movement, thus limiting the motion of the rod to an up and down swing. The conical thimble is permitted to rest against the upper peripheral wall of the hole in the piece to be centered. The counter-poising weight of the long arm of the rod keeps the thimble up to its bearing at the top of the hole and as long as the work remains untrue the eccentricity of the wall of the hole will cause the rod to vibrate in a vertical plane. As soon as the hole becomes concentric the vibrations will cease. The inventor is C. P. Fay, Chicopee, Mass., assignor to the J. Stevens Tool & Arms Co., same place.

**Seat Post Clamp.**—The clamp, which is that used on Tribune bicycles, consists of but two pieces. The interior of the seat cluster lug is bored out about three-sixteenths of an inch larger than the diame-

ter of the seat post and is internally screw threaded at the top. Near the bottom of the lug a shoulder projects so that below this point the post is hugged snugly. Surrounding the post and resting on the shoulder in the cluster lug is a short

piece of tubing with its ends cut obliquely so that the rear lower edge touches the shoulder while the front upper edge touches an actuating nut which is screwed down into the lug. This tube should fit around the post snugly but lies loosely in the cluster lug. When the nut is screwed down the pressure on the upper front edge of the binding tube causes this tube to press against the seat post in two places—at the upper rear edge and lower front edge. The pressure of the nut will also cause the comparatively thin walls of the tube to give so that the cross section will assume an ovoid shape and the tube will bind on the sides of the seat post as well as at the front and rear. Upon the unscrewing of the nut the binding tube will spring back to its normal position leaving the post loosened for adjustment or removal. A small pin projecting inwardly from the lower rear side of the cluster lug and engaging a notch or hole in the binding tube keeps the latter from turning. The inventor is L. B. Gaylor, Erie, Pa.

**Folding Mud Guard.**—The guard is composed of flexible material, such as sheet rubber, which may be wound on a small cylinder, reel fashion. This reel is secured to a frame which is mounted on the rear stays of the bicycle frame directly

above the rear wheel. The outer end of the flexible strip is secured to the end of a folding frame comprising crossed and jointed slats like the extension frame used by dentists for supporting an electric drill. The end of this frame is secured to rods which swing on clamping pieces secured lower down on the stay

tubes. When it is desired to extend the guard over the rear tire the latch on the reel ratchet is lifted with one hand and with the other the rider grasps the hook at the end of the guard and pulls it out, the folding frame extending itself correspondingly. The brace rods compel the extended guard to conform to the curvature of the rear wheel. To fold up the guard it is simply necessary to wind up the reel. The whole when folded occupies a space equal to about four cubic inches on the back of the stays. The inventor is R. A. M. Herman, New York.

**Screw Machine Attachment.**—The device is for the purpose of turning tapers or irregular forms upon a screw machine automatically. The cutting tool is held in a box mill which is cut away at its head to provide for the reception of the working stock and the cutting tool. The stock passes through a hole in the end of the cut away portion nearest the chuck of the machine. The cutting tool is fastened by means of a set screw in a block which slides in a transverse slot in the mill head. The shank of the tool extends backward beyond the outline of the box mill, and is restrained in its sliding movement by a spring acting between the box mill and the head of the shank. A pin depending from the lower side of the tool block touches the edge of an adjustable forming guide secured by set screws to the cross slide of the lathe. The box mill is held in the machine by its spindle and as the latter is fed along toward the chuck the cutting tool must follow the contour of the forming guide

on the cross slide, as the spring at all times keeps the depending pin against the edge of this guide. By varying the form of the guide any irregular or taper form may be turned without attention from the operator other than that ordinarily necessary in the operation of a screw machine. The inventor is J. P. Brophy of Cleveland, assignor to the Cleveland Machine Screw Co., same place.

**Back Pedaling Brake.**—The front sprocket is secured to the axle by means of a ball ratchet device so that it will rotate forwardly in unison with the axle, but will run free when the motion of the pedals is reversed. Around the central part of the crank axle is a similar ball ratchet, though reversed in the direction of its operation. This ratchet actuates a collar which carries a cam acting at one end against a limiting pin placed in the hanger bracket, and at the other end against the forward extremity of a horizontal plunger brake rod. When the rider back pedals the internal ratchet catches the collar and turns it with its cam backward, so that the brake rod is pushed toward the rear wheel where an

ordinary spoon brake shoe acts on the tire. A coil spring around the brake rod returns the brake to its normal position

after the rider has ceased to back pedal and has returned to the regular forward pedaling. The inventor is V. E. Doremus, of New York.

**Sprocket Design.**—The principal feature of the design lies in the heart-shaped opens cut in the sprocket plate. This cut-

ting gives spokes wide at their intersection with the hub, narrow at their centers and wide and divided where they join the rim. The design is granted to J. F. Fanning, Chicago.

**Handle Bar Adjustment.**—Working upon the assumption that riders desire to

adjust their handle bars by raising or lowering them in the fork stem, this inventor provides a spring for the auto-

matic raising of the bars when the binding screw has been loosened. The handle bar stem is splined to match feathers on the interior wall of the fork stem and is supported on a spiral spring resting on a partition across the fork stem, so all that is necessary when it is desired to raise the bars is to loosen the binding nut. The spring does the rest. A small spring-operated headed pin is held in a box on the opposite side of the fork stem when the handle bar stem is raised sufficiently slips into a depression in the bar stem. This locking arrangement serves the purpose of limiting the action of the stem-raising spring and preventing it from throwing the bars entirely out of the machine. A modification of the locking pin provides for a beveled end and a beveled engaging depression so that the pin may be pushed out of its locked position by simply pressing down on the handle bars. The inventor is Carl Ehling, Bremen, Germany.

J. A. Reed, Morvin, Ala., is the patentee of a changeable gear driving mechanism comprising two sets of chains and sprockets, one placed on either side of the machine. Both front sprockets run loosely on the crank axle, being mounted on ball bearings. There are on the outer side of each sprocket clutch teeth which may engage corresponding clutches arranged to slide along the axle. An arm extends upward from each of these slidable clutches and the two arms are connected at their upper ends by a cross rod passing above the sprockets. The cross bar is further supported by two stationary arms projecting from the hanger bracket. A lever is pivoted to a lug about midway up the lower tube of the bicycle frame and is secured at its lower end to the cross bar. The upper end of the lever rests in one of the notches in a catch piece secured to the frame tube. By lifting the free end of the lever from the catch and swinging it one way or the other, one clutch piece is freed from its adjacent sprocket and the other made to engage with the clutch teeth on its sprocket. Thus either the high or the low gear sprocket may be made to turn with the crank shaft and drive the bicycle.

Alvin M. Cushing of Springfield, Mass., is impressed with the idea that the only proper way to brake a bicycle is to use the same method as that common among tobogganers, that of pressing a rod into the ground while the machine is in motion, thereby retarding its movement. He consequently gives his impression form in an invention which comprises a hand lever swung from the lower frame bar near the head and reaching a short distance above the top frame bar. Midway of this swinging handpiece is attached a rod which extends obliquely back past the hanger, where it is guided and controlled by a spring. The lower end of this rod is in close proximity to the ground. When the rider desires to operate the brake he pulls back on the hand lever, thus lowering the long rod until it touches and drags on the ground. A simpler scheme for accomplishing the same result is that employed by some of the riders in the hilly portions of Pennsylvania, who, when they approach a descent which is too steep to coast safely, get off and cut down a small sapling or shrub and, tying it to the rear of the frame, drag it after them down the hill.

J. J. Harden, Chicago, is the patentee of a cushion tire in which resiliency is suppositiously obtained by constructing the inner surface of the tire in the form of a series of longitudinal ridges with V-shaped recesses separating them. The tire is detachable and is held on the rim by flanges at the edges which fit into cor-

responding grooves around the sides of the rim. When the tire is in place on the rim the ridges press close to each other, narrowing the sectional area of the V depressions. When any pressure is brought to bear on the face of the tire the ridges immediately underneath will separate, this ease of separation making the tire flexible. At the same time the tire at other places than where the pressure is applied becomes more stable than normally.

Without tendering the public any exact information concerning the intended usefulness of the invention, K. G. Hiller, Zittau, Germany, patents a canvas cover for inner tubes, this cover to be removable from the outer casing with the tube. It is made in several sections, the ends of which lap each other so that in case of puncture some one section can be pushed back, freeing the rubber surface of the tube sufficiently to allow the repair of the puncture to be made. Whether this casing is supposed to act as the sole retaining jacket of the tire or whether it is to be used on an inner tube fitted into an ordinary casing already supplied with a canvas jacket is not stated by the patentee.

### SEGMENTAL DRIVING GEARS

Designed to Transform Rotary Into Reciprocating Motion for Driving a Bicycle.

The transformation of a continuous rotary motion into a reciprocating movement and the application of the latter to the driving of bicycles is accomplished by J. T. Pederson of New York City by the use of a set of segmental gears and a pair of swinging slotted levers arranged as shown in the illustration.

On the crank axle are secured two half

gears placed side by side with the toothed parts opposite each other. Hung from an axle supported by a light frame projecting from the seat mast are two segmental gears, each having the proper number of teeth to remain in mesh with its corresponding gear on the crank axle for a period equal to one half of a revolution of the latter. Supported above the rear fork tube near the rear end of the frame is an axle from which are pivoted two slotted levers that engage pins on the ends of diametrically opposite cranks attached to the axle of a spur gear driving a pinion that in turn drives a gear on the axle of the rear wheel of the bicycle. Connecting rods join the slotted levers and the segmental gears above the crank hanger. When the teeth of one of the crank axle half pinions are engaging the end teeth of its segmental gear just before separating, the teeth of the other pinion will be engaging the end teeth of the other segmental gear preparatory to giving it a motion equal in duration to a half turn of the crank axle. It will be noticed that in consequence of the gear wheel at the back of the frame moving in the direction indicated by the arrow, the two connecting rods will for the moment move in the same direction. Both sectional gears then move in the same direction as the sectional pinions upon the crank shaft, but the movement in this direction of one of the connecting rods

ceases as soon as its gear passes entirely out of engagement with the driving pinion and is carried in the opposite direction by the movement of the slotted lever, which movement is governed by the cranks attached to the axle of the spur gear driven by the levers. The teeth of the forward sectional gears and pinions are not subjected to heavy concussions or strains which would cause unusual wear because the driving strain is gradually transferred from one gear to the other while the gears are both moving in the same direction as the sectional pinions on the crank shaft.

While the gearing is well designed and combines mechanical principles which are strictly practical, it has the common shortcoming of having more open and unprotected working parts than popular ideas of bicycle mechanisms could tolerate. The gearing is too bulky to be comfortably housed in a gear case, weighs too much to be well liked for use on bicycles, and adds at least an inch to the width of the lower frame of the bicycle and to the tread of the cranks. A better application would be to the slide valve mechanism of a steam engine.

#### To Make Automotive Trucks.

Joseph Leiter has announced that within a week a company will be organized for the operation of auto-trucks in Chicago. The first installment manufactured will be 2,000. The trucks will be operated with compressed air motors and will be built in Chicago. The International Air Power company, which proposes to furnish the motive power for the auto-trucks and compressed air motors in New York and Chicago, was recently incorporated. The capital stock is \$7,000,000. The incorporators are Robert McKenstry, Joseph H. Hoadley, William Knight, Harry Knight of New York, and Edwin F. Glenn of Philadelphia. Mr. Leiter's name does not appear among the incorporators. He, however, owns or controls a majority of the stock. A similar company, known as the New York Auto-Truck company, was also incorporated last Saturday with an authorized capital of \$1,000,000. Richard Croker is at its head. Interested with him are Nathan Straus, Lewis Dixon, Arthur P. Gorman, Joseph H. Hoadley, and Robert McKenstry.

#### German Motor Vehicle Movement.

Every reputable bicycle making concern in Germany is busying itself in motor vehicle construction. Many firms are further ahead in their appreciation of the motorcar than English makers. They have watched French progress carefully, and the moment they touched the point of overproduction in cycles they were prepared to turn to the new work.

#### Motor Vehicles at French Show.

There were 386 stands at the recent French cycle and motor vehicle show held in Paris. Motor vehicles were exhibited in 89 of these, bicycles in 87, tires in 35, motors, materials and tools for automobiles in 20, sporting goods, cycle clothing, etc., in 28, and bicycle parts and sundries in 127.

Some of the French communes have imposed on motor vehicles the same tax that applies to horse drawn vehicles, the rates being as follows: Two-wheeled motor vehicles, \$1.20 per year; three-wheeled, \$1.80 and four-wheeled, \$2.40.

The president of the Bicycle Repairmen's Protective association of Milwaukee has appointed a committee of five to draft a uniform schedule of repair charges.

## LARGE MOTOR VEHICLE DEAL

### ONE THOUSAND FROM EACH FIRM

#### First Reports of Gigantic European Contract for American Vehicles Partially Confirmed.

The preliminary reports of an immensely large order for American motor vehicles of various type and manufacture which were recently published in the daily press throughout the United States, and to which reference has been made in two recent issues of this paper, have been sufficiently confirmed by investigation to place it beyond all doubt that the transaction, while not so incredibly large as first reported, yet constitutes the most important event which has so far marked the development of the American motor vehicle industry.

#### Responsibility Undoubted.

According to the first reports, Count de Jotemps of Paris, president of the American Motor General Agency of Paris, which has a capital of ten million francs, or two million dollars, contracted during a visit to this country with each of the following companies to have delivered one thousand vehicles per year for ten years to the above mentioned Parisian company: The Fischer Equipment Company of Chicago, electric carriages; the Holyoke Motor Works, Holyoke, Mass., gas engine vehicles; the Overman Wheel Company, Chicopee Falls, Mass., gas engine vehicles; the Stanley Company, Newton, Mass., steam engine vehicles.

It was further said that among the stockholders in the Paris company are Albert Geiger, a Boston capitalist, and the Duke of Milton.

Count de Jotemps, it was stated, married a Mrs. Bennett of New Haven, Conn., several years ago, and with his bride acquired an immense fortune.

In regard to the responsibility of the purchasing company no additional direct information has been obtained, but there seems to be little room for doubt on this score. Mr. Geiger, the Boston capitalist, writes upon inquiry that he is not yet a stockholder in any company handling automobiles, but that "it is quite possible that I may take an interest in the business. I leave for Europe to-morrow to determine this proposition."

#### The Correct Figure.

C. E. Woods, the constructor and general manager of the Fischer Equipment Company, states that the contract entered into is not for 1,000 vehicles a year for ten years, but for 1,000 vehicles in all, one hundred to be delivered each year.

The same reduction of the figure probably applies to each of the other companies.

The Stanley brothers, upon inquiry, directly confirm the report as true so far as they are concerned. The Overman company and the Holyoke company do not contradict the report.

From all of this so far, it is pretty certain that the Fischer Equipment company and the Stanley brothers are expecting to make large immediate deliveries of their wagons to the Count de Jotemps' "American Motor General Agency of Paris," that Mr. Geiger has serious thoughts of an investment and that the Victor and Holyoke explosion motor driven wagon makers will be likely to deal with the count's company as soon as they have wagons to deliver.

#### The Moral of the Event.

Now the burning question is, why does the Count de Jotemps come from Paris, the present center of automobile use and construction, and contract for motorcycles

in America, where almost no mechanically driven wagons are in use?

Are we to flatter ourselves that our work is so good for the money, that we already lead the world in motorcycle manufacture? Unquestionably we can build any number of vehicles here which any customer will pay for, and unquestionably the French makers are very slow in making provision for extended automobile manufacture. With, it is said, advance orders covering a year's maximum production, the largest of the French motorcycle producing establishments has only about 600 men in work, and it is possible that this slowness in production of motorcycles at home drove the count to America for a supply of carriages to open his spring trade with in the European capitals.

Whatever the cause of these large contracts for American vehicles, the result is so far extremely gratifying. Undoubtedly the American vehicles will give satisfaction to their purchasers and our motorcycle makers can have the very substantial satisfaction of knowing that if the American public is a little slow in taking up the mechanically propelled wagon, other nations are prompt cash purchasers of American vehicles.

#### Big Order Worries Frenchmen.

The latest French cycling papers discuss at length the \$5,000,000 orders for motor vehicles recently reported to have been placed in Chicago and in the east by Count de Jotemps and throw discredit on the canard, as they call the story. They sneer at the readiness of the Americans to make contracts, but seem to have taken to heart the effectiveness with which American makers of bicycles have in a very few years distanced their European competitors and taken from them even their own home markets, for the papers cautiously say, "Let us not laugh at a people who can make up lost time so quickly. There is nothing impossible in the entering of American motor vehicles on the European markets. Five hundred vehicles a year will not be an extravagant number, so great will be the demand and so prompt the delivery. Perhaps this is the spur that French makers need to make them a little more active. While we hope there is some exaggeration in these figures, yet there must be some truth in them also."

#### Location of Electric Vehicle Co.

The location of the American Electric Vehicle company was inadvertently given in the Chicago cycle show report as Indianapolis. All connection between this company and the Indianapolis firm having been severed, as stated in the published letter from the American Electric Vehicle company, all mail should be addressed to the company's general offices at 1545 Michigan avenue, Chicago.

The Stettin Cycling Club, organized fifteen years ago, is the first wheelmen's club in Germany that has created a special automobile membership. Many of its members own motor bicycles, tricycles and cabs.

Several manufacturers of Bordeaux are building motor cabs for public use in that city. One has completed two such vehicles, and has asked permission to station them in the public thoroughfares.

The municipal council of Vienna has bought a "three-seated tricycle" for use by the firemen, and to be used by the police in urgent cases.

Testimony of general reputation is not admissible to charge a person as a member of a firm.

## We Don't Want a Cent

of your money unless you get value received for it. For that reason we want to show how much better you can do with the every day

# Ariel

You can depend on getting satisfaction for your customer; our lists are popular.

Nine Handsome Models ranging in price from \$40 to \$65 for Chain Wheels; two Models Chainless, \$75; Tandems, \$75 and \$85

The latter price is for our tandem with rear drop and front diamond. Get our catalog, now ready.

THE

# Waverley

## Bicycle for 1899

## Plain Talks on THEY NEVER DISAPPOINT Andrae Cycles

V—Track Racer, Model 42, \$60.

More amateur races have been won on the Andrae than on any other one wheel made.

That's a fact—a recorded fact.

More amateur riders are riding the Andrae than any other wheel.

That's another fact.

But the one, all powerful, money making agency fact, is the fact that the only inducement we offer racing men to ride the Andrae is the wheel itself.

The racing man who usually wins races is smart enough to ride the fastest wheel.

Rigidity and easy draught—Andrae features—are the secrets of speed—and then, Andrae racers weigh only 20½ pounds.

The man who handles the Andrae line of 14 models, can sell the racing models—he needn't give them away.

Many men who do not race ride the Andrae racer, because it runs so easy.

You cannot lose more than a two-cent stamp by writing for our trade prices.

**Julius Andrae & Sons Co.**  
MILWAUKEE, WIS.

Eastern Export Branch: 95 Reade St., New York City.

WE told you last week about the remarkable price the Waverley Bicycle would be sold for in 1899—

# \$40

but there wasn't room to tell you of the quality and improvement in the Waverley itself.

We have been at work on the 1899 model for months, perfecting each detail in the light of past experience, until we know the new Waverley is the best bicycle we have ever built—which is saying much—and are confident it will have few, if any, equals in beauty and satisfaction-giving quality.

The 1899 Waverleys have already been tried and tested during the Autumn months by hundreds of experienced riders, and they say the Waverley is the best and handsomest machine on the market—and they don't make any exceptions.

The Waverley Agency (filled in with our Matchless Ivanhoe line at \$35 and \$25) will be a profitable investment. Write at once.

**INDIANA BICYCLE CO.**  
INDIANAPOLIS, IND.

# INFORMATION FOR BUYERS

## THE VICTOR SPIN-ROLLER GEAR.

Until the present season the Overman Wheel company has never been satisfied to place upon the market a substitute for chains on Victor bicycles. One of President Overman's maxims has always been the David Crockett cry: "Be sure you're right, then go ahead," believing this to be better than to be sure you're wrong then stop.

The Victor chainless is constructed with roller gears. The plan is known as the Spin-Roller and is illustrated in the accompanying cut. It consists of two sets of intermeshing, rotary roller teeth, each tooth curving inwardly towards its axis. The rollers are supported at their outer ends by a plate with finger-like projections, which holds the rollers rigidly and prevents them from springing, in the slightest degree, when pressure is placed upon them.

Prof. R. C. Carpenter of Cornell University who made tests has shown the Overman company that the Spin-Roller gear has an efficiency of 97½ percent under heavy load, and that the gear therefore complies with the important requirement of perfect economy of driving power. In order to obviate pulsating sensations in the feet, such as may be caused by spring of the crank hanger if gears intermeshing with line contact are employed, the Spin-Roller is so constructed, that when one roller rolls against another, the working surfaces are in point contact, and for this reason will stand any required degree of deflection. With its simple mechanism the line of pressure is always vertical, upwards at one end of the shaft and downwards at the other. It is stated that the gear is very responsive to the lightest pressure applied to the pedal, that back-lash is extremely small and that no adjustment to take up wear is ever needed. It is unusually durable, entirely protected,

easily taken apart, and in case of accident any part can be quickly replaced at very slight cost. The company expects to show the Spin-Roller with their New York cycle exhibit next week, although machines will not be ready for delivery before March 1.

The Overman Wheel Company this year are making but one Victor model, and are turning out more of this one pattern than ever manufactured before of all patterns combined in any one year. The chainless is to be the same model in all particulars except the Spin-Roller gearing, and this is to be furnished as an option at \$25, making the price of the Victor chainless \$75.

## ARMSTRONG READY REFERENCE SHEET.

The Armstrong Bros. Tool Co., of Chicago, has issued for the benefit and convenience of its customers a large sheet of illustrations showing the many sets of frame fittings made and sold by it. The sheet is in the form of a plain, durable hanger which may be tacked to the wall in some handy place in the repair shop or factory. The illustrations are accurate scale line drawings well marked with all of the specifications and measurements necessary for reference in building up the parts into complete frames. The line of fittings handled by the Armstrong company is large, including several patterns of single machine frames calling for both outside and flush joints and for 28 and 30-inch wheels and for different sizes of tubing and hanger drop. Frame sets for single and double steering tandems and for triplets, quads and quints are also a part of the line. The company is finding a ready sale of its two-piece crank and axle hanger and is also earning popularity with its handle bar attachments for single steering tandems. A very popular set of frame parts are those

for the special track racer with one-inch tubing, 28-inch front and 30-inch rear wheel, and 4½-inch hanger drop.

## THE PAULI ACETYLENE GAS LAMP.

The gas lamp made by the Pauli Lamp Co., 39 Franklin street, Chicago, is automatic in gas generation. It possesses many novel features. It has no screws, no wicks, and only one valve, which is used to keep the water and carbide separated when the lamp is not burning. You open the water valve and leave it open, apply a light to the stack, and the lamp does the rest. It can be

charged in a couple of minutes without removing the lamp from the bicycle. This is a new feature and is of the greatest convenience. It weighs about one pound, is strongly built and mechanically perfect. It has an adjustable swivel bracket which fits any wheel. You can turn your wheel completely over and the lamp remains right side up. While riding, a column of light can be thrown in any direction ahead by shifting the reflector. The packing is an integral portion of the lamp and, while easily replaced, cannot be lost. As the lamp always packs in the same place, the packing is practically indestructible. The tip or burner never carbonizes. It will not blow or jar out under ordinary circumstances. It can be lighted without dismounting by twirling the head of a parlor match just inside the top of the stack.

## LIGHT STANDS FOR LAWN USE.

The production of the bicycle stand for use on lawns, by the Snow Wire Works, of Rochester, N. Y., as here illustrated, is sufficient occasion for a mild sort of surprise that no enterprising manufacturer of specialties or some practical inventor has not

long ago recognized the field of utility for such a device and the opportunity presented for profit in its wide introduction. Everybody who lives in the city has seen bicycles scattered about over the lawns and commons of the park lying flat on the grass or standing against the trees except where

this license is denied by the rules of the park board, and the utility of such a device on private lawns, especially where there are tennis or croquet grounds, in the event of a lawn social or party, is plainly obvious.

The simplicity of this lawn stand is its chief recommendation. It consists merely of a stout iron post of Y section with three iron plates riveted to the ribs near the middle to anchor it more firmly in the ground. Two circular plates are disposed at the top to hold the wire springs that receive the tire of the rear wheels and hold the machines upright. Each post is designed to hold six or nine bicycles. The entire device is light and unobtrusive, yet it is not liable to breakage or disarrangement. Common appreciation of a "good thing" will make them popular next summer without a doubt.

## THE VEEDER TRIP CYCLOMETER.

The new bicycle mileage recorder gotten out by the Veeder Mfg. Co. of Hartford, Conn., is practically two cyclometers placed side by side. One of them registers up to 10,000 miles and records the total miles traveled, and the figures are of the same size and the mechanism similar to that used in the regular 10,000-mile Veeder cyclometer.

The trip cyclometer is operated from the same mechanism as the total and registers to 100 miles, but can at any time be set back to zero, thus enabling the rider to secure at a glance his daily or hourly mileage. The distance from one town or city to another, or, in fact, the distance from any one spot or place to another, is at once shown without the aid of a pencil and more or less figuring.

To set the trip record to zero all that is necessary is to pull out the knob and turn

the same forward until all the figures become zeros, and then push the knob back into place. When the knob is thus pushed into the case the mechanism is mechanically locked and cannot fail to register or register too much.

All gears are scientifically designed and made with the greatest accuracy, and this, together with the absence of springs, renders the motion of the instrument easy, smooth and uniform. It is no wider than the regular cyclometer and hence is just as free from accidents.

T. H. Cranston & Co., 60 Wabash avenue, Chicago, are western agents for the Veeder cyclometers.

## CLIMAX SPRING WIRE SADDLES.

The Climax wire spring saddle, made by the Climax Mfg. Co., of East Hampton, Conn., has proven so satisfactory in its present form that its maker has not been compelled to make any radical changes in its construction. The saddle, which has been patented in the United States, Canada, Great Britain, France, Spain, Belgium, Italy and Victoria, consists of an endless wire frame covered with a series of spring wire cords secured at each anchorage point in a manner which makes the security of each wire independent of the others, but still renders them all easy of removal should it be desired to replace a worn with a complete new top. The cords are very elastic, conform to the rider and have sufficient elasticity to return to their normal position when the rider dismounts, thus always insuring the same shaped saddle, there being no permanent sag or settling of the top. The wires are covered with a special light ventilated leather top which follows the yielding of

the wire cords under the rider. Three patterns of the saddle are made to suit varying tastes in saddle shapes.

**RUBBER COVERED TOE CLIPS.**

With the double object in view of saving shoe leather and making toe clips more comfortable to tender feet, the White Mfg. Co., of Ithaca, N. Y., is putting out two styles

of clips protected or cushioned with soft rubber. The one here shown is formed of bent spring wire covered with rubber tubing. It is made in two lengths, the ladies' clip being short and broadened somewhat on top. The rubber covering makes it as easy and comfortable to the foot as if no steel entered into its construction. The other style is a flat steel stamped clip bifurcated at the point of the shoe and curving upwardly over the instep. This is simply lined with thin sheet rubber riveted in place. It effectually prevents the usually sharp edges of such clips from chafing the leather of the shoe and also clings to the foot holding it in place without any uncomfortable pressure and rendering the use of side clamps unnecessary.

**TURNER DETACHABLE DRESS GUARD.**

Neat dress guard lacing always adds to the beauty of a lady's bicycle and with view to making it possible for any one to equip machines with tastily laced netting without

having to go to the trouble and expense of slow hand lacing the Ossawan Mills Co., Norwich, Conn., supplies netting in pairs ready laced, leaving only the attachment to the machine for the bicycle assembler to do. Each net is firmly tied to a nickel plated metal bracket bored to fit over the axle of the rear wheel. The work of applying takes but a few minutes it being simply necessary to run the free cord through the eyelets in the guard. The two nets comprising a pair are joined together by a piece of metal so that they need not be separated until needed by the workman. The guards yield to the slight movement of the rear wheel axle in adjusting the chain. Various colors and styles of cords may be had.

**FEATURES OF NATIONAL HANDLE BARS.**

On the fixed handlebars supplied by the National Cycle Mfg. Co., of Bay City, Mich., the one nut on top of the tee controls the

vertical adjustment, while on the adjustable bars the bolt and nut passes through a hollow bolt which controls the sweep of the adjustment. A peculiar and valuable feature

of the adjustable bar is that when the rider desires the drop position the bar is an inch and a half forward of the center; when a raised position is desired the distance back of the center is the same.

**AN ARTISTIC PERPETUAL CALENDAR.**

One of the really handsome advertising hangers of the season is the perpetual calendar being sent out by the Standard Varnish Works, of New York, Chicago and London, which makes a complete line of enamels for the bicycle trade. This calendar is in the shape of a cardboard hanger 12 by 19 inches bearing a lithograph in exquisitely delicate colors on stipple paper of a bewitching young woman in stage costume who is caught in the act of tossing four large balls in the air. Each of these balls represents the earth, with different sides showing the continents turned toward the observer, and a section is cut out of the periphery of each exposing letters and figures underneath which designate the month, day of the week and date of month. Revolving these discs upon their central eyelets brings new figures and words into view successively. In four languages the poster announces that these are the largest varnish works in the world.

**SIX THOMAS MODELS.**

The six models comprising the line of the Thomas Mfg. Co., of Springfield, O., have flush joints throughout and are fitted with

Model 27—Roadster. Weight, 21 lbs. Price, \$50.

Model 28—Ladies'. Weight, 26 lbs. Price, \$50.

Model 29—Road racer. Weight 23 lbs. Price, \$75.

two-piece crank and axle groups. Both of the ladies' models have double curved front frames and chain guards which extend entirely around both sprockets. The guards have ornamental aluminum side panels. Model 29, the \$75 road racer, has a frame of the three-crown pattern. The hanger is of the eccentric type, allowing a drop of from 2 to 3 1/4 inches, with a corresponding variance in frame height. The hubs are disk adjusting and so made that the wheels may be removed from the frame without disturbing the adjustment of the bearings. Kelly or reversible, ram's-horn handle bars are supplied. The \$60 road racer, Model 22, also has disk adjusting hubs, but the hanger is not fitted with the eccentric device. The drop is 3 inches. The head is one-piece, electrically welded and the rear forks and stays are of continuous taper gauge stock. Wheeler and Sager are the regular saddles fitted, and the tire options on the various models include Morgan & Wright, Kokomo, Chase, Hartford, Dunlop, Goodrich and Palmer tires. Black, wine, brown, green and orange are among the finishes offered.

**CAN FILL ORDERS FOR SPAULDING PARTS.**

John R. Keim, who purchased the realty and the entire plant hitherto operated by the Spaulding Machine Screw Co., at Kensington Station, Buffalo, N. Y., will continue to manufacture frame sets complete, hubs, pedals, seat post clusters, etc., under his personal supervision. The plant is replete with the most modern and most effective machinery and is splendidly equipped to manufacture the best product at minimum cost. A new catalogue is in

the press and will be distributed at an early date. Mr. Keim is now fully prepared to quote prices, submit samples and receive orders, and gives assurance that in all instances orders will be completed at the time agreed upon.

**IVEN-BRANDENBURG FITTINGS.**

In its latest catalogue the Iven-Brandenburg Co., of Chicago, is showing several new things in the line of fittings and material for which it is United States selling agent.

The well known Thor parts comprise four patterns of hubs and two styles of hangers. Both hangers have the Thor two-piece mechanism, but one is fitted in an eccentric bracket which is distinctive among its kind by reason of the absence of unsightly outside lugs for the clamping of the eccentric. In the Thor perfection hub uniform wear entirely around the cone is aimed at by making the cone of such form that it can screw into the hub barrel and revolve with it. The cup is on the axle. Forged crank brackets accurately machined by the Aurora Automatic Machinery Co., are offered in several patterns, there being brackets for 28 and 30-inch wheeled machines outside and flush joints, and for regular and three-crown frames. Brandenburg pedals are catalogued in several patterns, in some of which, as in that here illustrated, the oiling is done through a hole in the barrel, this hole being closed by a thin spring ring. Thor head fittings and specialties, Sager saddles, Tucker V section wood rims and guards of

same make, Morse-Keefe spokes and nipples and Lefever chains complete the line, with the exception of the Sager roller gear which is also controlled by this firm. The Sager gear is now sold in complete sets, including the gears and pinions, and boxes and rear end frame fittings to match. Either the gears alone or the complete set of fittings may be purchased. Gear cases will be supplied if desired, though it is one of the prominent merits claimed for the gear that its action tends to throw out dirt rather than collect it. The machines used by the colored rider, Major Taylor, in his successful trials against time at Philadelphia, were not fitted with cases, the gears running entirely open. The Iven-Brandenburg Co. also sells the Her-

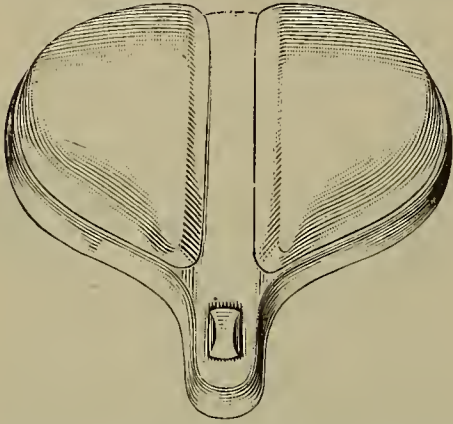

tel motor vehicle which was described in the previous issue of Cycle Age.

**SPALDING CYCLES AND PRICES.**

The Spalding line of bicycles consists of five different models. The chainless has a 22-inch frame, is finished in black enamel, with fine white striping, and has black rims and red band center. The 24-inch chainless is finished in blue enamel, white striped, has blue rims and red band center. These machines are handsome in design and possess many points of mechanical detail which simplify their con-

struction and will appeal strongly to the mechanical mind.

The ladies' chainless has a 22-inch frame, and is finished in two styles, one in black enamel, white striping, with guards to match, and rims black with red band center; the other finished in blue enamel, white striped, with guards to match, and rims finished in blue with red band center. The

ladies' chainless embodies the same mechanical features found in the men's model. The lines of the frame have been carefully studied, and while exceedingly graceful, afford ample room for free and easy action in riding, and convenience in mounting and dismounting.

There are two models of the Red Head racer, one having a 20-inch frame, the other

a 22-inch frame. Finish is the same in both models, consisting of blue enameled frame and forks, with red head and fork crowns, blue rims with red band center. The Spalding racer embraces many new features not found in previous models. Every part of its mechanism has been improved wherever possible, and it is said by the maker to be

the best chain bicycle it has ever produced, and in quality and excellence leaves nothing to be desired. The new special finish on this machine is distinctively Spalding, and will appeal strongly to the class of riders who favor this type of machine for road use.

Two models of the Spalding roadster are also offered both in the 22-inch frame, one

finished in black enamel, with black rims and red band center; the other finished in blue enamel, white striped, with blue rims and red band center. This machine is especially constructed as the company's leader for the general trade. In lines and general appearance it resembles the Spalding racer, and all of the parts and fittings re-

ceive the same care and attention as the corresponding parts in the other machines.

The ladies' roadster is made in two models, both in 22-inch frame, one finished in maroon enamel, white striped, with rims and guards to match; the other in blue, with black rims and red band center. This machine is the counterpart of the roadster in quality and workmanship; in mechanical detail the machine has been improved and represents the latest and best in everything that goes to make a ladies' ideal mount.

Sprockets are furnished in the following sizes: 20, 22, 24, 25, or 26 teeth, front; 7, 8, 9, or 10, rear.

The tire equipment consists of the Kangaroo, Goodrich, Hartford, or League, with an additional option of the Palmer tires on the chainless and racer.

Eight different styles of handlebars are given as options, including two adjustable bars.

All models, with the exception of the racer, have 2 1/2 inches drop at crank hanger; racer has 3 inches drop.

Christy saddles will be the regular equipment, with options of other standard makes. The five Christy models give a variation in size and width sufficient to satisfy all demands.

No. 1 is of medium size, with seat 8 1/4 inches wide; No. 2 is of large size, having a seat 9 inches broad; No. 3 is small, being only 7 1/2 inches wide. These are the men's saddles, while Nos. 8 and 9 are for women, the former being the small size with a seat 7 1/2 inches broad, and the latter the large size, two inches wider.

The Christy racing saddle is made with an extra long pommel, to enable the rider to get more "purchase" when sprinting, and is ridden by many of the leading racing men.

The form and method of the coil spring is shown in the last illustration.

**FILLS BUNKER SADDLE ORDERS PROMPTLY.**

In its new five-story brick factory at 65 Milwaukee avenue, Chicago, the Bunker Saddle Co. has ample room for the carrying of a large stock of made-up goods and facilities for making up goods rapidly to fill special and contract orders. Promptness in filling orders and careful attention to details of shipping are characteristic of the methods that have won success for the Bunker line of saddles, belts, tool-bags and similar specialties. Employing only skilled workmen in all branches of its factory, the Bunker company has perfect confidence in the quality of its productions and invites comparison of its popular Rubber Neck saddles with others of domestic or foreign make. The latest design of this saddle is the Rubber Neck Special, suitable for both ladies and gentlemen riders. The soft rubber honeycomb cushion which constitutes the distinctive feature of all Rubber Neck saddles, is molded for the Special with a raised portion on either side and a longitudinal depression in the center after the type of padded hygienic saddles marketed the past year or two. The special is two inches broader than it is long, giving a comfortable seat while riding, yet the surface contour is such that there is no tendency to shift around on the saddle under the jolts incident to car tracks or rough roads.

**CREATED A WRONG IMPRESSION.**

As the recently published decision of the court in the patent suit of the Bridgeport Brass Co. vs. Edward Miller & Co., in which the validity of five of the claims on the Searchlight lamp was sustained, was liable to create an impression that Miller & Co. would be enjoined from using the Searchlight improvements and their customers held liable for possible damages for past sales, the Bridgeport Brass Co. explains that a satisfactory adjustment of profits and damages between the two litigants has been made. Miller & Co. have taken an unrestricted license under all the five Bridgeport patents authorizing them to make and sell bicycle lamps containing each of the improvements embraced therein and their customers are exonerated from past damages and future liability for sales of lamps embodying these features of the Searchlight.

**MAKES TIRE PUMPING EASIER.**

The No. 3 coupling for hand pumps made by the Buescher Mfg. Co. of Elkhart, Ind., is reported to be meeting with a large amount of approval and seems likely to become very popular this year because it saves the time and trouble of screwing the connection into the valve end. It is an instantaneous and effective means of making the connection between pump and tire.

**WHEELER SADDLE PRICES.**

In the Chicago cycle show report in last week's issue of Cycle Age the weights and prices of the Wheeler saddle models on exhibition were wrongly given. The Wheeler Saddle Co., of Detroit, Mich., announces them as follows: Men's Extra, list price \$3.50,

weight 15 ounces; Women's Extra, coil springs, list price \$4, weight 23 ounces; Men's Special, list price \$3.50, weight 14 ounces; Men's Cork Top racer, list price \$3.50, weight 14 ounces.

**STERLING AND DAISY BELLS.**

After ten years of experience in the production of nothing but bells the N. H. Hill Brass Co., of East Hampton, Conn., con-

siders that it is not out of place to invite the confidence of the trade in its complete line of bicycle bells, all of which are manufactured by this company from the raw material at a consequent saving of cost to the dealer and purchaser. All of these bells are cast from the pure bell metal and are warranted to give satisfaction in every

way, the makers claiming that for excellence of castings and finish of workmanship, clearness and resonance of tone its bells cannot be excelled.

The Sterling bells are made in fifteen styles, having the double, quadruple, electric and rotary electric stroke, and are made in plain and beaded patterns and fitted with

screw and lock clamps. In the first illustration herewith presented is shown the dome pattern bell having the rotary electric movement and the lock clamp. Another form called "Our Beauty" is shown in the second cut. It is similar to the other except in shape of the gong and the bead-

ed edge. This one is shown attached to the screw clamp. The "Fleur de Lis" is a more ornate bell of the same type. All of these are made in five sizes, from 1 1/4 to 2 3/4 inches in diameter of gong and fully nickeled. The fourth cut represents the "Continuous Ringing" electric movement bell. It is made in but one size, 2 3/8 inches in diameter. The Trinity Chimes quadruple stroke alarm is

also a product of the Hill factory. The Daisy line of bells is similar in form, stroke and clamping means, but lists at cheaper prices and has steel bases instead of brass bases such as the Sterlings have. All of the bells of both lines are nickel plated and have interchangeable parts.

**CHOICE SELECTION OF SPECIALTIES.**

H. W. Coolidge & Co., manufacturers' agents, at 135 East Lake street, Chicago, have added the Bundy acetylene lamp to their line. This lamp is made by the Frank E. Bundy Lamp Co. of Elmira, N. Y., and is a new lamp which has been introduced on the market on the strength of its superior special construction and the confidence in its selling qualities which its construction inspired. It has been previously described in this paper. Among the other specialties handled by the Coolidge firm are the Kokomo Rubber company's pneumatic tires, Defender, Special, Oxford, and Cloverleaf, Newark Special saddles which, by their exceptionally neat appearance, aluminum base and light weight, have quickly been brought into prominence among low priced saddles, and Oak saddles which are constructed on the popular English Brooks pattern, with option of plain or hygienic top.

**FERRACUTE PRESSES FOR HEAVY WORK.**

A special circular has just been issued by the Ferracuta Machine Co. of Bridgeport, N. J., illustrating and describing the various styles of machine presses which it builds. This will be followed a little later by a complete catalogue of 300 different kinds and sizes of such machines. Its latest designed presses are heavy, massive and accurate machines designed especially for the heavy work required in the regular bicycle factory. The straight-sided or "D" presses are used for cuttings of all kinds, while the punching presses are used for cutting out various parts and for trimming drop forgings. The company makes six to eight sizes of each style and builds the presses either single or double action and with or without gearing.

During the three or four years of the boom in the bicycle business the Ferracuta works were run almost entirely on presses for the above line of goods, and the company is still furnishing large numbers of presses to the various bicycle manufacturers over the country, and has recently put in several outfits for making saddles, pedals, toe clips, lamps and other bicycle accesso-

ries and is furnishing a number of presses for the regular bicycle business among its customers who find the Ferracuta presses well adapted for this heavy class of work.

Machinery made by the Ferracuta company is found in most of the large bicycle factories throughout the country and its presses are being constantly sent abroad, a large trade having been secured in England, France and Germany.

**THE KENSINGTON PEDAL.**

The pedal shown in the accompanying illustration is to be placed in the market this season by John R. Keim, successor to the Spaulding Machine Screw Co. of Buffalo. Especial attention is called to the side plates which are made from 18 gauge bright stock

and are strengthened with deep corrugations on the upper and lower edges as shown. The pins and bearings are carefully made and adjusted and the dust cap covering the outer bearing is threaded and fits tightly over the threaded end of the pedal barrel. The manufacture and sale of these pedals and of a full line of bicycle parts are to be pushed throughout the season.

**THE HEARSEY SOUVENIR.**

The H. T. Hearsey Cycle Co., 216 Penn street, Indianapolis, acting as Indiana distributor for the Crescent bicycles, is sending to its trade handsome souvenir calendars, the decorative feature of which is a half tone illustration of three girls on Crescent juve-

nile cycles coasting with interlocked arms down a hill. The picture is well known and is recognized as a very fitting advertisement for the Hearsey company's business, because the original maidens who posed for the picture are Mr. Hearsey's own children. Besides the calendar the company is advertising its bicycle business through the medium of a six-page folder, illustrating the several models of Crescent machines.

**STRAIGHT AND LATTA HANGER SETS.**

The Straight Mfg. Co., of Jamestown, N. Y., manufacturer of crank sets solely, is continuing to offer for this season its well known Straight two-piece set, with improved construction, now known as Model 2. The stability and simplicity of this set has commended its widespread use and it will be found on a large percentage of the medium grade bicycles manufactured by the better class of bicycle makers.

Cranks are furnished in 6½-inch for women's bicycles and 7-inch for men's; sprockets in 20, 22, 24, 26 and 28-tooth sizes, for 3-16 inch chains unless otherwise specified.

The Straight company has added to its line this season its Latta set, a two-piece crank construction invented by E. G. Latta, one of the pioneers in the bicycle industry. The left crank is integral with the axle, which is tapered and flattened on opposite sides at its extremity, and is left threaded adjacent to the tapered end. The right crank is broached through on a taper corresponding to the axle end, and a recess is milled on the inner face of the crank at right angles to the broached hole, leaving a flange all about the face except on that portion adjacent to the carrier boss, where it is open. The sprocket has an internally threaded bushing or hub, by which it is screwed on the axle, and on its outer end is a rim or shoulder adapted to enter the recess in the right crank, in which it will freely rotate.

To assemble the set, it is merely necessary to slip the right crank down over the shoulder of the sprocket hub, and screw the sprocket on the axle. The sprocket will draw the right crank on after it and force the crank to its seat on the axle end. A heavy, taper headed bolt passing through the sprocket screws into the carrier and holds the parts rigidly together. The carrier bolt hole in the sprocket is reamed on a taper to fit the bolt head, thus obtaining a large bearing surface together with compensation for any wear. To take the set apart it is only necessary to remove the carrier bolt

**LABOR-SAVERS**

We all know what tight bearings mean inside the wheel—how about them outside? **The point of contact between tire and ground is just as much a bearing as the point of contact between axle and balls.** In the inside bearing we increase or lessen friction by moving the cone—in the outside bearing, by changing the tire.

Tires made of cheap rubber and fabric increase the friction of riding, run heavily, waste driving power.

**Tires made of fine rubber and fabric—LEAGUE TIRES—cut down the friction, run easily, save labor.**

Your customers are bright men and women; they believe in labor-saving devices—find it pays to use them. What's good for them to buy is good for you to sell. Specify "get there and get back" tires on your wheels.

**LEAGUEKIT**

Only repair tool making both cement repair and plug repair. Simple, quick, certain. The Century Record Holder, John H. Nobre, pronounces it the best kit he ever used.

- New York..... 25 Park Place.
- Boston..... 24 Summer Street.

**NEW YORK BELTING & PACKING CO. LTD**

Mention The Cycle Age

and back pedal, when the right crank and sprocket will drop off.

Cranks for the Latta set are furnished in 6½-inch and 7-inch for men, and 6½-inch for women; sprockets in 20, 22, 24, 26 and 28-tooth sizes for 3-16-inch chains unless otherwise specified.

The cranks for both sets are made from high grade steel, and every crank is individually hardened. Drawing is done by pyrometer.

The sprockets for the No. 2 set are high class drop forgings. Those for the Latta set are the well known Parish & Bingham make. No castings or malleables of any sort are used. The factory capacity is 1,000 sets a day, and all inquiries should be addressed to the Geo. L. Thompson Mfg. Co., of Chicago, which is general agent for the manufacturers. No sets sold at retail from the factory.

**ARCADE FILE WORKS' ELK BICYCLES.**

The Arcade File Works of Anderson, Ind., last fall began preparations, among which was the erection of a new factory building, for the manufacture of bicycles. Its line, which is now completed and models of which are ready for delivery, comprises six patterns of Elk cycles selling at \$25, \$40 and \$50. Models 10 and 11, the men's and wo-

Model 10—Men's roadster. Price, \$50.

Model 20—Men's scorchers. Price, \$40

Model 21—Ladies'. Price, \$40.

Model 30—Men's roadster. Price, \$25.

men's patterns of the \$50 machines, have popular lines, flush joints and Fauber hangers. Black is the regular finish, but an option is allowed of maroon or Empire green enamel. Hartford, Morgan & Wright or Dunlop tires are fitted. The \$40 patterns, Nos. 20 and 21, have flush joints, two-piece hanger groups, and are fitted with Kokomo tires. Models 30 and 31 are similar in appearance to the \$40 patterns, but are offered with a smaller range of options.

**PEERLES MODELS AND CONSTRUCTION.**

The Peerless Mfg. Co., of Cleveland, has issued a complete illustrated catalogue in which the several Peerless and Triumph bicycles are fully described. The mechanical construction which has won prominence for the Peerless is clearly shown so that even the uninitiated may grasp the ideas presented. The Mather hub for straight tangent spokes is now fitted to all Peerless models, and the well known Peerless tubular fork crown and the Peerless reversible seat post are retained as valuable features of the machines. All models are built with 30-inch

wheels if desired. A single or double steering double diamond tandem and a graceful combination tandem complete a line from which almost any customer could select a mount that would satisfy him.

**CLEVELAND'S NEW ROLLER SKATING RINK.**

A company composed of well known citizens of Cleveland, Ohio, have secured for a roller skating rink the Cleveland Grays' armory. The building has been furnished with a new maple floor and is without question the finest rink in the country. It is furnished with 600 pair of Henley's celebrated roller skates, and was opened last Monday evening with a full military band in attendance. Cleveland has always been a popular city for roller skating and this enterprise will undoubtedly prove a complete financial success.

**PIERCE LINE ON EXHIBITION.**

The Pierce bicycles, manufactured by the George N. Pierce Co., of Buffalo, N. Y., will be exhibited at the New York cycle show in sections 60, 61 and 62. The exhibit will consist of their entire line, including the chainless at \$75, cushion frame at \$65 and \$50, racers at \$50 and \$60, tandems, both double diamond and combination, at \$85, and their regular chain models at \$40 and \$50. This company's eastern manager, S. J. Thompson, will be in charge, assisted by the managers of the various branch stores. The cushion frame machine has sprung into great popularity in the metropolis and will be one of the interesting features of the exhibit.

**ORIGINAL IDEAS IN CATALOGUE MAKING.**

Several original and unique features are embodied in the make-up of the recently issued catalogue of the National Sewing Machine Co. of Belvidere, Ill. It is so designed that when the catalogue is folded to go in the pocket the creases in the paper will not cross the half tone illustrations of the various models and spoil their appearance. The ladies' and men's machines of each model appear side by side for ready comparison. The specifications and constructional details are also presented in a more than ordinarily striking manner.

**TYPOGRAPHICAL MISTAKE IN PRICE.**

The advertisement of the Cycle Syndicate, 320 Broadway, New York City, in last week's issue of Cycle Age stated that the syndicate would accept orders for its fire and water proof calcium carbide storage tank and 50 pounds of "Acetalite" deodorized carbide for \$2.50. As will be readily understood this price was much too low and was due to a typographical error. The correct price for the tank and 50 pounds of "Acetalite" is \$12.50.

**WANTS AGENTS EVERYWHERE.**

"Wheel Wisdom" is the title of an eight-page booklet which the Remington Arms Co., of Ilion, N. Y., is sending out to the trade to call attention to the Remington line and distinctive parts, such as the non-stretchable, detachable link chain and double tooth sprocket, one-piece crank and shaft, boltless seat post locking device, etc. This company is seeking to secure a live, reliable agent in every town in the United States.

**DIETZ WALL HANGERS.**

A six-color lithograph hanger is being sent to the trade by the R. E. Dietz Co., of New York, makers of the Dietz bicycle lamps. The design is an amplification of the well known Dietz advertising design, while on the reverse side are printed ten letters from prominent firms and persons testifying to the satisfaction derived from the sale and use of the Dietz lamps.

**CORRESPONDENCE WITH MAKERS SOLICITED.**

L. D. Munger and Fred S. Dickinson are operating as manufacturers' agents in the Mail and Express building, 203 Broadway, New York City. They are desirous of handling bicycles and materials in the east and have room in their line for goods of all descriptions, in which export trade can be secured.

**Egyptian Trade Requirements.**

Houses intending to send circulars to Egypt should print them in French or Italian, as these are the languages most commonly known to importers. It is also necessary to use the weights and measures of the metric system and have price quotations made in terms of the Egyptian tariff piaster, of which 100 are equivalent to \$4.94 of our money. There is a considerable importation of American small machine tools.

## CYCLING IN FLORIDA

### A Sportman's Paradise Where Cycling is Limited to Sea Shore and Cycle Paths.

About fifty miles down the coast from St. Augustine, the Halifax river becomes a charming series of landlocked salt water sounds, which bound the east coast of Florida for more than 175 miles, affording an inside passage through the tranquil stretches of the Indian River, St. Lucie Sound and Lake Worth, and it is near the head of this river where Ormond, the delight of Northern tourists, and the first prominent winter resort south of St. Augustine, is situated. Nothing can be seen of its beauties from the railroad station; a sandy waste is indeed labelled Or-

mond run back to Ormond was made comfortably at about an eight-mile gait.

#### Little Chance for Cyclist

Investigation proved that there was very little cycling at this point outside of the beach, and, as Daytona lay six miles down the river and was connected with Ormond by an excellent cycle path, the scribe was soon speeding over its rolling surface, now through a grove of palmettos, again startling a flock of wild ducks or crossing a little bayou in which the 'gator and the mud turtle sunned them-

fruit in the world can compare with it for sweetness and lusciousness of pulp. The East Coast train backs down a little spur to the river, and your correspondent mounted his wheel just as the afternoon sun was beginning to cast long shadows and to lose its fervor. The road, of coquina shell rock, wound along the picturesque bank of the river, overshadowed by tall palmettos. Its hard surface did not last long, however, so the rider soon took to the path, and, passing through an open gate, rode through an orange grove until the end of the path showed a sloping rock on which he stood and regaled the sense of sight with the beautiful expanse of the Indian river, on which wild duck were swimming, while mullet were leaping. In the distance lay Merritt's Island, famous for its orange groves and its immunity from frost.

#### Sportsman's Paradise.

There is, as yet, very little opportunity for the wheel at Rockledge, but the road is building to Coquina, three miles south,

mond Golf Club, but to no one except the enthusiasts of this game could it appear attractive. A good shell road, however, leads from the station to the river, and the road across the bridge brought your correspondent to the hotel nestling among the pines on the banks of the Halifax.

#### Photographs a Wreck.

It was a warm, bright day, and to get the full benefit of the sea breeze, your correspondent continued a half mile further to the coast, and was soon enjoying a good dinner at the Hotel Coquina, whose broad verandas extend over the beach. The tide was out, the sand hard and level and the wind blowing hard from the South. Two miles down the coast could be seen the dismantled form of a wreck, and to investigate this, as well as to test the power of the wind on the return, the writer struggled down the beach in a series of short tacks, the fine dry sand blowing like sheets of snow against the wheel. The wreck proved to be that of a large coasting schooner, the "Nathan E. Cobb," and after photographing it and the shore, the wheel was turned to the north and the slight impetus given it as your correspondent swung into the saddle, and with feet over the bars the

self. It is said that seven-tenths of the population of Daytona own bicycles, and this is not difficult to believe, as one rolls over the beautiful shell streets to be found everywhere. Daytona reminded your correspondent of Ocean Grove. The residences are well separated, the streets are beautifully shaded, and an atmosphere of prosperity pervades the whole. At this point another bridge crosses the Halifax River, connecting with the coast.

It would be a critical pleasure seeker who could not find contentment at Ormond by the sea. Cycling, driving, golf, hunting, fishing and yachting, and the varied delights of surf and still water are all here at his command. It seemed impossible to believe that anything more beautiful could be found, but it was soon discovered that the magical touch of the tropics had not opened nature's heart at Ormond as it had at Palm Beach and Miami.

It is a novel and pleasant experience to allay the thirst for which wheelmen are famous by plucking a juicy orange from amid the dark, glossy leaves and sucking or eating it on the spot.

At Rockledge the Indian river orange is at its best, and no other citrus

and is fine as far as Coquina, an equal distance up the river. Next winter visiting wheelmen are promised a path to Titusville, and doubtless another season will find Ormond and Rockledge connected by a series of excellent cycle trails, affording seventy-five miles of straightaway riding through one of the most picturesque sections of Florida. Rockledge is an excellent stopping place for the sportsman. The Indian river abounds in sea trout, cavalli, grouper, bass and mullet, and is covered during the winter season with flocks of wild duck, including mallard, pintail and widgeon. Across the river, in a large swamp, may be found plenty of alligators, which are often lassoed and taken alive to Rockledge. Three miles back from the village the hammock abounds in quail, and the large-mouthed bass can be caught in the small fresh water lakes which dot the region.

The cultivation of oranges in southern Florida is beginning to revive after the severe frosts of '93 and '96, and it is most sincerely to be hoped that in the near future the Northern market will be once again generously supplied with oranges, lemons and grape fruit from the state which alone produces them in perfection.

# THE PASTIME AND SPORT

## ELKES DEFEATS McDUFFIE

**Bostonian Ridden to a Standstill in 25-Mile Match—Elkes Calls for More Pace.**

New York City, Jan. 16.—Harry Elkes displayed his remarkable supremacy in middle distance racing last Thursday night in his twenty-five-mile match with E. A. McDuffie, whom he defeated by thirteen laps in 52:34 on the Madison Square Garden ten-lap track. McDuffie sought the match, and now he is a sadder but a wiser man. Before the start of the race he demanded payment of a disputed account of \$500 before making his appearance on the track and as a result the race was delayed for almost an hour until finally the money was paid to him.

Last year's middle distance champion took the lead in the first mile and gained slightly on the Glens Falls youth, but in the second mile the latter cut his time for the mile down to 1:55, taking all the pace he could get and calling for more, while the Bostonian had trouble hanging on to what was given him. After the first mile Elkes gained steadily on McDuffie and at five miles was 31 3-5 seconds in the lead. At ten miles he led by 1:01; at fifteen by 1:24 3-5; at twenty by 2:18 2-5, and at twenty-five by 4:25 2-5.

After the fifteenth mile the Bostonian loafed around the track in a most abject manner and was so clearly outclassed that many of the spectators, disgusted by the long preliminary wait and owing to the lateness of the hour, left the building before the end of the race. Each contestant had seven tandem teams, five of McDuffie's being teams formerly retained by Elkes.

## Racing Men Going to California.

The largest party of racing cyclists that ever crossed the continent will leave New York Friday for San Francisco to take part in the indoor racing that begins there February 11. An eight-lap board track has been laid in Mechanics' pavilion for the occasion. The first two days will be devoted to sprint racing, then a six days' race begins on February 14, and the following week is to be given up to middle distance events. About thirty riders will comprise the trans-continental party, which will include, among others, Harry Elkes, Jay Eaton, Fred Hoyt, Frank Waller and trainer, King Ryan, Teddy Hale, Oscar Julius, John Lawson, Oscar Aaronson, Louis Gimm, Frederick the Swiss, J. W. Nawn, Burns Pierce, Frank Alberts, Ed Stevens, John Chapman, Tom Barnaby, Charles Turville, Henry Pilkington, W. D. Elkes, Charles Ashinger and others. Charles Miller and his trainer John West will join the party at Chicago, and Jimmy Michael and Al Weinig, his new trainer, both of whom are now in New Orleans following the horse racing, will meet them in San Francisco, while E. C. Bald, accompanied by Tod Sloan, will be there to welcome the crowd. There is a large party of sprinters already in training on the coast, including Floyd McFarland, Orlando Stevens, Howard Freeman, Charles Wells, Clinton Couler and Bob Terrill.

## Prince Promoting Texas Circuit.

Jack Prince has been in Texas trying to interest the capitalists and riders there in his southern circuit plans and has apparently met with encouragement. He proposes to build fine race tracks in

Galveston and Houston, and would include in his circuit, besides these two cities, San Antonio, Austin, Waco, Ft. Worth and Dallas. The circuit is to start in New Orleans about the 22d, when a big meet is to be given, and the route is to be covered two or three times, after which some of the riders will continue on to the Pacific coast to enter the spring races there. All the races on the circuit are to be held under the sanction of the Southern Cyclist Association, and it is Prince's intention to secure the presence of many of the best sprint riders in New York, including Earl Kiser, Arthur Gardiner, H. Steenson, Bob Walthour, Henry Eckert, Wallace Anderson, Ben Munroe, George Quinn, Tom and Nat Butler, the Kraemer brothers, Frank Starbuck, Will and Jack Coburn and Tom Cooper.

## LEAGUE POLITICAL AFFAIRS

**Sams Agrees Not to Run for Presidency—Mott Will Decline Reappointment.**

Baltimore, Jan. 16.—Thomas J. Keenan, Conway Sams and Albert Mott were in conference here last week and when the meeting was over it was announced that Sams had agreed to withdraw his opposition to Keenan's candidacy for the presidency of the League and would himself retire as the candidate of the Potter element. After carefully estimating the strength of each, Keenan and Sams found their support nearly equal, with one section in doubt. A joint telegram was sent to this place and the answer was favorable to Keenan, which decided the question of which was to retire.

It has been rumored that an agreement was also entered into at this meeting whereby Mott was to be reappointed to the chairmanship of the racing board, but on the following day "Uncle Jerry" positively declined to be a candidate for reappointment, saying that the duties of the office, added to his private affairs, have injured his health.

Keenan favors the appointment to the national racing board of men who are in close touch with racing interests. From remarks he has made it is inferred the chairman will be a man who understands the whims of riders and one in whom the outlaws can have confidence. Keenan hopes by finding such a man to make the way easy for the return of the outlaws. The committee which was appointed a year ago to consider the advisability of the League transferring the control of racing to another body will report at the Providence assembly that, since there is no association competent to take control, the League should retain it. For the appointment to the chairmanship of the racing board six men are prominently mentioned. They are: Fred Gerlach, Chicago; H. Robinson, Boston; W. R. Pitman, G. L. McCarthy and John Barnett, New York, and C. W. Mears, Cleveland.

No less than three amendments, from the representatives of as many different divisions, will be offered at Providence looking to the admission of professionals to membership, and should either of these amendments be adopted, which seems probable at this writing, one of the strongest cards of the anti-Leaguers will have been trumped.

The latest report of the French minister of finance shows that there are 534,000 cyclists in France.

## THE AUSTRAL WHEEL MEET

**Melbourne Mechanic Wins the Great Handicap of the Antipodes—Thirty Thousand Spectators.**

Sydney, Dec. 19.—The great Austral Wheel race three days' meet was concluded December 10 at Melbourne. Nearly 30,000 persons were present to witness the final of the Austral. The gate receipts for the three days amounted to more than \$12,500. The racing throughout the day was brilliant and exceptionally fast for a grass track.

The most important event was the final of the Austral, for which sixteen riders had qualified the Saturday previous. The first prize was \$1,200, second \$600 and third \$200. The race was a brilliant one all through. The limit men got together early in the race and pacing alternately defied the back markers to catch them. The final struggle was one of the best finishes yet seen at a cycling meet. T. S. Finnigan won after leading for the last three laps, W. Middleton was second, MacGibbon third, a foot behind Middleton, and Matthews fourth, half a yard back. When the field entered the last lap Finnigan rushed to the front at a terrific pace, with Matthews hanging on, and gradually they gained two lengths on the bunch of half a dozen following. Matthews tackled Finnigan half a length from home, but the latter shook him off and appeared to have the race won, when Middleton made a wonderful rush and came up with Finnigan. A great race ensued. Middleton's wheel once or twice showed in front, but he got pocketed and bumped, which spoiled his chance. Finnigan with a mighty effort landed the race by a foot. Relph, the Englishman, who started favorite, finished last. Time, 4:30 4-5.

Finnigan is employed as a cycle mechanic in Melbourne and rode a Canadian machine.

Walne won the ten-mile scratch race by two lengths from Miller and Forbes. There were thirty-eight starters.

The Victoria mile race was taken by Crisp of Tasmania from forty yards, while Campbell won the flying stakes. Ken Lewis fell and broke his collar bone.

The summaries are as follows:

Two-mile Austral handicap—T. S. Finnigan, 220 yards, first; W. Middleton, 190 yards, second; G. MacGibbon, 230 yards, third; W. Matthews, 260 yards, fourth. W. C. Jackson, T. Relph, J. B. A. Gargurevich, A. E. Tame, W. B. Taylor, E. E. Fontaine, W. L. Clinton, T. Amos, J. Brooker, W. Stapleton and A. W. Bennet also started. Time, 4:30 4-5.

Ten-mile scratch—R. H. Walne, first; C. E. Miller, second; A. C. Forbes, third. Time, 24:35.

One-mile Victoria handicap—A. B. Crisp, 40 yards, first; A. J. Berry, 65 yards, second; S. E. Gordon, 90 yards, third. Time, 2:11.

Half-mile flying stakes, final heat—J. Campbell, 50 yards, first; P. Bazely, 65 yards, second; J. Esler, 50 yards, third. Time, 1:02 4-5.

## First Popular Good Roads Vote.

Complete returns of the Minnesota state election show that the state aid amendment to the constitution has been passed by the people by a vote of 70,043 to 38,017. This is the first time that a popular vote has ever been taken in any state upon the good roads question and the result is a most emphatic indorsement of state aid as its solution. The constitutional amendment was introduced at the 1897 session of the Minnesota legislature by A. B. Choate of Minneapolis, as representative of the L. A. W., and its passage by that body was the result of his persistent and diplomatic work

in behalf of the measure. This left it to be submitted to popular vote for its final passage. A strong educational campaign for good roads was carried on by the L. A. W. throughout Minnesota during the past summer and fall with the active assistance of the Bureau of Road Inquiry at Washington and the press of Minnesota. The Minnesota legislature will now take the necessary steps to put a system of state aid in operation such as is now in force in New Jersey and in New York. Farmers especially will appreciate this, as it will enable them to obtain durable highways without being obliged to bear the entire expense, as they do at present.

**Algerians Cheer the "Flying Yankee."**

George Banker, popularly called the "Flying Yankee" by the Frenchmen, was the star attraction at the big meeting in the city of Algiers on January 1, which was attended by a large and cosmopolitan crowd of spectators. Grogna, Banker and Tommaselli qualified in the three heats of the handicap race. The final was a regular scratch race. The three loafed for the first half lap, but the crowd began to hiss and Banker went to the front, where he staid until the finish, resisting every effort of the others. Four heats of the Algerian championship race were won by Grogna, Banker, Tommaselli and Guignard, Banker winning his heat by thirty meters. The final was to have been run January 8.

**Rebellion Dying Out in Colorado.**

The Denver Wheel Club has sent in applications for membership in the L. A. W., and a Denver daily paper states that the League will assume control of racing affairs in Colorado next spring. The disaffection last summer was due, it says, to a small but powerful combination of Denver cyclists, and gradually the sentiment against secession and separate control has gained ground until there remain in Colorado few sympathizers with the cause of rebellion.

**NEWS IN BRIEF.**

Arrangements are being made for a four-days' indoor race meet in Baltimore to be run the last part of January.

G. G. Webber of Toledo is credited with having won the Century Road Club mileage for last year, having ridden 37,500 miles, which is far in advance of that made by any other rider.

Wisconsin wheelmen will ask the state legislature at the present session to pass a special statute providing a penalty of six months to two years imprisonment for bicycle stealing.

George Gideon, ex-chairman of the League racing board, denies that he favors W. R. Pitman for chairman of that board, and says that he thought the suggestion was one of Pitman's jokes.

Councilman Bell of Tacoma has prepared a bill for presentation to the Washington state legislature authorizing the cities to regulate and license the riding of bicycles and use of other vehicles and to build cycle paths.

A bicyclist who had just ridden 108 miles in eight hours died at Binghamton, N. Y., recently. An autopsy disclosed the fact that the victim's organs were all in a perfect condition. It was simply a case of exhaustion.

D. R. McLachlan went for the amateur paced records at Johannesburg, South Africa, December 3, and did the quarter-mile in :24 1-5 and the mile in 1:52 2-5. The American quarter-mile record is held at :24 by E. A. Morass, made in Detroit in November, 1897, and the one-mile at 1:43 2-5, made by H. G. Gardiner, at Willow Grove, September 11, 1898.

Harry Leo of Sioux Falls, S. D., rode into New York city last Friday, having made the round trip from New York to San Francisco and back since June 1. He said he reached the Golden Gate September 4, having broken the New York to Denver record en route,

the trip having been made in fifty-one days. He started on his return ride from the coast on September 6.

Mrs. George Bunker of Chicago has won the Century Road Club mileage for women riders for 1898, having ridden 18,458 miles during the year.

Joe Downey of Boston is the first person to apply to the National Cycling Association for recognition of a racing record. He filed a claim with A. G. Batchelder, chairman of the board of control, for his amateur paced half-mile of :59 2-5 made December 31 last.

Major Taylor is vacillating on the question of going to Europe next spring. He has had a longing to go ever since his phenomenal work on the national circuit, but has been deterred by various considerations, one of the chief of which is the fact that most of the big race meets take place on Sunday in France. While in Chicago last week, however, Major Taylor said he would go into training as soon as the New York cycle show is over if the weather permits and will leave for Europe when he gets in good form. Upon arriving he will train another two or three weeks and then go for European mile and kilometer records from the quarter-mile and third-kilometer to the hour. His chief ambition is to defeat Bourillon in an open race or match event. He will return to America in time to compete at the world championships in Montreal.

VOL. XXII—No 13.

CHICAGO, JANUARY 26, 1899.

NEW SERIES No. 62.

### HUMBER COMPANY IN COURT PETITION FOR RECEIVER FILED

#### Goodrich Company Charges Fraud and Secures Injunction—E. T. Hooley Brings Suit.

The final chapter in the affairs of the Humber Company, Limited, of Westboro, Mass., is being enacted in the courts of Massachusetts, which have been petitioned by the B. F. Goodrich company, one of the largest creditors, to appoint a receiver for the concern, and in which three separate suits have been brought against the company and its manager by the Revere Rubber company, William Allen & Sons and E. Terah Hooley. The property of the defendant company was attached by the sheriff January 17 at the instance of the Revere Rubber company; and Albert E. Hawksley, and Charles T. and Arthur H. Russell were enjoined upon the petition of the Goodrich company from transferring the property and selling the stock of the Humber company and from collecting on the claims against the company.

#### Suit Has Many Respondents.

The Goodrich bill in equity was filed in the Superior Court January 17 against Humber & Company, America (Limited), with Arthur R. Marten and Frederick Goddard, trustees, under the head of Humber & Company; Albert E. Hawksley, First National Bank of Westboro, Charles T. Russell, Arthur H. Russell and Thomas H. Russell, named as the other respondents. It is claimed in the bill that Albert E. Hawksley, who recently came over from England in the interests of the English capitalists who own the concern, and who is now active manager of the company, has taken possession of the assets of the company, claiming to represent Marten and Goddard, the trustees. The Humber Company is indebted to the B. F. Goodrich company in the sum of \$2,272 for goods furnished and delivered, as claimed.

#### Charges Fraudulent Transfers.

The petitioner alleges that a deed of indenture or declaration of trust upon the property of the defendant is claimed to have been executed between the Humber company and the defendants, Marten and Goddard, to secure the payment of 250 bonds for £100 each, 25,000 English pounds sterling. The Goodrich company states further that the execution was never authorized by Humber & Company; that no bonds were given, and that the instrument is a part of a scheme devised to protect the English stockholders of Humber & Company at the expense of the creditors. The shares of Humber & Company, America, are all held by persons in England.

It is alleged in addition by the Goodrich company that Elliott Burris, general manager of the company previously, has been removed from his position, that the attitude of the company towards the creditors has suddenly changed, and that payment of all indebtedness has suddenly stopped. The property is being sold and converted into money, and all outstanding indebtedness to the defendant company is being collected, for the purpose of taking the same out of the jurisdiction of the courts, as is claimed.

The Goodrich company believes that Mr. Hawksley has fraudulently prevented the creditors from obtaining possession of the assets, and has deposited money in the First National Bank of Westboro, and assigned the same to Charles T. Russell and Arthur H. Russell, of Boston.

The plaintiff prays that the court declare the mortgage or deed of trust null and void, and that a receiver be appointed to settle the affairs of the concern for the benefit of the creditors.

#### Company Promoter Sues for Commission.

Hooley's suit is brought in the same court against Elliott Burris to recover commission which he alleges is due him for the floating of the scheme of the Humber company before the English capitalists. Mr. Hooley claims that this commission, which was agreed upon, has never been paid to him by Mr. Burris.

Mr. Hooley has brought another suit for commission, and the members of the company itself, according to statement of counsel, have turned the tables and sued him for return from the sale of the stock of the company among the English speculators, which they claim is still due from him on account. The amount at stake is from \$5,000 to \$10,000.

The Revere Rubber company is another plaintiff who is suing the Humber company for materials delivered. The property of the defendant company held in the name of Arthur R. Marten and Frederick Goddard was attached in the sum of \$1,000.

### THE RIGHTS OF CREDITORS

#### BANKRUPTCY ACT DECISIONS

#### New Law Leaves Affairs of Bankrupt in Creditors' Hands With Referee in Charge.

Buffalo, Jan. 23.—In an address to the Credit Men's Association of this city, at a meeting held last week, Referee in Bankruptcy Hotchkiss cited the following recent decisions handed down by the courts bearing on the new bankruptcy law on general assignments. The intention was to show that the effect of the law is to favor the creditors.

The decisions of three federal judges, in districts in New York, Missouri and Virginia, he said, were all in favor of the creditors, and go to show that they, backed up by the bankruptcy law, can set aside a general assignment, and handle the debtor's affairs, with fairness to all concerned. These facts are important to the credit men of the country, and these decisions will undoubtedly cause general satisfaction among them.

#### Opinions of New York Judges.

Judge Cox, of the northern district of New York, holds the following opinion on the subject:

While the state assignment law allows the property of the debtor to remain practically in the charge of the assignee and his attorney, the bankruptcy law leaves the affairs of the bankrupt in the hands of the creditors, looked after, of course, by the referee in bankruptcy.

Judge Brown, of the southern district of New York, in a recent decision has the following to say:

Upon such an assignment, creditors are authorized to proceed instantly against the debtor as under the old law. Careful provisions are made in the present statute for these involuntary features, and for preserving this right of procedure; and if, notwithstanding these provisions, a voluntary assignment could stand valid as against the trustees in bankruptcy afterwards appointed, the whole object of declaring such an assignment to be an act of bankruptcy would be nullified. In that case, though the creditors invoking this express provision might immediately put the debtor into bankruptcy, they would thereby gain no control of any assets nor derive the least benefit from the bankruptcy proceedings; and while thus subjecting themselves to expense in the pursuit of their illusory rights, the only result would be to benefit the bankrupt by giving him a discharge for nothing.

Up to the 1st of January 500 cases have gone into the bankruptcy court of the northern district of New York state, and of that number less than half a dozen were identified with the cycle trade. This augurs well for the bicycle industries of this district, which embraces forty-seven counties, and in which territory is included Buffalo, Syracuse, Albany, Rochester and several other places where bicycles are made.

## BRAZING BY IMMERSION

### Portable Furnace — Fire Regulation Semi = Automatic— Gradual Heating of Work—Boy Helper's Function

A dip-brazing furnace of a type different from those previously illustrated in Cycle Age is shown in operation in the large illustration below. The furnace is that made by the Chicago Brazing Furnace Construction Company and the view was taken in a brazing room in which the furnace is in constant use.

#### Grate Shakers Employed.

Two of the fundamental ideas actuating the builder of the furnace are that

work rests comprises the bottom of the fire box and holds the grates. The latter, instead of being of usual boiler or furnace construction, are arranged in pairs, which may be dumped to clean the fire from ashes and clinkers. The dumpings fall down through two square, box-like openings below the grates. The dumping facilities comprise segmental gears, one of which is secured to the hanging shaft of each grate section. The two gears of each pair of grates mesh with each other,

which allow cold air to strike the fire from above, and the work of cleaning out the fire and recoaling necessitates hardly a pause in the brazing operations. The absence of doors obviously does away with the possible danger of cracked door castings.

#### Replacement of Crucible.

The crucible rests on the end walls of the furnace and is also supported underneath at its center by buttress projections from the side walls. It is not cemented in place with fire clay, but is merely placed in position on its supports and left there until it is worn out; and replacement requires no work other than the removal of the old and the laying in place of the new crucible. The builder claims the further advantage in leaving the crucible unrestrained by fire clay or cement that this disposition allows the crucible end play for expansion under the action of heat, and he states that

"CHICAGO" BRAZING FURNACE IN OPERATION—BRUSH WHEEL FOR REMOVING SUPERFLUOUS SVELTER AT THE RIGHT.

a dip-brazing furnace should be so constructed that it may be moved without tearing down and that the furnace complete should not weigh enough to bar its usage on light upper floors of factory buildings. Accordingly, this furnace is built upon an iron table which gives it the general aspect of a portable forge, and it weighs not more than 900 pounds. There is no iron jacket inclosing the furnace, cast parts being used only in places where there is no strain, the intention of such disposition of the metal fittings being to avoid cracked and spoiled castings. The top of the leg-supported table upon which the firebrick

thus making it possible for the operator to shake both sides of each grate by manipulating the handle of either segmental gear. The coal is fed to the fires through openings in the side walls of the furnace, these openings being fronted by hoppers. The hopper is loaded with coal, which the operator then pushes down into the fire box by means of a poker.

The use of grate shakers instead of a poker for the purpose of cleaning out the fire removes the necessity of doors in the furnace walls. Removal of the lid of the hopper when it is desired to add coal to the fire thus affords the only occasions

this expansion amounts to about one-half inch over its original size.

A long single piece tile about four inches thick is used to cover flame passage at each side of the crucible and force the heat laterally across the top of the spelter.

#### The Blast Arrangement.

As will be noticed from the large illustration, the draft inlet pipe is divided into two branches, which enter the furnace at the side, one branch leading to each end of the fire. The blast strikes a fire of good depth, the crucible at its lowest point being about five inches above the grates. The regulator is the

ordinary cut-off slide. An ordinary fan blower, fifteen to nineteen inches in diameter, will give the proper blast for the furnace.

The particular furnace illustrated in operation is used for brazing crank-hangers which are built up of several

brazers. The vigorous brushing thus quickly given the bottom of the hanger, to which the largest bulk of the superfluous spelter has naturally run, leaves the brazed part free from lumps and clots of spelter and with a thin, even film of brass over its entire surface.

hand. A plate of iron is kept over the central part of the crucible, resting on the cover-tiles and leaving only the ends of the crucible entirely open. On the iron plate the boy keeps at all times about six or seven hangers which the heat and flame rising about the iron plate heat to a temperature which, while it is not a brazing heat, is still sufficient to protect the hangers against the possibly injurious effects of plunging absolutely cold metal into the molten spelter, and to prevent the spelter from losing heat through the introduction of cold parts. As soon as the boy has taken one hanger from the plate and floated it upon the material in the crucible, he replaces it with a cold one, and thus has constantly on hand a stock of warmed hangers. The time occupied by the boy in supplying heated hangers is about equal to that consumed by the brazer in dipping the parts, so that the work goes on very regularly and without lost time on the part of either operator or helper.

Good anthracite coal is recommended for use in the furnace in preference to coke, as it is said that the latter, while it gives a very satisfactory fire, tends to burn out the grate bars more rapidly than coal.

#### Canadians Will Not Exhibit.

The Canadian manufacturers of bicycles and bicycle sundries have decided not to make any exhibits at the World's cycle show, as the exhibition to be held in Montreal under the auspices of the World's Championships Club is called.

#### Frontenac Company Reorganized.

At a meeting of the stockholders of the Frontenac Mfg. Co., of Syracuse, N. Y., held last week, the company was reorganized and several of the original stockholders retired, new parties having acquired their stock. One of the largest stockholders is now George M. Barnes, who was elected president for the ensuing year. The other officers are Austin R. Dickinson, vice-president and general

FURNACE ASSEMBLED READY FOR USE.

pieces and brazed together before assembling into frames.

The brazing of these parts by the immersion process is highly advantageous, even without taking into consideration the matter of economy. The stamped pieces which compose the hanger give what a brazer using the flame method would call a "hard job," and one requiring much care that all of the parts may be thoroughly brazed. With the immersion furnace the work becomes as easy and sure as though the joint were the simplest lug connection.

#### Duration of Dip Shortened.

While the work may be done by one man, the operators of this particular furnace have devised a plan by which the work may be sped and its quality improved by the employment of a boy helper. His duty is to stand at the end of the crucible opposite to the brazer and place in a floating position one hanger at a time upon the surface layer of flux above the molten spelter. He pushes the hanger he has floated on the flux toward the opposite end of the crucible, where the operator grasps it with a pair of long tongs, the jaws of which catch the hanger by the seat mast lug. The operator then slowly and steadily lowers the hanger till it is properly immersed in the spelter and as slowly withdraws it, allowing it to remain in the brass for a few seconds only.

#### Cleaning by Steel Brush.

After tipping it in various directions to allow as much of the adhering spelter as possible to drip back into the crucible, the brazer performs an operation on the hanger which is not common shop practice, but which is very effective and which requires only a very few seconds of time. The operation consists simply in holding the still heated hanger against a rapidly revolving steel brush wheel mounted on a regular grinding wheel arbor and placed in close proximity to the

The revolution of the brush wheel is in such a direction that the brass brushed from the hanger will be thrown upward and away from the operator and against a metal screen purposely erected to stop the spelter thus thrown off by the wheel. The brushing wheel is easily recognizable in the large illustration.

CAST IRON FRAME FOR "CHICAGO" FURNACE.

After brushing, the hanger is laid aside to cool, and is ready to have the coating of brass removed.

#### Regular Progress of Work.

The boy who floats the hangers onto the contents of the crucible does not take his parts directly from the cold stock at

manager; E. D. Dickinson, treasurer, and C. C. Barnes, secretary. The board of directors is composed of the same men, with Hendrick S. Holden as a fifth director. The capital of the company, \$75,000, is to be fully paid up with increased capital, and the business is to be vigorously pushed and extended.

### COMPRESSED AIR VEHICLES

The bicycle and motorcycle industries are naturally watching with much interest and anxiety the sky-rocket display of syndicate formation for exploiting condensed air motors, which is at present attracting popular attention, and of which an account is given on another page of this paper. Although the convenient corporation laws of New Jersey seem to be much in requisition in order to swell the nominal capitalization of the projected monopoly and other indications are not lacking to show that eventual greatness is being freely discounted in advance, there is yet sufficient solid substance in the schemes to suggest careful examination of the possibilities of compressed air motors for use in motor vehicles and their probable influence to assist or retard the manufacture and sale of electric, steam and gas engine carriages.

From the description given of the compressed air motor it is at once apparent that vehicles propelled by such motors are of much more limited range than any of the three other forms. They depend upon supply stations to such an extent that makers of steam and gas engine vehicles may feel assured of their absolute safety against competition from this new source. In so far as the compressed air vehicles are intended to be operated on common streets and highways without the necessity of rails, they will, in proportion to the favor which they may gain, serve to popularize the automobile idea in general, and by their evident limitations will force the demand for automobile vehicles in the direction of those driven by steam or gas whose range of travel is practically unlimited.

With regard to electric vehicles the case is somewhat different, as these depend upon supply stations for their driving power. But a very essential factor in favor of the electric system for most styles of carriages is observed. The compressed air motor requires for operation not only a plentiful supply of air bottles, which under an internal pressure of 4,000 pounds to the square inch are not quite exempt from the possibility of explosion, but also a reservoir holding water which is heated, under pressure, to 400 degrees and which, however well protected against loss of heat by radiation, gradually cools until a temperature is reached with which the motor cannot be successfully operated. In other words, the power stored in a compressed air carriage must be used within a given time after charging. If it is not, the reheater must be supplied with superheated water again.

Evidently this new limitation removes the compressed air motor from consideration as a competitor with all electric vehicles which are not designed to run on schedule time.

For private carriages and for cabs, which must await their chance for hire, the electric system has nothing to fear from condensed air until the necessity for reheating the air shall be removed.

It seems likely, of course, that the reheating is an economical as well as a mechanical requirement, but at the present stage of general information intrinsic evidence points to the need of reheating not only for the purpose of securing additional expansion of the air but also for that emulation of oil in the air which the nature of air motors seems to require. The projectors of compressed air schemes would hardly incur their

machines with the reheater if they saw any manner of avoiding it, even at increased operating cost.

The sum of considerations which may be urged in favor of condensed air—with the most liberal allowance or the substantial character of the multi-million companies which are being formed—seems to settle the position of compressed air motors, commercially and mechanically, as one that involves possibly a very strong competition with all other systems for operating street railway cars, bus lines and schedule traffic in general, and, further, one of great promise for heavy trucking within the yards of large manufacturing establishments, in railway freight yards and at docks and quays; but, on the other hand, one which contains no vestige of danger to the development of other branches of automobile industry and may materially assist in popularizing electric carriages as well as steam and gas engine vehicles for private use and for cab service in cities.

### LOCAL SHOWS ONLY

From reports at hand it is evident that the managers of the New York cycle show have been equally as incapable of maintaining the character of a National exhibition as the Chicago people, and this in spite of the most favorable opportunities in regard to the housing of the affair and the co-operation of prominent bicycle manufacturers who thought the occasion suitable for displaying motor vehicles.

At both shows the automobiles have proved the drawing card and to them has been given nearly all the publicity that Chicago and New York papers have accorded the two enterprises.

Measured in column space in daily papers, the advertising which the trade in its entirety has received through the shows has been about one-twentieth of that given at shows in former years, and measured in value as a stimulant for purchase of bicycles by the public this stinted publicity may have done more harm than good, by showing to all who cared to read right that the newspaper reporters are unable to find anything in bicycles on which to build up an article of popular, readable interest.

Considered as local shows both occasions, however, have had their meed of success, if by a local show is meant a sort of bazaar where manufacturers may place themselves in touch with the local retail trade. But it still remains very doubtful whether the other object of local shows has been attained, viz., that of laying a foundation for better local retail trade than could be secured by other, perhaps more economical, means.

So long as this point remains doubtful it seems clear that local shows which may be arranged in other cities between now and the opening of the riding season, should under all circumstances be managed on such a plan that the promoters and the exhibitors take equal chances on arousing that interest in the public which finds its expression in gate receipts. Where the exhibitors are practically also the managers as at the impending Philadelphia show, this is cleverly effected by auctioning off the spaces. And at the projected Denver show, it is understood that spaces will be free for exhibitors.

Against such inducements the one-sided arrangements which have been in vogue in New York and Chicago and by which the trade has borne all risks while guaranteeing the show managers a profit before doors were opened, have been made impossible for the future.

Thus it may be considered the upshot of all efforts which have been made for reviving national cycle shows, that the trade at large has realized their futility, and that henceforth local shows will alone be supported.

Further than this, local shows must be supported chiefly by the public at large through gate receipts and not by the trade through space rent. If they should fail to prove profitable with gate receipts as the only source of revenue for the show managers, the trade will abandon them.

### CREDIT IN FOREIGN LANDS

If a retail dealer in a foreign country, who desires to carry American bicycle goods, were to go to his local bank in order to borrow money wherewith to pay the American manufacturer or exporter the cash usually demanded in American export trade, he would as a rule have no available security to offer. According to ordinary banking methods, his note would not be accepted without substantial en-

dorsement. The stock of American goods for which he is negotiating cannot be used as security, partly because it has frequently not arrived when the money is required, and partly because a chattel mortgage on retail stock is a prejudicious instrument under which no self-respecting merchant desires to operate.

Under these circumstances it is plainly the most probable result that the foreign dealer either abandons his desire to carry American goods or chooses to purchase them from the English or German importing house which is prepared to allow him credit. It matters not to him that the English or German seller immediately negotiates his paper with the local bank. The fact that the seller is capable of negotiating the paper is what brings him the trade; and the fact that the American manufacturer or importer who attempts to deal directly is unable to negotiate the paper with a local bank is the chief reason why direct American export is handicapped and limited to transactions with foreign jobbers and dealers of the first magnitude who are prepared to advance cash of their own resources.

In this condition of affairs, which applies with the greatest force to trade with Southern Europe, South America and Mexico, and all of Asia and Africa, there is of course an element of conservatism which protects our exporters against losses which might arise from failure to collect accounts, but it works, as is now well known, as a heavy embargo on the American manufacturer by taking his export trade out of his own control and making the foreign middleman the master of the situation, not only in regard to the quantity of trade but also largely in regard to prices.

If foreign local banks were in the habit of purchasing accounts outright without recourse to the seller in case of trouble in collecting, American firms might undoubtedly make satisfactory arrangements. But such is not the case. They act chiefly as collecting agencies, getting their security for money advanced on the local collaterals, through confidential relations with European banks to whom the standing of the seller is known.

If they maintained similar relations to American banks and were imbued with confidence in American financial institutions, the principal difficulty would be removed, and American export trade could then progress on a more profitable basis and especially with greater assurance of regularity than it does now. To continue it and broaden it, as in the bicycle and allied industries, with low prices as the principal inducement, is a hazardous system which tends towards constant whittling down of profits.

How much longer this system can be followed appears at present very problematic. From all sides, and especially from American consuls abroad, comes the constant cry for credit, longer credits and direct dealings, notwithstanding the fact that the total absence of American banking facilities in Southern Europe, South America and nearly all colonial countries makes the extension of credits extremely inadvisable at the present time.

It seems sometimes as if the consuls and others who never tire of repeating this demand for longer credits fail to realize how impossible it must be to comply with it until the local banking institutions in all parts of the world where we desire to trade shall have made fiduciary connections with some American bank of international reputation which, in turn, shall be prepared to assume a moral or real responsibility for the exporter's business methods.

Unless some readier method is devised for bringing about this result than the proposed establishment of large exchange banks operated with American capital and located in the various cities of foreign trade, it is to be feared that it will take a long time before our manufacturers will be enabled to give credit to foreign buyers.

United States has too recently stepped out from the ranks of colonial countries herself to have much capital available for foreign banking enterprises and our manufacturers are not so well capitalized that they can afford to carry large credits with non-negotiable papers.

\* \* \* \*

The closer the margin of profit in bicycle production becomes, the greater is the need of a cool business capacity of the

first order at the head of each concern and of perfect subordination to his designs in its internal economy. It is this necessity which has always wrought havoc with co-operative concerns when their aim was profit. Business discipline is foreign to co-operation, but necessary for economical and capable management. There has never been a purely co-operative concern whose head became its master by natural selection, if he became its master at all. But it is by the process of natural selection that men and institutions go to the wall or climb to success. It would be a miracle if the co-operative bicycle factory planned by President Mulholland, of the International Union of Bicycle Workers, should be an exception. It is likely to crumble by its own weight before it is started going. Its officers would of necessity be labor agitators instead of business men. Its lease of life would be determined only by the time which it would require to eat up the capital to be contributed for its support. Mulholland does not propose to sell bicycles very cheaply, but will rely on the patronage and patience of "three million organized laborers" for obtaining a good selling price, offering in return the assurance that only good material and good workmanship will be employed. He offers his intentions of dealing fairly as a substitute for capacity to deal intelligently, but there is nothing in the past history of co-operative work to indicate that this ingenuous offer will be accepted.

\* \* \* \*

It is comparatively easy to obtain statistic information in regard to the numbers, styles and grades of bicycles which are sold each year by manufacturers of the first and second rank, but to ascertain the quantity and description of bicycles which issue from the small builders' shops, baffles the most assiduous efforts. In the discrepancy which thus arises between sales known and sales actually made, lies the explanation of several confused theories that have been propounded with much assurance. It was said that tandem riding was on the decline, but it has been all but proved that tandems have been built during 1898 on a very large scale for local trade, and dealers generally contend that tandem riding is on the increase, but that those who buy tandems prefer to have them made to order under their own supervision. Bicycle manufacturers on the other hand maintain more and more that tandem building interferes too seriously with the more profitable routine work in their factories.

\* \* \* \*

Another "fact" gleaned from available statistics has it that the increase in the production of women's machines for the 1898 market amounted to nearly forty per cent—out of all proportion to the increase in production of men's bicycles. The explanation is probably the same as that applied to tandems, although it may not hold good to the same degree. But, undoubtedly, drop frames are sold over the counter almost exclusively, while a considerable percentage of men riders showed a preference for the local maker's product during the past year. In the future it is, of course, most probable that the lower prevailing prices will materially reduce the local builder's output; but he is not at the end of his rope yet. With the aid of the parts maker and by refraining from employing hired help, he may yet give the large maker a tussle for existence for some time, and the observation which is of interest in connection with his struggle is just that which refers to the preponderance of men's bicycles and tandems in his output. It seems to point to the advisability for the large manufacturer of allowing a larger increase in his production of drop frames than he ordinarily would figure on and of devoting more than usual attention to their equipment, so that he may overcome competition in that branch which shows the largest sales.

# OUR BEVEL GEAR CHAINLESS BICYCLES

are the result of actual experience and practical use in 1897 and 1898, and previous years of experimenting. Our '98 models proved satisfactory and servicable. We have improved them at many points. Their weight has been reduced without sacrificing strength, and we are convinced that they are the best adapted of all bicycles for use at any time, on any road, and under any conditions.

PRESENTING TESTIMONIALS.

MILWAUKEE, WISCONSIN, Nov. 28, 1898  
MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen—I purchased one of your tires July 17, 1898, and have ridden it constantly, averaging twenty miles per day. I find the tread of your tire perfect in construction and far superior to anything I have ever used, and highly recommend it to the Cycling World. Respectfully,  
(Signed) GEO. A. WILLISTON.

FRANK G. VILLA, Manufacturer of "THE MARS" BICYCLES.  
WINONA, MINN., June 7, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen—I have sold several pairs of your tires among the better class of riders here, and can say that everyone without exception is more than pleased with them.  
I put a pair on my own wheel and filled a board with lath nails, points up, projecting through the board 3/4 of an inch and have ridden over it continuously since April 1st and have not punctured them yet. Yours truly,  
(Signed) FRANK G. VILLA.

## NO FEAR FOR GERMAN TRADE

### Causes Expected to Nullify Efforts of German Makers to Kill American Competition

American bicycle manufacturers are very little concerned over the latest move of the German makers to stifle the trade in American bicycles in the Fatherland. The general opinion seems to be that the 100 manufacturers comprising the German Bicycle Manufacturers' Association have, by unanimously deciding to refuse further credit to dealers in Germany who persist in handling bicycles made in the United States, simply given further evidence of the fear with which they view the competition of American machines with the German in the home market of the latter—a confession that implies the superiority of the American product at prices as low as those of the native made goods, or lower. The German manufacturers seem not to have taken into consideration the important fact that such an admission on their part will tend to increase the demand of the public for the American goods, and that what the public wants it will have. All the agitation against New World bicycles and the efforts made to diminish the number imported have apparently had no effect whatever, our exports to Germany at the present time being larger than to any other country and having increased from \$1,147,776 for the first eleven months of 1897 to \$1,411,961 for the same period of 1898.

#### Dealers Likely to Resent Coercion.

Another factor to be reckoned with is the independence of the German dealers and the natural antipathy of man to be coerced. German dealers are accustomed to purchase stock from the United States for cash against bills of lading, and while the refusal of credit from the German makers may cripple their capacity for a large volume of business temporarily, the effect may reasonably be expected to be that some of the dealers at least will conclude to do all their business with foreign makers and supply their customers with goods that are in great demand. These will be substantial tradesmen, with ready capital to invest, and the American makers will benefit directly from such action.

Some bicycles made in the United States are shipped to German jobbers who put their own name-plates on them and dispose of them to dealers who ask no questions as to where they are manufactured. German makers would find it difficult to trace the source of these goods and to place the dealers handling them on their list of credit ineligible.

#### Agreement Will Soon be Broken.

All this is presupposing that the German manufacturers can successfully maintain their agreement. Where competition is so keen the tendency to surreptitiously take advantage of the compact and seek increased trade by offering inducements denied by the others is very great, and experience has shown that agreements of this sort are seldom adhered to long.

The opinions of some of the leading manufacturing companies of the United States on the subject and the effect the action is expected to have on their export business are given in the following letters:

#### Action Admits American Superiority.

The action taken by bicycle makers in Germany admits on the face that German bicycle makers are unhorsed—that they are

floundering about and know not which way to turn. They are beside themselves and have done that which lays them open to attack from the enemy. Their action admits that although the American bicycle must travel 4,000 miles, that although it is made with more expensive labor, and is handicapped by all of the insurance, boxing, brokerage, customs and other expenses necessary to put it upon the German market, the Germans are afraid to compete with it. This is on its merits. The German people want the best they can get for their money.

OVERMAN WHEEL Co.

#### German Makers Will Break Agreement.

The course that is being taken by the German bicycle makers has been carefully noted by us and after duly considering the matter we cannot see anything about it that is at all serious or that is apt to hamper the American manufacturers in the least. We enjoy a very satisfactory trade with both Germany and Austria and would dislike very much to have anything come up that would interfere with it, but we do not believe that any combination of German makers can prevent bicycle dealers in Germany from handling American goods if it pays them to do so. In the first place an arbitrary stand of that kind on the part of the makers will be certain to result in their losing the respect and patronage of the dealers. The average dealer in this or any other country cannot be coerced in any such high handed manner. Another reason why such a thing in our opinion will fail to accomplish anything is because no such agreement among makers will be sustained. We do not believe that the manufacturers in Germany are any different from those in this country, and we are quite satisfied that no such arrangement could be maintained among manufacturers in the United States. Just as soon as any such agreement was formed there would always be some ready to take advantage of the situation and break the agreement to their own profit. As soon as the others found it out they would all break and run for the business, with the result that competition would be sharper than before. These kind of things look very serious on paper, but in reality we do not think they ever amount to anything or accomplish in the slightest degree the object sought. An increased tariff on American bicycles shipped into Germany would certainly be felt heavily by all American makers of trade connections in Germany, but we do not think that the German makers can in any way interfere to any great extent with the sale of American bicycles in Germany through any trade combination or agreement.

NATIONAL SEWING MACHINE Co.

#### Public Will Demand American Bicycles.

While on the face of it the action of the German bicycle manufacturers to stop the importation of American wheels into that country may appear to be one which will prevent any German retailer from handling American goods, we do not think it will have this effect, as the bicycles made in this country are so superior to those of any other country that the public will get them in one way or another; and from what we have learned through your valuable paper and otherwise, we believe export orders for German territory are coming in at the usual rate. It has not so far had any effect on our business nor do we anticipate any serious falling off in our German orders.

KEATING WHEEL Co.

#### Action Will Prove a Boomerang.

We have your favor of the 20th inst., in reference to the restrictions placed upon the bicycle dealers in Germany by the home manufacturers. In our opinion the policy of the German bicycle manufacturer will place the independent dealer with capital to back him in a position to sell larger quantities of American bicycles than before and will create a prejudice against the home industry among their own people. It seems to us that the German manufacturers have vainly fought against progress and competition and are now trying to protect themselves with a Chinese wall as a last resort. We do not believe that they will win, but on the contrary we are convinced that they will be beaten.

LEAGUE CYCLE WORKS.

#### Dealers' Independence Should Assert Itself.

We were cognizant of the action proposed by the German cycle manufacturers, but are hardly prepared to prophesy as to the effect which their decree will have on the Ameri-

can trade in Germany. From our individual standpoint we do not believe it will affect us to any extent. We do a good, healthy business with several large German customers and do not expect that there will be any falling off in their orders. We do not know, of course, just how the German cycle dealer will look upon this matter, but if the American manufacturers in any line resorted to such methods to shut out German products we firmly believe that the spirit of independence which prevails in this country would increase the German trade rather than retard it. We hope that the composition of the German cycle dealers is of the same stuff and that they will make it so unpleasant for the German manufacturers as to compel the annulling of the decree.

WALTHAM MFG Co.

#### Jobbers Can Extend Credit.

We are very little concerned regarding the action of the German bicycle manufacturers, as we do not believe any such action could be effective in any manner. The trade we have reached in Germany has been about three-fourths jobbers, and of the machines we have exported the other one-fourth has gone to German manufacturers themselves, who have put our machines out under their own name plates. We do not conceive that in this latter case this action will amount to anything. In the case of the jobbers, the conditions in Germany are very much as they are here. The jobbers put out the machines we manufacture under their own name plates and the manufacturers are not known in the transaction between the jobber and retailer at all. It would seem to us that it would require a special detective force on the part of German manufacturers to ascertain whether or not any number of dealers were handling American bicycles. If the jobber extends the retailer credit, the manufacturer would be out of the game anyhow. The reported action has not interfered with our shipments to date.

BEEBE MFG. Co.

#### Quality Will Count in the End.

We can easily see how the attitude of the German manufacturers will result in shutting out a good many American made bicycles, although we are confident that the superiority of American goods over the German will more than offset the effect of the embargo. We do not see how American manufacturers can grant a system of credits to foreign dealers when the source of information in regard to financial standing of these dealers is so meager and hard to get. We adopted the policy ourselves of not allowing anything to go out of the country until it was paid for, and always in making foreign shipments to arrange for payments in New York against bills of lading. The large manufacturers who have regular established agencies on the other side can of course keep as close watch of local affairs as they can at home. We do not see how smaller manufacturers can do other than we are doing and be safe.

COLTON CYCLE Co.

#### Dealers Can Get Along Without Credit.

We would be of the opinion that the action of the German government would have no very serious effect on American trade in that country. If American bicycles are enough in advance of German made machines to sell in that market, we would think that a dealer might survive without a line of credit from German manufacturers.

ROYAL CYCLE WORKS.

#### Dealers Will Not be Dictated To.

We have noted carefully the action of the members of the German Bicycle Manufacturers' Association, in refusing credit to all retail dealers in Germany who handle American bicycles. We do not think that this will have the effect that the German Bicycle Manufacturers' Association intends it shall, as we do not believe the small dealers will be dictated to by the manufacturers in this manner. We expect to sell more bicycles in Germany this season than ever.

AMES & FROST Co.

#### Not Concerned by the Action.

What trade we have had in Germany has been on a cash basis, and we do not anticipate that the action of the German manufacturers will hurt us to any great extent. The demand there being almost entirely for cheap machines, we have never made any special effort for their trade, as we do not manufacture anything in that line.

DAVIS SEWING MACHINE Co.

#### American Makers Should Combine Also.

We think if American manufacturers would combine as the Germans have in regard to business done in that country, they would be very successful in competing with them on their own ground. American manufacturers have got to be sure that the people with whom they do business are entitled to a line of credit before making shipments of their goods.

THE OLIVE WHEEL Co.

**RAPID BEVEL GEAR CUTTER****BROWN & SHARPE'S PATENT****Radial Crown Gears Generate Bevel Gears of Any Angle by Automatic Planing and Abrading.**

Patents have been recently granted to Oscar J. Beale, of Providence, R. I., on gear cutting devices which are specially intended for cutting accurate bevel gears and pinions such as are used in bevel gear chainless bicycles. The patents are assigned to the Brown & Sharpe Mfg. Co.

**Intermittent Removal of Stock.**

The main feature of the cutting device is a generator in the form of a gear having the teeth scored, mutilated, or with portions removed to form edges or points arranged in varying relation to the pitch

surface so that they will remove the surplus stock from the surfaces of the blank teeth by merely rolling the pitch surfaces together without slip. In the application of the invention to the manufacture of bevel gearing the generator is preferably in the form of a crown gear, as such a gear may be conveniently cut and the gears or pinions formed by such a generator will run accurately with each other and form interchangeable sets.

The upper figure in the first illustration shows a preferred form of generator. The cutting surfaces of the generating teeth are roughened like files and will act to abrade or cut away the surplus stock of the blank by an action similar to that of a file. It will be noticed that the file corrugations are in-

clined one way on one tooth and in the opposite direction on the next, and so on around the generator. This arrangement of the cutting edges makes it impossible for any portion of the pitch surface of the blank teeth to be missed.

**Works on a Milling Machine.**

The lower figure in the same illustration shows the generator at work on a milling machine.

In the lower illustration another form of generator, in which the cutting edges of the generating teeth are formed by mutilating the several teeth differently so that one tooth takes away surplus stock

at one point on the blank tooth and another at a different point, and so on, is shown. The other sketch in this illustration indicates the operation of this form of cutter, though the principle, for sake of clearer illustration, is indicated as if applied to a spur gear generator.

**Subject of Importance to Exporters.**

The well known firm of Brown Brothers, Limited, of London, extensive dealers in cycle fittings and sundries, write to the editor, stating that three-quarters of the letters they receive from American houses bringing parts and sundries to their notice are insufficiently stamped so that the firm has to pay from 6 to 18 cents on each letter for postage due, the charge being double the amount of the insufficiency. Of late the firm has, for this reason, been returning unopened many American letters, being very properly unwilling to pay postage on them. Attention has been repeatedly called to this small but very important matter by American consuls, without any appreciable effect, but this advice from Brown Brothers shows such a direct possibility of loss to the senders of such letters that they will probably do more than dismiss the subject with a passing thought.

**Local Show for Washington.**

Washington, D. C., Jan. 23.—Cycle dealers here are taking much interest in the cycle show to be held during the week beginning February 27 under the auspices of the Bicycle Show company, composed of the representative local tradesmen, who elected officers as follows: L. B. Graves, president; J. D. Lasley, secretary; W. J. Foss, treasurer; John Woerner, manager, and Rudolph Jose, assistant manager. Practically all of the local dealers have closed contracts for exhibition space, and there are some out-of-town firms represented as well. Pope Mfg. Co., Overman Wheel company, and Duryea Mfg. company have signified their intention of exhibiting motor vehicles.

**Enjoined from Selling Factory.**

The litigation over the affairs of the Worcester Cycle Mfg. Company continues to drag out its weary length. The latest move is an injunction secured by the Central Trust Company of New York in the United States circuit court at Boston to prevent the proposed sale of the Worcester factory building by the mortgagee, the Worcester County Institution for Savings, to satisfy an account of \$80,000 due on first mortgage. The Central Trust Company holds a third mortgage on the real estate and property of the cycle company.

**Want Rex Co. Declared Bankrupt.**

Louis A. Levin, of Philadelphia, and W. T. Trowbridge, of Chicago, have filed in the United States district court a petition to have the Rex Cycle company of Chicago declared bankrupt. It is alleged that the concern committed an act of bankruptcy by favoring certain creditors.

**Relay Company Elects New Officers.**

At the recent annual meeting of the stockholders of the Relay Mfg. Co., of Reading, Pa., the present directors were re-elected for the year. They reorganized with the following officers: President, John R. Miller; secretary, Keyser Fry; treasurer, J. W. Minnig.

A new impulse has been given the cycle trade of Leesburg, Fla., owing to the extension of the clay road system comprising twenty-five miles of paved highways leading out of town in all directions.

**NIGHT WORK OF LITTLE VALUE****ONLY TWO ADVANTAGES GAINED****Profits Offset by Lower Working Capacity of Men and Poorer Quality of Workmanship.**

At the present time many of the manufacturing establishments of this country are compelled to work overtime. In some instances the extra work is performed by the day force during two or three hours in the evening; in others the pressure is so great as to require two separate gangs—one for day and one for night.

**Trade Retained by Fulfilling Contracts.**

There are practically only two advantages in overtime work—namely, getting the job done on time and thereby fulfilling the terms of the contract, and keeping the good will and trade of a customer, says Iron Age. A reputation for punctuality in the execution of an order is exceedingly hard to earn and far more difficult to keep, yet when once attained it represents good will of the greatest value. The second advantage has been illustrated forcibly in England during the past few months. The inability of the machine tool builders of that country to make deliveries when wanted diverted the trade abroad, especially to the United States.

**Overwork is Mostly Glory Work.**

Whether or not any advantage is secured in the form of increased profits through night work and its added output is a question to be answered differently in different lines. In some industries the profit is larger than it would otherwise be; but in others the augmented cost of producing is sufficient to wipe out the gains made during the day, and if this point alone is taken into consideration, the manufacturer has conducted his business for the glory and not for the cash there may be in it. Works running day and night may or may not be in the flood of prosperity—it depends essentially upon the kind of work turned out.

**Working Conditions Bad at Night.**

Inquiry among machine men shows a wide divergence of opinion upon this question. Its mechanical side is most diversified and interesting. The output is less, hour for hour, during the night. Perhaps the only exception to this is when the work is performed almost entirely by strictly automatic machinery, or when the work is of such a character that the operator becomes, by reason of constant repetition, an animated machine of the automatic type. In the ordinary machine shop, where the work is more or less varied, the output is invariably less at night. The conditions are different; the light is poorer, even in the best shops, and the man himself is tired and does not possess the vim and energy he displayed during the day. Some shops will not even attempt to do work at night which requires close measurement. Bench work of all kinds is less satisfactory at night, its very nature requiring the hours of the day for its proper performance.

**Comparative Working Capacity.**

It has been ascertained by more than one manufacturer that two gangs of men, equal in every respect, will not perform the same duty day and night. The superiority is always found on the side of those working during the daytime. This holds good in machine shops equipped with every modern appliance for doing work, and in shops in every way behind the time. The mechanical man is not a nocturnal animal—he is at his best only during daylight.

## NEW YORK CYCLE SHOW

### Suffers by Comparison With Former Exhibitions—Public Seeks Novelties—Review of Displays

New York City, Jan. 23.—As a spectacle intended to convince the public that the cycle industry is not in a state of decay, the show now in progress in this city—with its 107 exhibitors—is not of such a forceful character as to summarily arrest the growth of that evil opinion, if it be existent. For the function is meant in comparison with like exhibitions of other years, though a brave effort has been made to cheat the senses and compel a different belief by means of a generous use of theatrical properties. The attendance, which regularly is large in the evenings, in a measure atones for this.

As a mart of trade, where makers could secure orders from agents, the show betrays those people who fixed their hopes upon it. Though agents are by no means repelled by the exhibition, yet they are not powerfully attracted to it. The dealers of the metropolitan district are met with frequency in the show building, but it is seldom that buyers from remote parts are encountered, although a few have journeyed hither from the western parts of New York, Pennsylvania, the New England states, and a couple of the five southern states which are accounted profitable fields of work for bicycle makers.

#### Local Character Criticized.

Competent critics assert that the show is like its precursor in Chicago—local in character and influence. The few firms which undertook to give some of the old-time magnificence to the booths are put out of countenance at observing their propinquity to the rather shabby displays made by rivals. The crowds plunge in the direction of the exhibits which feed their curiosity. A new driving gear, any of the varieties, always provokes attention. The visitors are in attendance merely to be amused. Only the automobiles are seriously taken.

Following is a summary of the exhibits:

#### Acme Mfg. Co., Reading, Pa.

Many features peculiar to the equipment of Stormer bicycles are now found in the Pennants. The firm has recently decided to enlarge its line by the addition of a chainless model which will be fitted with the Sager gear.

Model.	Style.	Retail Price.	Wt. lbs.
Pennant, men	Chain	\$35	26
Pennant, women	Chain	35	26½
Stormer, men	Chain	40	24
Stormer, women	Chain	40	25½
Mars, 27	Chain	25	26
Mars, 28	Chain	25	27
1 and 2	Chain	20	..
3 and 4	Chain	25	..
Chainless, men	Sager gear	..	26
Chainless, women	Sager gear	..	27½

#### American Bicycle Chain Cleaner Co., New York.

This firm exhibits a device for cleaning the chain of a bicycle. The chain is first passed through kerosene, then through a hot water bath, and eventually through tallow.

#### Alpha Lamp Co., New York City.

The characteristic features of the Alpha acetylene gas lamp are: it has no tube for alimentation, no taps, no valves, is inodorous, and does not require cleaning. The contact between the water and the calcium carbide is produced by unscrewing a metallic cork. The drip is automatically regulated. The reflector has no lens, a feature which is common

to the gas lamps used in France. It is made in one pattern for cycle use and is handled by Edmond A. Dreyfus, 123 Liberty street.

Model.	Style.	Retail Price.	Wt. oz.
Cycle lamp	Gas	\$3.75	16
Carriage lamp, per pair	Gas	20.00	..
House lamp	Gas	4.00 up	..

#### Badger Brass Mfg. Co., Kenosha, Wis.

The familiar general lines of the Solar acetylene gas lamp are maintained in the improved patterns. It is much lighter in weight and slightly smaller, has an improved bracket, an instantaneously removable tip holder, a straight wick tube and new valve, which permits the lamp to be instantly lighted, besides many minor improvements, all of which will be greatly appreciated. The Badger Brass people have been making gas lamps exclusively for two years, and may with propriety lay claim to such skill in gas lamp construction, as so long an apprenticeship and experience implies.

Model.	Style.	Retail Price.	Wt. lbs.
Solar cycle lamp	Acetylene	\$3.50	..
Solar coach lamp	Acetylene	15.00 pair.	..
Solar dash'b'd lamp	Acetylene	9.00 pair.	..

#### Barkeley & Kent, New York City.

The business of this firm is largely that of a saddle exchange. It exhibits also Smith's two-roller seat post, sprocket-rims and lubricants.

#### Beckley-Ralston Co., Chicago.

This concern shows Gordon saddles. They are all padded but the wood base patterns. As makers' agents, the firm handles wrenches, hangers and hubs of the Park City Mfg. Co. and D. & J. hangers. They job the Waterbury Mfg. Co.'s pumps, the Manhattan Brass Co.'s lamps, the Badger Brass Mfg. Co.'s lamps, and the goods of the Schumacher Acetylene Lamp Co., the Pony Headlight, a gas lamp weighing, with bracket, 8 ounces; the G. L. Thompson fittings, the Hotelling brazing compounds, the Velox pedal, Crown chains and Singer hubs.

Model.	Style.	Retail Price.	Wt. oz.
Gordon extra wide	Padded	\$3.00	17
Gordon regular	Padded	2.50	15
Gordon	Wood base	2.50	15
Gordon Expert	Padded	1.50	15
Gordon Alpine	Padded	1.20	14
Gordon 14	Padded	1.00	13
Gordon Favorite	Rigid padded	.80	16

#### W. E. Blaisdell, Brooklyn.

The latest and by no means least desirable addition to the list of free pedal devices is shown. It is known as the Safety brake and coaster and possesses the merit of being applicable to any machine. The brake holder is clamped to the lower rear forks and the brake itself clamped to a rod connected with the operating device is made part of the sprocket. Inside of the sprocket rim is a second rim, on the inside of which are a series of notches in which, as the thrust is applied, a dog engages. Back-peddalling slightly releases the dog and allows the wheel to run freely; heavier backward pressure operates on a hinge in the brake rod and applies the brake to the rear wheel.

#### Black Mfg. Co., Erie, Pa.

The quality of the goods made by this house is never challenged. On this account, however, the firm does not refuse to refine its manufacture from year to

year, a fact which is plainly evident from observation of its models. Whatever success may be in store for those who manufacture 30-inch wheels, it is pretty generally conceded that the Black company will, from its pioneer aid in connection with the movement, reap much of the anticipated advantages. All models are fitted with the recently patented internal expanders for fastening bar and seat post, both of which devices are to the credit of Mr. L. B. Saylor, vice-president and general manager of this concern.

Model.	Style.	Retail Price.	Wt. lbs.
Men, 40	Chain	\$40	23
Women, 41	Chain	40	25
Men, 42	Chain	50	22½
Women, 43	Chain	50	24½
Men, 44	30-in. wheels	50	23½
Racer	Chain	75	19½
Men, 460	30-in. wheels	75	22
Tandem	..	100	37
Triplet	..	100	58

#### Hermann Boker & Co., New York City.

With a varied and extensive line this house makes an interesting display. In cycles its attention is confined to the Imperial. The line of lamps is, perhaps, the most comprehensive in the show, embracing the products of four makers. To the Solar reference is made elsewhere. Other acetylene lamps are the Crescent and Breckenridge, the former listed at the popular price of \$2.50 and weighing 12 ounces. The Breckenridge is also made for oil. The Fonto electric completes the list. The Baldwin brake is given space, as is a suitable show of M. & W. tires.

Model.	Style.	Retail Price.	Wt. lbs.
Imperial 100, men 30-in.	Chain	\$55	25
Imperial 90 men	Chain	50	24
Imperial 91 women	Chain	50	24
Imperial 80, men	Chain	35	24
Imperial 81, women	Chain	35	24

Model.	Style.	Retail Price.	Wt. oz.
Breckenridge lamp	Acetylene	\$3.50	14
Light Weight lamp	Oil	1.00	14

#### E. A. Brecher & Co., New York City.

Two frame patterns are shown by this firm. One, the Perfection, has drop forged lugs and seamless tubing, with Thor hangers, rear fork ends and expanders. The other, the New Century, has seamless tubing, a Fauber hanger and Thor expanders. Peter Forg's forged sprockets and a general line of fittings are also displayed.

#### Bridgeport Brass Co., Bridgeport, Conn.

This firm exhibits Search Light oil and gas lamps, aluminum pumps, a new pump with patented expander or plunger, and oiler for home use. The new Search Light gas lamp will retail for \$5. In it the water is placed below the carbide and fed up through a wick. The flow of the water and consequent height of flame are under easy control. The water supply is automatic. The oil Search Light will retail at \$3.50.

#### Bridgeport Gun Implement Co., Bridgeport.

The exhibit consists of a sample of each article made, embracing the following: Ray saddle, aluminum base, the feature of which is an opening on each side, bridged over with leather, on which the pelvic bones rest; weight, 18 ounces; retail price, \$3.50; Star pedals, price \$3.50; Bridgeport pedals, price \$3; Echo call, Universal whistle, B. G. I. screwdrivers, Brooklyn, Simplicity and Biped stands, golf outfits.

#### Brown Lipe Gear Co., Rochester.

The changeable gear made by this firm is exhibited upon a Cleveland bicycle. A display is also made of the handy tool which the company makes for the repair of tires.

#### Bullis Ball Gear Co., Rochester.

The Bullis ball gear escapes the requirements for great accuracy of gear adjustment and frame alignment of the bevel gear by having the axes of all roll-

# STERLING CYCLE WORKS, KENOSHA, WIS.

ers at an angle somewhere near 45 degrees with the pinion shaft. The rollers are in the form of steel balls mounted to revolve on pins. The balls of one pinion engage the balls of the other pinion, and both balls in engagement accommodate themselves by rotation on their journal pins to the requirements of the gear motion. The contact is always at a single point on both balls, but the rotation causes this point to travel over both balls in an S-shaped line, thereby distributing the wear which, on account of the purely rolling contact, is very insignificant. Side thrust is eliminated very largely by shaping each pinion with scalloped edges and mounting the balls in the scallops; thus the ball rollers of one pinion reach deeply into the engaging pinion, and the driving force is exerted in an approximately vertical line without any tendency to push the two pinions apart at point of engagement. The intermeshing is continuous without back lash. This gear will be handled in the west and south by the Excelsior Supply Co., of Chicago.

**Frank E. Bundy Lamp Co., Elmira, N. Y.**

In the Bundy lamp, which has been perfected after two years of experimentation and trial, all the objections which have been lodged against gas lamps have been overcome, and its makers declare it perfect. In such matters as efficiency in use, ease of charging, certainty of operation, control of water supply, and even generation of pure dry gas, the lamp fulfills all requirements. All its parts are interchangeable. It is adapted for cycle, carriage or house use. A neat physician's gas lamp is exhibited and should find a ready sale at the hands of dealers. It is intended to aid in the examination of the throat, eye or ear, or in any of the surgical operations where artificial light is needed.

Model.	Style.	Retail Price.	Wt., oz.
Cycle lamp	Gas	\$3.50	20
Physician's lamp	Gas	5.00	..
Fireman's lamp	Gas	3.50 up	..

**Claus Handle Bar Mfg. Co., Milwaukee.**

The Claus bars have become too well known to need detailed description. Attention is due, however, to an expansion stem, one of the latest of the company's devices for the insurance of convenience and comfort. It is claimed that in many of the expanding devices commonly used the point of contact of the expander with the lug or tubing is so small as to be inefficient. To overcome this the Claus company cuts its post in two at an angle of about 90 degrees, runs a rod down through and connects with the bottom, and, by means of a nut at the top, draws it upward. The result is contact between the post and the tubing extending over the entire length of the post. No wrench is required on any of the Claus bars, yet they are almost instantly adjustable to any desired position.

**G. W. Cole & Co., New York City.**

"3-in-one" cycle oil long ago became a fixture in the cycle trade. Energetic handling and adaptability to the trade's requirements have made it a fixture. Puncture healing fluids, chain lubricant, toe clips, luggage carriers, nipple wrenches and other small articles are also exhibited.

**Crawford Mfg. Co., Hagerstown, Md.**

Each year this firm aims to add to its line in order that customers may not complain on the score of incompleteness. Crawford machines are built for service. They lack nothing which can aid the dealer in effecting sales.

**Cushman & Denison, New York City.**

Oilers, standard articles which have been before the trade for many years, are the sole feature with these exhibitors, who have applied themselves to doing one thing and doing it well. There are four patterns, the Perfect, Star, Leader, and Gem, ranging in price from 25 cents for the first to 5 cents for the last named.

**Davis Sewing Machine Co., Dayton, O.**

The Dayton is shown in conjunction with the Tinkham exhibit. The Hussey hub, made a feature of the latest models, is the point of interest. The advantages claimed are lightness, increased strength, the impossibility in the absence of flanges of the spokes pulling out, and general cleanliness in and about the hubs and hangers.

**Diamond Rubber Co., Akron, O.**

The woven fabric used by this firm in the construction of its single tube tires for bicycles is also employed in the construction of its vehicle tires, which are made in cross diameters from 5 inches down to 1¼ inches, and in weights from 35 pounds apiece down to 2 pounds apiece for use on sulkies. The vehicle tire fabric is from three to twelve ply.

Model.	Style.	Retail Price.	Wt., lbs.
Clipper	Single tube	\$6	4
Antelope	Single tube	6	4
Crown Prince	Single tube	6	4
Diamond A	Single tube	8	4
Diamond B	Single tube	7	4
Vehicle tire		7	35

**William Diebel, Philadelphia.**

Swinging pedals with a single bearing are the specialty of this exhibitor, who also shows a bell operated by contact with the tire and the Quaker City toe clip.

**Jos. Dixon Crucible Co., Jersey City, N. J.**

A graphite crucible employed in brazing by immersion attracts unusual interest. The firm reports that there is a constantly increasing demand for special information which will enable bicycle manufacturers to proceed intelligently in the

work of dip brazing. Special crucibles, always made of graphite, are occasionally demanded, some orders having recently been received for circular pots such as are in common use in brass foundries.

**Empire Rubber Co., New York City.**

Referee, Eureka and Hercules tires are shown by this firm. A cure for porous tires is also exhibited.

Model.	Style.	Retail Price.
Referee	Single tube	\$8.00
Eureka	Single tube	6.00
Hercules	Single tube	4.00

**Eureka Trading Co., New York City.**

Three models for jobbers, on which no retail prices are given, comprise this firm's line. All are of standard equipment, with no departure from accepted lines.

Model	Style.	Wt., lbs.
Day, men	Chain	22
Day, women	Chain	25
Cosmopolitan, men	Chain	22
Cosmopolitan, women	Chain	25
Eureka, men	Chain	22
Eureka, women	Chain	25

**W. H. Fauber, Chicago.**

The Fauber exhibit is practically a duplicate of the Chicago display. One point causes comment, viz., a comparative statement of the volume of business transacted in Fauber hangers during the past five years. A portion of a triplet frame, prominently displayed and decorated with small incandescent lamps, shows the applicability of the hanger to multicycle construction. An exaggerated hanger is used for purposes of demonstration of its mechanical principles.

**A. Featherstone & Co.**

All Featherstone models are finished with extreme neatness, particularly at the head and seat post cluster. Their crank axle construction is extremely simple. A racer is exhibited for the first time. The policy of the house is to meet the demand of agents for a complete line of machines at popular prices and which can be retailed at a good margin of profit.

Model.	Style.	Retail Price.	Wt., lbs.
Model A	30-in. wheels	\$50	26½
Racer	Chain	50	22
Model C, men	Chain	40	25

# Plain Talks on Andrae Cycles

VI—Track Racer, Model 42, \$60.

The Andrae Track Racer costs \$60.

To professionals, amateurs, anybody.

The Andrae is ridden by more professionals than any other wheel they must pay for.

It pays to ride an Andrae even though you must pay for it and ride without a salary.

First prizes usually amount to more than salaries.

Riders of other wheels get salaries, riders of the Andrae get first prizes.

The racing men of your town are not the only men to whom you can sell the Andrae racer.

There are many others who want the fleetest bicycle made.

Write for trade prices on the Andrae line of 15 models.

Send us your name and address for our monthly paper, "The Andrae Agent."

Chainless, women	Bevel gear	75	27

**Green & Haskell, New York City.**

This firm is the selling agent for the gas lamps made by the Electro Lamp Company. The lamp possesses the advantage of being small and so constructed as to generate gas from loose calcium carbide or prepared charges of it.

Model.	Style.	Retail Price.	Wt. oz.
Electro lamp	Gas	\$3.50	14

**Hartford Rubber Works Co.**

Tires for motor vehicles are strikingly in evidence at this booth. Their construction is similar to the well known single tube construction peculiar to this firm. They are made in 56-inch size and vary in cross diameters from 1 3/4 inches to 5 inches. The other five patterns shown are as follows:

Model.	Style.	Retail Price.	Wt. lbs.
Pattern 70	Road	\$ 8	4
Pattern 80	Light Road	10	4
Pattern 75	Racing	10	2
Pattern 77	Regular Road	10	4
Pattern 77 H	Tandem	10	4 1/2
Juvenile Patterns.			

**Hollenbeck Saddle Co., Syracuse.**

For a combination of reasonable price, quality and comfort, the Hollenbeck rawhide saddle, now in its third season, is commendable. The strength of the material makes it possible to produce a durable article without the usual base, hence lightness and flexibility are secured. The Hollenbeck weighs but twelve ounces and retails at \$2.

**Heinz & Munschauer, Buffalo.**

Eight models of Heinz bicycles afford liberal choice in style and price, two of the models being fitted with 30-inch wheels. The H. & M. one-piece crank hanger and the Charles O. Barnes coaster and brake are the exhibits outside of the bicycles. The coaster is obtained by a

slight back pressure on the pedals, which releases a sprocket clutch and allows the wheels to run independently. Back pedalling sets the brake, which has no contact with the tire, its mechanism being clustered at the crank hanger; forward pedaling releases it.

Model.	Style.	Retail Price.	Wt. lbs.

**Howard & Pike, New York City.**

This concern has an exhibit of interest to cyclists who ride the year round, consisting of paper waistcoats designed for protective purposes in winter.

**Thomas B. Inness, New York City.**

The bicycle locking and checking devices formerly manufactured by the Cycle Checking Lock Company are on exhibition in this booth.

**R. H. Ingersoll & Bro., New York City.**

This firm is exhibiting regularly constructed bicycles, as well as a 30-inch model, a full line of frame sets and electrically welded fittings made by the Geo. L. Thompson Mfg. Co. and the Standard Tool Co., Lobdell rims, Excelsior spokes, Lerch saddles, Yankee lamps, pedals, hubs and pumps. The Lerch saddles are shown in three models, one in the Brown pattern and the other two anatomical.

Ingersoll	30-in. wheels	40	25

**International Cycle Fittings Co., New York.**

This house shows frame sets, built up bicycles and frames. All frame connections are made from drop forgings. The bicycles are fitted with Sunbeam spokes. The International and Criterion hubs are the company's own line and it jobs Thames and Baldwin chains, National pedals and numerous sundries.

**Iven-Brandenburg Co., Chicago.**

Thor hangers, hubs, frame connections, etc., are exhibited in conjunction with Lefever chains, Morse Keefer Co.'s spokes with nipples, Tucker rims and wood guards, and Chicago Drop Forge Co.'s goods. The Iven-Brandenburg Co. is acting as selling agent in the United States for Sager chainless gears and saddles.

**Iver Johnson's Arms & Cycle Works, Fitchburg.**

At a time when the majority of bicycle makers are busy exploiting the serviceability of sheet steel stampings, this firm finds particular satisfaction in stating that in its models drop forgings are used at all of the connections. The distinguishing feature of the higher priced models is the new design in front fork crown, which is arched and open, giving in structural effect and appearance the advantages which are contained in both implied forms of crown construction.

**Jamieson Mfg. Co., Rochester.**

The Spinroller gear exhibited by this concern consists of two sets of intermeshing rotary roller teeth, each tooth curving towards its axis. The rollers are supported at their outer ends by a finger-like plate, which supports them rigidly and prevents them from springing the slightest degree when pressure is placed

upon them. The studs on which the rollers are mounted are accurately spaced, and the rollers are ground to a thousandth of an inch. The Spinroller gear is so constructed that when one roller rolls against the other, the working surface is in point contact, and for this reason will stand a considerable degree of deflection. A study of the mechanism shows that the line of pressure is always vertical, upwards at one end of the shaft and downwards at the other. The result is that the Spinroller gear machine starts off with wonderful life the moment pressure of the foot is applied to the pedal.

**L. C. Jandorf & Co., New York City.**

This firm will soon occupy the whole of a large building, situated at 5 West Fourteenth street, as a retail establishment and for repairing and carrying on a general jobbing business. Its exhibits are as follows:

**Kelly Handlebar Co., Cleveland, O.**

This company will soon use a new clamping device which it is confidently predicted will outlaw many of the devices now in use and shame them in the mat-

ter of simplicity of construction. The No. 3 handle bar pattern has a range of 25 positions. No. 2 for women, No. 3 which is special, and No. 4, which is the racing pattern, round out the line. The finish of the goods is ample evidence of the care taken in the manufacture.

**Kells Mfg. Co., Cleveland, O.**

The fixed aim of this concern is to give a full seat without inconveniencing the rider. The aluminum base of the anatomical pattern is perforated. All the anatomical patterns are fitted with coil springs.

**Kirk Mfg. Co., Toledo.**

The retention of the Yale flush yoke in the special models made by The Kirk Mfg. Co. is ample evidence of the strength of its tubular construction, which has now been in active service for two years. The eccentric chain adjuster on the special models is a feature highly valued by the makers. The two-piece crank used in these models makes use of the principle of locking the free crank by means of the sprocket wheel. Perfect registration between the holes in the sprocket ring and those in the spider is secured by means of an original and ingenious device.

**Lever Hillclimber Co., New York City.**

This firm exhibits a device by which an increase in crank leverage is obtained by artificial lengthening of the crank without increasing the diameter of the stroke of the pedal.

**John S. Leng's Son & Co., New York City.**

This concern handles about 3,000 different articles suited for the cycle trade. Its principal lines are as follows: Weldless steel tubing made in England, Morgan & Wright's tires, Indianapolis Chain & Stamping Company's goods, Plymouth wood rims, Crosby & Mayer's sheet steel stampings, Fiber Buckskin grips, Brennan adjustable handle bars, Snell bicy-

cles, Springfield Drop Forging company's goods, Independent Supply company's expanders, Forsyth Mfg. company's pedals, brakes and metal chain guards, and Butler & Ward's saddles.

**Liberty Cycle Co., Bridgeport, Conn.**

This firm probably manufactures more models than any concern engaged in cycle manufacture, and justifies this policy by declaring that few riders sit on their machines alike. Consequently Liberty models are raked at the seat mast and constructed with varying lengths of top rails. Notwithstanding this, the variation in wheel base length is very slight.

**H. A. Lozier & Co., Cleveland.**

The dress and chain guard fitted to the women's patterns of Cleveland bicycles is one of a number of minor improvements which are noticeable in the product of the Lozier factory. The firm is making a specialty of a finely finished and well constructed light model for women and confidently anticipates that before the end of the forthcoming season that it will have demonstrated the wisdom of building light bicycles for the fair sex. The Lozier people do not attempt to defend the practice of putting weight in women's machines, particularly when they are sold at a stiff price. The firm has decided to build chainless bicycles fitted with the Sager gear.

**Manhattan Bicycle & Sporting Goods Co., New York.**

This firm is exhibiting as agents for the Columbia, Liberty, Orient and Defender bicycles. A bicycle canopy with roller shade, and a self-instructing cycle riding device with upright attachments, are also shown.

**Manhattan Shoe Co., New York City.**

This firm jobs the Rice & Hutchins bicycle shoes, which are designed to give ease to the feet and ankles while pedaling, extra fullness being allowed over the toes to relieve the pressure.

**Manhattan Brass Co., New York City.**

Acetylene lamps in two styles are the result of this firm's two years' experience in the manufacture of lamps of that description. They embrace only those features which have been thoroughly tested and found valuable. Extreme simplicity of handling and detachment of the parts

characterize the line, the weights, sizes and prices of which will satisfy all classes of purchasers. In oil lamps the company show the Queen, which opens like a watch case, and the Frontlight. Ideal hand and foot pumps are also shown.

Model.	Style.	Retail Price.	Wt., oz.
Brilliant	.....Gas	\$3.50	18
Gem	.....Gas	2.00	11
Queen	.....Oil	1.50	11
Frontlight	.....Oil	2.50	13

**Manhattan Storage Co., New York City.**

The Manhattan chainless, fitted with the Gentry gear, has lately been added to his company's line and is therefore prominently displayed. The retail price is \$55. Other machines are the Manhattan Three Crown and the Manhattan. In the matter of sundries and equipment of all sorts the supplies are almost inexhaustible. This embraces nearly all the standard articles. The catalogue, intended for trade distribution only, is worthy of a place in every agent's office.

**Manson Cycle Co., Chicago.**

Manson bicycles without their characteristic feature of three crown frame construction are now being manufactured, but at lower prices than the models which have this familiar construction. The frame connections are made both from forgings and sheet metal.

Earl, girls	.....24-in. wheels.

**W. B. Miller's Sons, Brooklyn.**

This firm exhibits Excelsior lubricants for bicycle chains and also for bearings and for chainless bicycle gears.

**J. G. Moomy, Erie, Pa.**

The Moomy chainless bicycle of bevel gear type is exhibited in conjunction with the X-Ray plugger for tire repairs, Leak Nit cement, Ives valves, and Little Marvel cyclometers. In the chainless machine the crank gear and front pinion of the driving rod are both carried by double bearings mounted in the same hanger. It is claimed for this construction that it is impossible to spring the gears out of proper relation to each other. The rear gears are both supported by double ball bearings enclosed in a rigid bracket. The hub of the wheel is internally screw threaded at one end and is screwed into a projection extending from the rear gear. A flange nut is screwed on the outward surface of the hub, the thread having the opposite pitch to that on the gear, the effect of which is to lock the gear with the rear wheel. The axle extends through the rear gear and is screwed into the bracket which carries the driving gears. To remove the rear wheel the axle is unscrewed and taken out, which loosens the flange nut from the hub, and the wheel can be unscrewed

from the rear driving gear. The object of placing the gears in double bearings is to insure their positive alignment.

**Monarch Cycle Mfg. Co., Chicago.**

Considerable attention has been paid to the improvement of the appearance of Monarch bicycles at the seat post cluster and rear forks. The handle bar expander is of new construction. A double diamond tandem is made so as to be readily convertible from double to single steering. The company has decided to manufacture chainless models of the bevel gear type.

**National Cement & Rubber Co., Toledo.**

This firm exhibits enameling ovens, brazing torches and cements. A double wall, dust-proof, four-frame enameling oven is the only oven shown, though the company makes them in all sizes. The No. 2 brazing forge is new. It has three burners working on a swivel. The brazer burner has five chambers and gives a rotary scope around the burner, allowing no escape. Model 1/2 retails at \$14, Model 1 at \$18, and Model 2 at \$22.50. The vulcanizers retail at \$5.40 each, both for the hot air and steam. The No. 2 torch is a brazer burner on the principle of the No. 2 forge and retails at \$3. Jifoid, a new cement, makes a plug of itself, and is put up in a tube with a puncture point ready for use as it stands. Enamels and graphites are also shown. The company will devote much attention this season to the export trade.

**National India Rubber Co., New York City.**

This company shows tires constructed for various uses in one general style—the Kangaroo. The goods are made in sizes and weights to suit all requirements. The retail price of the tires is \$10.

**National Slot Machine Co., New York City.**

A penny dropped in the slot of a machine exhibited by this firm releases a three-foot hand lever, which requires but a few strokes to inflate the tire.

**National Sewing Machine Co., Belvidere, Ill.**

One of the very few machines with 30-inch wheels for women is a noticeable feature of the firm's line; a 20-inch diamond frame machine for women is another. In the matter of mechanical features the eccentric hanger, with 4-inch drop, permits regulation to the extent of three-quarters of an inch. In other respects the line, well known in the trade by reason of mechanical excellence, is familiar to every painstaking agent.

**New York Sporting Goods Co., New York City.**

The Nassau Special and Patee Crest machines are handled by this firm, together with a line of sundries and Dietz lamps. The prominent feature of the exhibit is the Patee Crest, whose combination of modern construction and popular price seems likely to secure for it a full share of eastern business.

**New England Cycle Supply Co., Keene, N. H.**

The stand of this firm is a veritable paradise for the intelligent repairman,

whose every need seems to be anticipated. Wheel assembling chucks, semi-automatic rim drills, repair jacks, truing stands, enameling stands, tube straighteners, rim spacers, emery grinders and axle straighteners are among the old products of the company, but to these have recently been added a tree, for sundries, at \$2.50; a hand-operated repair jack, adjustable to almost any position, at \$5; a display stand, at \$5, and a new truing stand at \$4.

**Niles Tool Co., New York City.**

The Woods patent elastic polishing wheel, shown by this firm, is made up of two disks or flanges, one keyed fast to the shaft and the other free to slide on a feather. These flanges are connected at their edges by a flat rubber belt held in place by clamping rings. Over this belt is placed an endless leather belt for polishing. When the machine is in rapid motion the centrifugal force acting on the rubber tends to expand and increase its diameter, the disk that slides on the shaft being by this centrifugal action drawn towards its mate. As is well known, the high points of a hard wheel do all the work, and hence there is uneven effect on the material to be polished. The Woods wheel being in effect an elastic polishing belt running automatically true, offers just the amount of resistance required. By means of a special fixture bicycle hubs can be applied to the machine and polished ready for plating at a rate of fifty or more an hour. Pedal plates can be polished at the rate of 200 an hour.

**Oakman Motor Vehicle Co., Greenfield, Mass.**

The Hertel motor carriage and package delivery wagon recently brought out by this concern are apparently very light and simply constructed vehicles. The carriage is easily controlled. The company is prepared to deliver vehicles at once and turn out any quantity that may be required. The carriage for two people weighs about 475 pounds.

**M. G. Oppenheim, New York City.**

Handle bars made entirely by a cold process by the Morgan Machine Works are the leading feature at this stand. Many of them are provided with an internal locking device. The Faultless roller brake of the Sundry Company of Baltimore is shown, as are toe clips, pedals, grips, clamps and other sundries made by the Sidway Mfg. Co., of Chicago.

**Overman Wheel Co., Chicopee, Mass.**

It is openly said by the makers of the Victor that the last vestige of old stock was cleaned out of the factory last fall, and as a result they are enabled to claim that the improved models are new in the enlarged trade sense of that word. Many of the parts of the women's model are interchangeable with the model for men.

Chainless	Spinroller	75	25 1/2

**Pope Mfg. Co., (Bicycles).**

The Columbia bevel gear machines have been vastly improved both in external appearance and structural form. The main frame tubes are of 1 1/4 inch diameter; internal expanders are found at head and seat post; the gear covers are smaller; rear forks and hubs narrower. The forward gear mechanism which last year was assembled directly into the crank bracket itself is now placed in an independent bushing or sleeve, which is inserted in the bracket and clamped in position. The gear adjustments have been made entirely independent of the bearing adjustments, both front and rear. All of the gears bear directly in the lines of thrust, the ball races of the several

bearings supporting the gears forming a part of the gears themselves. The crank shaft bearing on the gear side has been carried to the periphery of the main driving or master gear. By these changes in the bearings all danger of springing the gears out of perfect mesh is avoided. The early chainless machines made by this firm will this year sell at \$65.

**Plew Saddle Co., Chicago.**

It is due to the excellence of this company's saddle and methods of pushing it that the trade recognizes as a household word the maxim that "its nose is soft." The firm's endeavor from the outset—and it has been successful in a marked degree—has been to satisfy all the requirements of a hygienic seat combined with that freedom of action which conduces to speed. Following up its early successes, the company has introduced the Plew hub and offers it at a price

which, it claims, cannot be duplicated. In addition to its own manufactures, the Pley company handles Peru rims and guards, Colmer hubs, Eli and Elyria pedals, Duthie and Indiana chains, Brown saddle, India tires and miscellaneous small articles.

**Pope Mfg. Co., (Motor Vehicles).**

A peculiarity in the construction of the electrically propelled phaeton is that its frame is made of steel tubing. The frames of all the Pope vehicles are rigidly braced and extremely strong, although as light as possible. It is the intention of the company to supply gasoline-driven vehicles upon demand. In the phaeton power is transmitted by double reduction; the other vehicles are driven direct.

Model.	Style.	Retail Price.	Wt., lbs.
Doctor's phaeton	Electric	\$2,500	2,000
Dos-a-dos	Electric	2,750	2,600
Surrey	Electric	3,000	3,000
Package carrier	Gasoline	750	850
Delivery wagon	Electric	2,250	3,500

**Ramsay Swinging Pedal Co., Philadelphia.**

Five models of the Ramsay swinging pedal, and toe clips suited for use with them, are shown by this house.

Model.	Style.	Retail Price.
A		\$3.50
B	Rat trap	3.50
C		3.50
D	Rat trap	3.50
E	Rat trap	3.50

**C. M. Rice Co., New York City.**

The goods exhibited by this firm are as follows: Armstrong Brothers' Tool Company's products, New Brunswick tires, Fauber complete bottom brackets, Sunbeam spokes, Thor hubs and bottom brackets, Cleveland glue, the original Keene rims, Rosenblatt saddles, complete frame sets and complete wheels.

**Riker Electric Motor Co., Brooklyn.**

Riker automobiles are constructed for pleasure service, delivery work, for short or long distances, and for city or suburban use. The firm is prepared to supply any style of vehicle desired.

Model.	Style.	Retail Price.	Wt., lbs.
Stanhope phaeton	Electric	\$2,000	2,000
Dos-a-dos	Electric	2,200	2,500
Surrey	Electric	2,300	2,700
Tricycle	Electric	1,000	800
Delivery wagon	Electric	2,250	3,500

**W. R. Rollins Mfg. Co., Chicago.**

This firm is exhibiting a three-crown jobbing machine made with 28 or 30-inch wheels; also a special export machine fitted with metal guards, rims and brakes.

**Rose Mfg. Co., Philadelphia.**

The Neverout lamp for cycles and carriages is exhibited. It burns kerosene, has a patent insulated reservoir and a glass-covered German silver reflector. The experience of the makers leads them to claim that the lamp is the nearest approach to a perfect article known to the trade. The retail price is \$2.70.

**Safety Oiler Co., New York City.**

Bicycle oilers in plain form and in combination with match safes, as well as oilers for machinery, are exhibited by this firm.

**Sager Gear Co., Rochester.**

The Sager roller gear is exhibited in Iver Johnson, Cleveland, Ariel, Orient, Wolff-American, Hampshire and Defender bicycles. Formerly the pins in the Sager gear were soft and the rollers were hardened; now the pins and roller blanks are both hardened. Formerly the gears were open; now they are enclosed in aluminum casings. Riders can get gears

of 82 or 92. Taylor, the racing man, had gears of 108 and 114. Eighteen patterns of Sager saddles are also exhibited, the leader among which is the Flexible, so-called because its base is not made of wood or metal, but of sole leather, and built up with felt.

Model.	Style.	Retail Price.	Wt., oz.
Flexible saddle, men		\$4.00	..
Flexible saddle, women		4.00	..
Sager, men, 1	Semi-flexible	3.50	..
Sager, men, 12			..
..... Loop spring, hair padded		3 00	..
Sager, women, 15			..
..... Coil spring, hair padded		3.50	..
Sager racing (with clip)	Hard top	2.50	15

**N. Schroder, New York City.**

This concern exhibits various models of the Rusch saddles. The saddle for women is designed with care. Its nose is short; it is wide enough for comfort. The racing man's pattern is resilient without being soft.

Model.	Style.	Retail Price.
No. 7	Lateral coil	\$1.75
No. 8	Flat springs, padded	2.50
No. 9, women	Flat springs	2.50
No. 10, racing	Wire springs, hard	1.75
No. 11, road	Wire springs, padded	2.50

**Thomas L. Smith & Co., New York City.**

This company manufactures a jobbing line and endeavors to emulate the work of the better class of makers.

Model.	Style.	Retail Price.	Wt., lbs.
Men, A 1	Chain	\$65	23
Men, A 2	Chain	65	23
Women, B 1	Chain	50	25
Women, B 2	Chain	50	25
Princeton, men	Chain	25	24
Princeton, women	Chain	25	25

**H. P. Snyder & Co., Little Falls, N. Y.**

This concern is exhibiting bicycles for the jobbing trade. Such features as are the first to attract the attention of buyers are enumerated in the following table:

Model	Style.	Wt., lbs.
Men, A	Chain	24
Men, B	30-in. wheels	24
Women, B	Chain	24
Juvenile, boys	24 or 26-in. wheels	21
Juvenile, girls	24 or 26-in. wheels	21
Men, E	Chain	24
Men, E	30-in. wheels	24
Women, F	Chain	24
Chainless	Sager gear	25

**A. G. Spalding & Bros.**

The Spalding chain bicycle models show new designs in sprockets. The pedals are faced with lead, instead of rubber, in order to resist wear. There is half an inch less drop in the hanger than in former patterns. A racing tandem, the first made by this firm, is also exhibited. The construction of the juvenile models appeals to those who appreciate high class construction. Christy saddles are also on exhibition.

Model.	Style.	Retail Price.	Wt., lbs.
Model 2122, men	Bevel Gear	\$75	..
Model 2022, women	Bevel Gear	75	..
Racer	Chain	60	..

Christy saddle, women	9 in. wide	..	..
Christy saddle, women	7 1/2 in. wide	..	..

**Stockton Mfg. Co., Newark, N. J.**

The Gem pedal exhibited by this concern has a cone with notched flange, the notches intersecting with a heavy V steel washer, which fits in the groove of the pin and thus prevents the cone from turning in either direction. The pedal is made in rat-trap and combination styles for men and women. The Stahl detach-

able chain sells at 35 cents a foot, which is a plain indication of its grade. A break in it can be repaired in a minute by the use of a penknife. The Gem and Leader hubs gave such satisfaction last season that the firm has not found it necessary to make any alterations in their design.

**E. C. Stearns & Co., Syracuse.**

Here is another concern which is pushing cushion frame bicycle construction to the front. Morrow brakes are fitted at an extra charge of \$10 and New Departure brakes at a charge of \$1. The graceful frame lines which long have characterized Stearns models are still in evidence.

Model.	Style.	Retail Price.	Wt., lbs.
Men, E	Chain	\$50	24
Women, F	Chain	50	25
Chainless, men	Bevel gear	75	26 1/2
Chainless, women	Bevel gear	75	27 1/2

Cushion, women	Chain	65	23 1/2
Special, men	Chain	60	21 1/2
Special, men	30-in. wheels	60	22 1/2
Special, women	30-in. wheels	65	24
Racer	Chain	60	20
Tandem	Combination	75	45
Tandem	Double diamond	75	43

**Straus Tire Co., New York City.**

A close woven fabric is used in the construction of the tires made by this firm. A display is also made of pedal rubbers, which can be snapped on the foot, and of repair plugs which are curved on their base in order to conform to the inner surface of the tire when drawn into position.

Model.	Style.	Retail Price.
Straus	Single tube	\$8.00
American	Single tube	6.00
Goodyear	Single tube	4.50
S. & R.	Detachable	10.00

**E. E. Stone & Co., Spencer, Mass.**

The Dunbar foot and plunger brakes and the Dunbar folding bicycle crate are exhibited by this firm. The crate resembles the ordinary pattern, but has its parts strongly hinged and riveted. In placing a machine in the Dunbar crate it is only necessary to remove the pedals.

**The Tinkham Co., New York City.**

In addition to the Stearns and Dayton, for which it holds the New York agency, the Tinkham company makes a machine of its own for men and women at \$25. The principal feature on the stand, however, is a motor tricycle, with drop frame, the whole of the mechanism of which is controlled by two levers alongside the saddle post. The Tinkham company makes a specialty of carriers and invalid chairs.

**Translucent Window Sign Co., New York.**

This firm exhibits translucent window signs applied to the inside of glass in store doors or windows.

**Twentieth Century Mfg. Co., New York City.**

Three hundred and fifty lamps, equally divided between gas and oil, are being distributed by the Twentieth Century Mfg. Co. free of charge at the show. Every catalogue distributed bears a number and each evening a drawing is held. The winning numbers are posted conspicuously on a card in front of the stand. In the equipment of the space Mr. Castle has embodied one or two ideas new to American shows, one of the results of his observations abroad.

Model.	Style.	Retail Price.	Wt., oz.
Twentieth Century	Oil	\$2.50	
Twentieth Century	Gas	3.50	16

**United States Battery Co., New York City.**

This is one of the few concerns which has brought a wireless lamp, devoid of complications and of reasonable weight, within the range of commercial possibility. It burns from ten to twelve hours,

weighs twenty ounces, and costs about 1½ cents per hour in operation. Originally the batteries cost 50 cents per pair; when exhausted they are exchanged for new ones for 15 cents. The retail price of the complete outfit is \$3.75.

United Specialty Co., New York City.

Automatic tire inflators are exhibited by this firm. In the device is a drum containing liquified carbolic acid gas, which vaporizes on being released by a penny dropped in the slot of the machine.

Veeder Mfg. Co., Hartford, Conn.

The new trip recording cyclometer made by this firm is rendered doubly interesting on account of the fact that its manufacture has led to the introduction of a new metal. The shell of the instrument is cast in two pieces and in such a perfect manner that machining is not necessary. White metals heretofore produced, while non-corrosive, have not been sufficiently tractable in the hands of workmen to render them fit for the manufacture of parts which are subjected to friction. The Veeder people, however, show that with their new metal all the gears as well as the shell of the trip recording instrument can be made of the same material, and assert that the instrument will run 125,000 miles at the rate of eight miles per minute without showing appreciable wear.

Vim Bicycle Co., Chicago.

The tire fitted to the machines made by this house is constructed to its special order and is guaranteed for a year and repaired free of charge during that period.

Model.	Style.	Retail Price.	Wt., lbs.
Men, 30	Chain	\$35	23
Women, 31	Chain	35	23
Men, C	Chain	35	23
Women, D	Chain	35	23
Men, 10	Chain	35	23
Women, 11	Chain	35	23
Men, E	30-in. wheels	35	25
Men, B	Chain	25	23
Women, B	Chain	26	23

Waltham Mfg. Co., Waltham, Mass.

Outside joints are found on all Orient models. The women's model has two straight tubes running from the head to the seat mast, making a very rigid frame. There is thoroughness of work disclosed in even the most casual inspection of Orient construction. The frame design for reception of bevel or roller gears attracts great interest.

Model.	Style.	Retail Price.	Wt., lbs.
Men	Chain	\$50	22½
Women	Chain	50	25
1.30 racer	Chain	65	20
1.30, women	Chain	65	22½
Men	Bevel or Sager gear	75	26
Women	Bevel or Sager gear	75	28
Tandem		100	42

Watson Automatic Seat Post Co., New York.

This seat post is constructed without fastenings or reinforcements and binds equally its whole length. A tap on the top of the saddle locks the post, and another tap under the point of the saddle releases it. Many bicycle makers fit the Watson post on their machines.

Western Camera Co., New York City.

As a relief from the tedium of constant inspection of mechanical features, the exhibit of scenery photographed by cyclists, which is presented by this firm, affords an unlooked-for but very welcome pleasure. The camera display is complete.

Wheeler Saddle Co., Detroit.

The cork top saddle pattern made by this firm is one of the many interesting features of the exhibit. All patterns are made longer and narrower in the nose than heretofore, and are tipped up behind. The variety of finish is an indi-

cation of the closeness with which the company studies the tastes of the public.

Model.	Style.	Retail Price.	Wt., oz.
Men's extra	Hair padded	\$3.50	15
Women's extra	Hair padded	4.00	23
Men's special	Wool felt padded	3.50	14
Men's Cork Top racer			
	Cork padded	3.50	14

Whitehead & Hoag Co., Newark, N. J.

An interesting exhibit of advertising novelties in the shape of buttons, badges and a variety of other articles is being made by this firm, which has the largest business in the world exclusively devoted to the manufacture of advertising novelties.

W. A. Whitelaw & Co., New York City.

As jobbers of fittings and sundries this firm displays the nickel steel chains made by the Power Mfg. company, the Perfection handle bar, which is square shaped without drop and covered with leather, and the Mesinger Bicycle Saddle company's goods.

Model.	Style.	Retail Price.
Model C (3)	Hygienic	\$2.50
Model J	Double base, padded	2.50
Model K	Double base, hard	2.50
Model L	Double base, padded	2.00
Model M	Double base, hard	2.00
Model O	Single base, padded	1.75
Model P	Single base, hard	1.75
Model O (new)	Metal base, felt pad'd	1.75
Model Q (new)	Metal base, felt pad'd	1.50
Model Q	Single base, padded	1.50
Model R	Single base, hard	1.50
Model S	Single base, padded	1.25
Model T	Single base, hard	1.25

Willis Park Row B. Co., New York City.

The Ferris and Elmore bicycles shown by this firm are fitted with Sunbeam spokes, a novelty which seems to have struck the fancy of a good many bicycle makers, and which undeniably adds to the general attractiveness of a bicycle. A complete line of sundries and tires is also displayed.

Model.	Style.	Retail Price.	Wt., lbs.
Ferris, men	Chain	\$38	22
Ferris, women	Chain	38	22
Elmore, men	Chain	40	24
Elmore, women	Chain	40	24

R. H. Wolff & Co., New York City.

The skill which this firm has acquired in the working of steel has resulted in its special application to bicycle frame construction. The frames of all Wolff-American patterns are spring tempered and if they should be deflected, will readily spring back into place. The frame stock is tempered to a straw color. The bearings of the machines are self-lubricating and are constantly run in oil. The readiest way to express an opinion concerning Wolff-American bicycle manufacture is to state that all the models are high priced, which in itself is equal to intimating that the goods are of high grade. The Morrow brake will be fitted to any machine for \$10 extra.

Coleman-Dunlop Injunction Case.

The following letter has been received from the American Dunlop Tire Company in explanation of the attachment on its property secured by the Western Wheel Works:

To the Editor.—In view of seriously misleading reports having been circulated in the trade respecting this company, which unless corrected may create a wrong impression regarding our ability to meet our obligations, we beg to state that these reports have no other foundation than a suit which has been instituted against not us, but the Dunlop Pneumatic Tyre company, Ltd., of London, England; and the plaintiff, believing that we had in our possession money or property belonging to the English company, has served a writ of attachment on all money and property thus alleged to be in our hands.

So far as we are concerned, the effect of this suit is merely that we shall pay to either the plaintiff or to the defendant whatever we may have, owing to the latter. During the six years of our existence we have made a practice of discounting our bills, and are prepared to continue to do so.

## COMMERCE IN FOREIGN MARKETS

**HOW TO HOLD SCOTTISH TRADE**

In Scotland, American manufactures, with few exceptions, are regarded as above the average in point of quality. To be more specific, the articles of American make sold, either to a large or a limited extent, have gained acceptance on account of quality rather than on account of comparative cheapness. It is distinctly true, therefore, to say that our products have obtained favor in Scotland and are gaining favor on their merits. Generally speaking, it is considered in Scotch communities that to say an article is American is to commend it. The exceptions are not yet conspicuous and are confined to certain grades of bicycles thrown on the market a year or two ago.

In the interest of American trade in Scotland, it is a matter of the utmost importance that our manufacturers maintain the reputation they have earned for high quality of material and workmanship. Perhaps there is no other market where good quality counts for more than it does there. It is the essential thing, and, if united with a moderate price, it secures trade. Finish may be quite important, but the chances are that a bad article well finished will have a scant sale and soon drop out. To gain a profitable trade and to hold it, a manufacturer must offer an article of solid merit and keep it up to the original standard. Finish and what is rather indefinitely termed "style," and anything else designed to render wares attractive, are of permanent use only in helping the sale of an excellent article. It is doubtful if any American manufacturer would profit in Scotland by lowering the grade of his product to meet competition in the price. On the other hand, if he keeps up the grade, his rival, who resorted to the "cheap and nasty" tactics would be the loser in the end.

**TO INCREASE OUR CHINESE TRADE**

The proposition to establish an American-Chinese chamber of commerce at Shanghai, to which point many American bicycles are shipped, where both American and Chinese goods could be shown to advantage, would be the most practical method of increasing our trade quickly and permanently not only with China but with the whole Orient.

If the United States wants to increase its trade and commerce with China, let congress repeal, or at least modify, the Chinese exclusion laws, and make an appropriation of \$250,000, to be repaid in thirty years, with interest at 2 per cent. per annum, for the purpose of erecting and maintaining a permanent exhibition upon the United States reservation at Shanghai, to be conducted under the auspices of some institution whose sole object it is to develop our trade and commerce in that part of the world.

The Chinese are now buying bicycles and phonographs in large quantities, and none were sold until samples were exhibited. We can not expect to sell our goods on description. It seems that an exposition at Shanghai is almost necessary to direct connection between the American manufacturer and the Chinese merchant and consumer.

Many makers have been content to do business in a half-hearted way in Asia, and have not taken the trouble to make themselves acquainted with the banking methods, the shipping methods, the various laws in force, the climate, the superstitions, and the details of the needs and

customs of the people. The Chinese are peculiar people, who will buy nothing if they cannot get exactly what they want, put up and labeled as their customs and superstitions dictate. The supply must fit the demand.

Our people do not realize their opportunities there. A Chinese viceroy, who is considered antiforeign, stated a short time ago that he was always willing to have Americans come into his viceroyalty to open mines, establish manufactures, and do any kind of business, but he did not want other foreigners. "But," he said, "Americans do not ask for these things, while other foreigners are always asking for them."

No foreign merchant in China will sell American goods unless he can make much more money out of them than he could from similar goods from his own country. If American manufacturers expect to handle this market as their situation entitles them to do, they must be represented by Americans.

### RUSSIAN MARKET DEVELOPING RAPIDLY

There is a general desire on the part of Russian merchants and dealers to make connections with American manufacturers, provided this can be done advantageously; but as a rule American houses have a general agent in England or Germany, who supervises their business for Europe and appoints sub-agents for Russia and other countries, and takes three-fourths of the commission. Russian agents object to dealing through an agent in London or Hamburg, and very much prefer to deal directly with the home company.

The surest and best plan to introduce goods into Russia is to send samples by a thoroughly competent representative of the business it is proposed to push. St. Petersburg is but twelve days' travel from New York.

American consuls in Russia are in receipt, by every steamer, of letters and circulars from American manufacturers, museums, and export associations, making inquiries as to the prospects and methods of procedure, names of dealers, etc., to introduce their goods; but purchasers naturally desire to see and examine any article they are asked to purchase.

The Russians have respect and admiration for the inventive genius of the Americans, and, while conservative, they are always willing and anxious to look into new inventions from the United States. Articles of American manufacture are preferred, with few exceptions, to those manufactured in England, Belgium, and Germany, our principal competitors.

The commercial relations between the Russians and the people of the United States were never so friendly nor strong as today, and they are growing closer each year, by reason of better acquaintance and largely increased business relations.

The United States Steamship Company, of Copenhagen, has decided to establish a line of steamers between New York and Russian ports. This company has sent one vessel to New York and Boston and will soon send another. The establishment of direct communication will place our manufacturers on the same basis, except as to distance, as Germany and England. American goods sent to Russia are handicapped by the cost and delay of reshipment at Hull, Hamburg, or Bremen, and the cost of transportation from the two latter ports by rail. The

Russian government is now building an ice boat with 10,000 horse-power, being the largest vessel of that character ever built, with which it is proposed to keep open the ports of St. Petersburg and Riga during the winter months.

By a recent convention the international money order system between the United States and Russia went into effect on January 1, 1899.

### COMMERCE AND MANUFACTURING IN JAPAN

Yokohama and Kobe are the leading Japanese ports of entry — Yokohama for Tokio and Kobe for Osaka and Kyoto, inland cities. There are fifteen or twenty large houses doing an import business, three or four of them Japanese and the rest foreign. It is not good policy for American manufacturers to deal direct with the natives. The foreign houses are responsible and reliable, and they have branches in such important places as London, New York, etc. Inquiries made direct by native merchants are mainly for the purpose of beating down some dealer of whom they are customers in a regular way.

Patents and trade marks can be obtained by Japanese or foreigners with equal facility now under the new law, which is a result of recent treaties. This applies only to articles which have not previously been manufactured in Japan. The Japs do not like foreigners any more than the Chinese do, but they are clever enough to be willing to take all the knowledge and experience the foreigners will give them. Their watchword is, Japan for the Japanese.

Japanese manufacturing, when conducted under purely Japanese auspices, is not systematic and economical, but a number of foreign houses have gone into the country and have shown Japanese firms how to produce goods in the European manner. The result is that the combination of foreign system and the astonishingly low wages of the natives is quite sufficient to drive a foreign manufacturer out of the country.

### GERMANY'S CYCLE INDUSTRY

German bicycle manufacturers make large profits. According to the reports of the respective companies they pay 20 per cent dividends or more. At present there exist about 150 bicycle makers, of which 25 are on a large scale and 25 of medium size. The capital invested is estimated at \$0,000,000 marks and the number of workmen employed at 40,000. To this must be added the various auxiliary and supplementary trades of the bicycle industry.

French cycle manufacturers compete with the Germans, especially in Alsace and Lorraine. The English import has become quite insignificant. A Frankfort manufacturer formerly imported 6,000 English bicycles per annum before he commenced to manufacture them himself; nowadays but a limited number of English machines are being imported. The reason for this may lie to some extent in the price, but, on the other hand, among wheelmen it is asserted that the English machines are too heavy.

The Philadelphia department stores are to be allowed to make exhibits at the forthcoming bicycle show to be held there. It is an open question if this is not a fatal mistake on the part of the local cycle board of trade.

## PATRONIZING FAST FREIGHT

### Exorbitant and Unjust Rates of Express Companies Drive Away Cycle Dealers' Business

Further opinions of retail cycle dealers on the subject of exorbitant charges on bicycles and small packages shipped by express are embodied in the subjoined letters. Many of these came from points far distant from the manufacturing centers, where rates are so high as to practically prohibit dealers from ordering in less than car lots, thereby compelling them to purchase almost altogether from the jobbers.

Fast freight is much favored as an alternative, many of the dealers already patronizing the railroads whenever possible, but there is some complaint regarding the slower service and the fact that the freight companies do not deliver goods at the door of the consignee. Lower express rates are universally wanted and all stand ready to adopt the course that seems most likely to bring about the reduction.

#### All Things Cheaper but Express Rates.

Everything is cheaper than it was years ago except the express charges—they do not change. I have a good deal of express business and the charges are extravagant. My stuff could be carried with a good profit if the charges were reduced 50 per cent. Take castings, there is no way of damaging them in carrying; then why don't machine companies take hold of this and endeavor to get the charges cut down? I do not think we could use fast freight for local shipments. If the express companies are not willing to do what is right, the only resort is to fight them every way we can. Why does not the government carry larger packages in the mail to avoid the extravagant express charges? But the postal authorities will take only certain packages. I think it would pay the government to carry larger packages and small castings.

North Manlius, N. Y. D. D. COSTELLO.

#### Ships All Things by Freight.

We have troubles of our own that the dealers east of the Missouri river know nothing about. We ship everything by freight. Small packages, often of fifteen pounds, shipped from Chicago by freight cost only about half as much as by express and it takes only a day or two longer. We have had just as many bicycles damaged when shipped by express as by freight.

Central City, Neb. HASTINGS BROS.

#### Thinks Parcels Post Best.

We are heartily in favor of the work taken up by The Cycle Age in regard to the express companies, as it is the only way that something can be accomplished. Enough has been said in regard to prices charged, but certain it is that radical changes have been made on account of the bicycle. Some changes are necessary with the express companies, but it would be better still if we could get postal freight.

Livingston, Mont. CULLEY & LEWIS.

#### Coast Dwellers Suffer Severely.

It costs about \$6 by express and \$3 by freight to lay bicycles down here from Chicago. In amounts less than carload lots express takes from four to seven days and freight from ten to thirty. We should be able to receive machines on the coast by fast freight from Chicago in from five to seven days at a maximum cost of \$2. Will be glad to do what I can to help bring rates and time limit to where they should be.

Oakland, Cal. BURTON C. LUND.

#### Do Not Stick to Rates.

The rates charged by the express companies are exorbitant, and should be avoided if possible by all tradesmen throughout the country. On several occasions, the charges on packages being very high, we have protested against them and by the use of scales found that the companies do not in all cases adhere strictly to their rates. The idea of supplementing express with fast freight is a good one in our opinion and should receive the support of all business men. Any method which is at all reasonable will be

preferable to the express companies, and the sooner adopted the more profitable will it be.

Knoxville, Tenn. BIDDLE CYCLE CO.

#### Fewer Breakages Offset Slower Time.

We are glad to see the Cycle Age at the head of the fight against the present express rates. Some years ago we found that we really got better service from the freight companies. They bring goods in better shape. Our only damages have been through the express offices. The matter of time is often offset by the better condition of the goods.

Carthage, Mo. PEBBLES CYCLE CO.

#### Perfect System of Organized Robbery.

The express rates are so high as to be a serious problem with us. We have for the past year had goods shipped by freight whenever possible. The leading express companies parcel out the country in such a net as to avoid competition and goods frequently pass through two or more companies before reaching us, and each company collects its full rate. We certainly hold up both hands for any movement tending to make express rates less like highway robbery than at present.

Somerville, N. J. GARRETSON CYCLE CO.

#### Send Small Packages by Registered Mail.

We are in favor of fast freight or anything that will make the express companies reduce their most unreasonable charges. We have paid out enough in the last year to buy a small farm. We send lots of things by registered mail to avoid the express company as much as possible.

Tecumseh, Neb. WILLS & SPAULDING.

#### Freight Service Too Slow.

While we believe that the express charges are too high and would be glad to have cheaper service, we must use express for the reason that freight is very uncertain. Goods that are out twenty-four hours by express would take from two to three weeks if sent by freight. Short trips, one line through freight, is all right but when goods have to be handled over several lines it is very unsatisfactory. Our only complaint against the express companies is that they make 40-pound packages weigh fifty pounds but never the reverse. Taking it as a whole, the express companies are very accommodating and we believe that they give the best possible service.

Washington, D. C. W. E. BAUM & CO.

#### Full Rates to Two or More Companies.

We are certainly in sympathy with any move that will tend to the reduction of express charges. We think, however, that the fast freight proposition is the best way to get at the matter. The worst complaint we have to enter is the practice of making a full charge for each company, where the package is carried by two companies and is above a certain weight. This in some instances with us has made the expressage cost us more than the cost of the goods.

San Diego, Cal. NOLAN & TIBBALS.

#### Better Protection by Freight.

I think a fast freight would be better than express, providing it was as safe, for it would give the merchants better protection for a while at least.

Marshfield, Ore. E. E. NELSON.

#### Take Advantage of Revenue Stamp Act.

The extortionate charges of the express companies are positively outrageous and I never employ their services if I can help it and would most assuredly patronize fast freight in preference. Am satisfied that the agents of the express companies are taking advantage of the government in the stamp act in ways that the government little thinks of. For instance, they never forget to make the customer pay the one cent extra for revenue stamp for receipt, but often neglect to give the receipt. How is that for fraud?

Spencer, Ia. C. E. ADAMS.

#### Glad to Assist the Movement.

Most assuredly we are in sympathy with and will hail with delight any movement that will release the small merchants from the "stiff necked tyrant." If using fast

freight will assist the movement, we shall be only too glad to enter the combine to use fast freight in every case, with the exception of course of a special rush. Our specific complaints against the practices of the express companies would be simply repeating what has been already written, therefore, we refrain from ventilating our "special grouch."

Portland, Ore.

DENTON & CO.

#### Made Special High Rate on Bicycles.

We are most certainly in sympathy with the movement, as every other cycle dealer must be who has suffered from express extortions. The charges are heavier on us as we are so far from the markets. For some time we have been having bicycles shipped from New York to Savannah, Ga., by boat, care of Southern Express Co., to be brought by them to Tampa. When this arrangement was first made the rate from New York to Tampa was \$1.75 per 100 pounds, so that two crated machines of average weight could be got here for \$1.75. This was not enough for the transportation companies, so they shortly changed the rate to a special one of \$1.25 per bicycle, an increase of 73½ cents on each machine. All rail rates to this point are practically prohibitory in our line of business, and we have as little as possible sent in this way.

Tampa, Fla.

M. A. BENJAMIN & SON.

#### Cut a Big Hole in Prices.

The immense addition to the express business which the bicycle trade alone makes should still make it profitable with a mutual reduction in rates. I paid \$200 express last year on a business of about \$5,000 in bicycles and parts and sundries. This makes a large hole in my profits. This year I have so far ordered twenty-seven bicycles, all to be shipped by freight. I calculate on saving at least \$13.50 on the lot. I do not think we have any fast freight here in Vermont, so when the season is on I shall have to express in order to save time.

Burlington, Vt.

E. FRANK LANE.

#### How Rates Vary Unreasonably.

We regard express rates as excessive, and have for a long time. We always use freight whenever possible. The rate for a single bicycle, crated, from Kenosha, Wis., is \$1.70 by express. We have had occasion to send a pair of forks to the factory by express and the rate going was 30 cents, while the charge for returning by another express company was 45 cents for the same article.

Vineland, N. J.

VINELAND CYCLE HOUSE.

#### Will Ship by Freight Hereafter.

I am in sympathy with the movement started in New York and shall use fast freight at all times, if possible.

Houston, Texas.

J. WADE COX.

#### Fifty Per Cent Variation in Charges.

Being a small dealer and having to buy in small quantities, I certainly have found out that express companies know how to charge. I have on several occasions paid more express than the goods cost, and have sent parts off to get duplicates and found that it cost 40 to 50 per cent more to get new articles back than to send off the old ones. I certainly would like to see some relief for cycle dealers.

Wichita Falls, Texas.

E. M. WINFREY.

#### Wants State Legislation on the Subject.

We are heartily in accord with the movement against the express companies. We believe in "live and let live," but we do object to paying the exorbitant transportation charges the express companies are charging us. If it were possible to conduct business without them, we would only be too glad to do so, but we have found, as every other business man has, that it is simply an impossibility, and the only hope is in getting them to reduce their charges in keeping with the times. It now costs us \$1.50 for a single bicycle from almost any point east of New York, and we think this is one of the principal reasons why the western trade is so reticent about handling wheels of eastern manufacture. Fast freight is all right if you are ordering a number of bicycles, but on a single machine the drayage, etc., amounts to nearly as much as the express. Why could not the dealers organize in different states and get the legislatures to pass laws on this vital subject, which means hundreds of dollars to every dealer? We have paid the express companies the last season over \$350.

Fort Wayne, Ind.

RANDALL WHEEL CO.

#### Bicycles in the Orient.

The attention of bicycle manufacturers is called to an advertisement in the want columns of this paper by a gentleman who desires to represent six or seven leading houses on a trip through oriental countries.

Model 20, Special, \$50.00

Model 23, Superba, \$50.00

## No Cycle Shows

Barnes Bicycles will not be shown at the Cycle Shows. A reputation based upon the production of first-class bicycles we consider more valuable and lasting than one obtained by display, therefore our surplus coin and energy will be expended entirely in maintaining the standard quality of the White Flyer.

It is a good idea for agents to go to the Cycle Show, as in olden times, just for the fun of the thing and a little diversion from business cares, but when they return to their stores with clear heads and slightly depleted purses they will realize that fun and fancy display are all right for *one* week, but for the other fifty-one weeks of the year the bicycle that *always* has the *quality* and *style* is the one that insures the replenishment of their pocket books and ultimate success.

We have many more agents than ever before, and still the list swells. We are too busy for Cycle Shows, but will be glad to mail our beautiful 1899 Catalogue to any who may apply.

• • The Barnes Cycle Company • •

Model 29 Road Racer, \$65.00

## SUBJECTS OF GENERAL INTEREST

### KEELY'S PROBABLE MOTIVE FORCE

Since the recent death of John W. Keely, of Keely motor fame, the interest of the engineering and scientific world has been reawakened in the mystery of the force that drove the motor with which this notorious inventor succeeded in securing investments of capitalists through more than a score of years, although the "motor" never turned a wheel commercially. In order to probe the secret of the Keely motor, an investigation of the dismantled workshop of the inventor in Philadelphia has just been made by Professors Herring, Goodspeed, Witmer and Dr. Miller, respectively electrical engineer and teachers of physics and experimental psychology.

The investigation was most thorough, every bit of flooring was ripped up and every nook and cranny explored under the flooring and under the walls. The debris left between the joists and in barrels was sifted, and no opportunity to find tell-tale evidence was missed.

The large steel ball weighing three tons, which had played an important part in Keely's experiments, was found imbedded in the clay of the basement, and short sections of metal tubing of the high pressure kind, with joints apparently made to withstand internal pressure, were found among the rubbish left after all the important machinery and materials had been removed by the Keely company, led to the presumptive conclusion that the mysterious force was, as had been strongly suspected in 1888 and 1889, compressed air.

As the investigation made clear, there was perfect communication between this cavern, in which the big sphere lies imbedded in the earth, and the upper room, in which, among other apparatus, near the door, stood the lever machine. The communication was by auger holes of various sizes in the flooring and in the ceiling.

This tubing did not look unlike heavy wire, and, in fact, was exactly the same size as some heavy brass wire found on the premises, which is of interest, since Keely claimed that he used no tubes whatever, his lifting force being communicated through wires.

In the light of the discoveries made, it seemed clear to all the investigators that he could just as easily have performed his lifting trick by using compressed air and transmitting through some of the tubes found under the flooring and in the doorsill so conveniently near to the lever machine. It was estimated that the steel sphere would easily withstand internal pressure of 1,000 atmospheres.

### AN INTOLERABLE SITUATION

The interstate commerce law cannot be enforced. The commission appointed to administer the law has so reported to Congress—a stale annual confession—and adds that until further and important legislation is enacted the best efforts at regulation must be feeble and disappointing.

Meanwhile the situation has become intolerable both from the standpoint of the public and the carriers. Tariffs are disregarded, discriminations constantly occur, the price at which transportation can be obtained is fluctuating and uncertain. Railroad managers are distrustful of each other, and shippers all the while in doubt as to the rates secured by their competitors. The volume of traffic is so unusual

as frequently to exceed the capacity of equipment, yet the contest for the tonnage seems never relaxed. Enormous sums are spent in purchasing business, and secret rates accorded far below the standard of published charges.

The general public gets little benefit from these reductions, for concessions are mainly confined to the heavier shippers. All this augments the advantages of large capital and tends to the injury and often to the ruin of smaller dealers. These are not only matters of grave consequence to the business welfare of the country, but they concern in no less degree the higher interests of public morality.

A large part of the railway business is now transacted upon illegal rates, and in certain quarters charging the published rate is the exception. The results are gross discriminations between individuals having gross preferences between localities, which most always favor the strong and oppress the weak. Probably no one thing today does so much to force out the small operator and build up those trusts and monopolies against which law and public opinion alike beat in vain as discriminations in freight rates.

A further result is that railroad business is carried on largely in conceded violation of law. This condition the present law is powerless to control. The criminal remedies have been applied and some convictions have been had, but no substantial effect has been produced and no satisfying results can be obtained from that course. The fact may be morally certain, but the name, the date, the amount, cannot be shown with the particularity and certainty required by criminal law.

### AFRICAN TRANS-CONTINENTAL RAILROAD

The richest part of South Central Africa will be tapped by a railway impinging on Lake Tanganyika, and having its terminus at Cape Town. The main road into and through Africa will continue to be that from the south to the north, with a prospect of one day joining hands with the Soudan railway and also with the other great highway that is being made from Mombasa to Uganda. As regards the first of these schemes, it is calculated that in order to connect the cape with Cairo there remain to be completed a maximum of 1,000 miles of railway. Already 2,730 miles have been constructed. The railway to Khartoum will be 1,200 miles in length, and from the cape to Buluwayo 1,530. Of this 1,000 miles of railway to be constructed it is announced that a contract has already been placed for the portion from Buluwayo to Kariba gorge.

Cecil Rhodes is now in London working industriously for the success of this project and is reported to be meeting with financial encouragement.

The line from Buluwayo to Khartoum is estimated to cost \$47,000,000. Rhodes has been assured of \$10,000,000 for the section from Buluwayo to Lake Tanganyika, and the remainder can be secured when the surveys from Tanganyika to Khartoum are made.

Among the many articles made from cork waste is the familiar cork grip for bicycle handles. By a secret process the waste is pressed into the required shape, and, strange to say, the grips thus made are stronger and more durable than those manufactured from cork wood, although the latter gives a much smoother finish.

### TECHNICAL EDUCATION IN GERMANY

German tradesmen and manufacturers are alive to the importance of increasing the efficiency of their mechanics and artisans, and improving the quality of their goods. They are resolved that "made in Germany" shall no longer pass as a term of opprobrium, but be a synonym of excellent materials and good workmanship.

As a first move in this direction, a conference of influential manufacturers, business men and municipal and provincial officials, delegates from chambers of commerce, workingmen's unions and manual training schools, etc., was held at Hanover on December 8, under governmental sanction and direction, to discuss German trade and manufacturing interests and devise plans for their extension and improvement.

As a result of the conference, it was unanimously resolved to establish at once in the city of Hanover advanced lecture courses, in which artisans and apprentices in all trades shall have an opportunity to complete their mechanical education and be instructed by experts how to install and manage a model workshop and work and use machines and tools to the greatest advantage.

The cost of the establishment and maintenance of the lectures is to be supplied by the general government and that of the province and city of Hanover, together with the trades unions, the chamber of commerce, and others interested therein.

The establishment of these courses of lectures is the initial move in a general plan to be inaugurated in all the main labor centers of Germany, dependent upon the success of this experiment.

A permanent exposition of all power machines and tools used in the small trades is to be established in the industrial hall at Hanover. The machines exhibited are to be worked by competent mechanics, who, on request, will exhibit their uses and management to all inquirers.

In order to enable small manufacturers and tradesmen to purchase their raw materials at wholesale prices and to facilitate the sale of their products, the formation of co-operative stores at designated places is to be encouraged.

The expositions of tools and machinery proposed to be established in connection with the lecture course should offer an excellent opportunity to American manufacturers to make exhibits.

### TO CONNECT CAL- CUTTA AND LONDON BY RAILWAY

The transcontinental railway scheme to give a route across Asia from north to south has been revived in India. The latest plan is to extend the railway system of the empire to Kandahar and Kabul to connect with the Russian railway. This would make Bombay and Calcutta the outlets for Russian commerce in Asia, and enable travelers from London to reach India in ten days.

A German inventor has recently patented in the United States a sand blast apparatus for bringing out the grain in wood for decorative purposes.—American Machinist.

Russian cycle manufacturers have petitioned their government to levy the same tax on bicycle frames as on finished bicycles.

## ADLAKE BICYCLES

ARE ORIGINAL AND DISTINCTIVE

**T**HEY possess features of special merit peculiar to themselves. Particular attention is called to the "Special Hub." These hubs are turned from solid bar-steel, five pounds of which are used in making a five-ounce hub, the difference being the waste. Cups are turned from solid bar tool-steel of special brand, and screw into the hubs. They are locked in place by locking collars which screw onto outside of hub.

Cones are also turned from the same tool-steel and are screwed onto axles against shoulders. They are then carefully ground and polished. Cups are made ball-retaining by spring washers and are also carefully ground and polished. Right-hand cups are screwed in against shoulders and remain stationary. Adjusting is done by the left-hand cups and collars. Cones always remain stationary and the whole construction is dust-proof. Sixteen  $\frac{1}{4}$ -in. balls are used in front hub and sixteen 5-16 in. balls in rear. Thirty-two piano wire spokes are used in front wheel, and thirty-six in rear.

The wide-awake agent will handle only lines with distinctive and up-to-date features. Adlakes have them.

## RECENT PATENTS

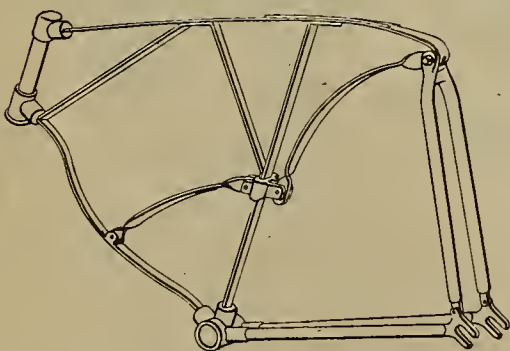

## Device for Cushion Frame Converts Who Own Rigid Bicycles—A Tire Repair—Adjustment Without Tools

**Cushion Attachment.**—The invention, while it belongs to the familiar type of spring devices in which the wheel axles are free to play up and down in a vertical guide way, is remarkable by its neat appearance and because the attachment may be put onto any standard pattern bicycle without necessitating alterations. An oblong guide piece is provided for

each end of the wheel axle, and has a rack on one side of the guide slot, meshing with a spur pinion placed on the axle. On the extreme ends of the axle are placed small stationary rollers which receive on their upper sides the rear ends of round wire springs, the forward extremities of which are coiled and fastened to clips clamped to the rear fork tubes of the frame. The guide pieces are secured to the bicycle frame by means of flat forward extensions, which are bolted to the rear fork end lugs. The bolts used for this purpose take the place of the rear axle and nuts used when the wheel is placed in the frame in the usual rigid manner. Adjusting screws turning in the heads of the bolts which clamp the guide frames to the bicycle frame impart a longitudinal movement to the former and allow the chain to be adjusted. Slender supplementary frames brace the attachment between the securing bolts and the clamping clips. Similar attachments are applied to the front forks, though, of course, the adjustment features are not needed. The inventor is Charles Cretors, Chicago.

**Spring Frame Design.**—Design patents have been granted J. L. Knoll, Lebanon,

Pa., on an anti-vibratory frame the main feature of which is a system of flat spring bars connecting the front and rear ends of the frame and supporting the saddle. The illustration shows a frame for men.

**Seat Post Adjustment.**—The post is designed with the idea of dispensing with wrench and other tools for adjusting purposes. The horizontal saddle support is

hinged at its rear end to the post and has a lug on its lower side in a position that is normally central with the vertical post and which forms one part of a hinge joint, the other section of which is the upper end of a rod which carries an expander piece at its lower extremity. The lower end of the post is split to be expandible and has several longitudinal grooves pressed in its outer surface which form tapering ribs on the inner wall. The ribs taper into the wall of the tube at their upper ends, so that by lowering the expanding piece the split end of the post is expanded to bind against the seat mast tube of the bicycle frame. The operation of the post consists in pushing downward upon the front end of the hinged horizontal saddle support when it is desired to tighten the post and in raising the front of the support when the post is to be loosened. A locking device is added, which consists of a spring latch catching the lower back edge of a central hole bored in the horizontal bar. This catch is pushed back out of the way, when it is desired to loosen the post, by a rod which slides in the hole and is operated by a half-round head which may be pressed with the thumb or finger. A short coil spring keeps the sliding rod away from the catch when it is not in

use and a slightly spun-over edge on the horizontal bar retains the rod in place. The exact location of the expanding piece on its rod is not fixed, the expander being screwed onto the rod, and can thus be raised or lowered, so that it will expand the post properly within the range of movement obtained through the hinged saddle support. A similar contrivance is applied to handle bars, the entire bar being tipped laterally on the machine to accomplish the loosening of the expander. The inventors are C. S. Irish and P. V. Markell, Jordan, N. Y.

**Band Repair Tool.**—The tool is an improved form of instrument for closing punctures in single tube tires by the band method. It comprises mainly a handle piece with long slender shank on the end of which is a needle with an open-ended slot at its extremity. The back end of the flattened portion forming the slot is inclined to facilitate the work of removing the needle from the tire after the bands have been inserted. A cylinder with reduced upper end fitting the shank of the tool surrounds that shank and may slide upon it, though before a repair is started the cylinder is placed at its highest point near the han-

dle end of the tool and held in that position by a small thumb screw. The upper ends of the bands, which are hooked in the slotted needle, are held by pins on the lower end of the sliding cylinder. The lower extremity of the sleeve is flaring, forming a bell shaped mouth. After the needle and bands have been inserted into the tire the thumb screw on the sleeve is loosened and the latter lowered till the flaring mouth touches the tire. The bands will thus be loosened and will

fall from the retaining pegs and the flaring mouth of the sleeve, if pressed upon the tire, will aid in keeping the bands from coming back out of the puncture when the needle is withdrawn. The inventor is C. E. Kelly, Greentown, Ind.

**Sayres' Adjustable Bar.**—The central collar around the bar is provided with several radial recesses and also a central annular groove or guideway. Inside of the stem is a longitudinal sliding shoe, the upper end of which is formed so that it may engage any of the recesses in the bar collar. A coil spring surrounds the shank of the shoe and rests on the bottom of the stem. In the side of the stem near the upper end is placed a latch lever, by means of which the shoe may be lowered at will. The shoe normally engages one of the recesses in the bar, but when the rider pushes the outer end of the latch lever upward the shoe is lowered and the bar may be swung around to any desired position, when upon releasing the latch the shoe will engage the recess which is then adjacent, and the bar will be locked in the new position. The annular guideway mentioned keeps the bar from sliding laterally in the head stem, while an adjustment is being made. It also keeps the bar from

being pushed through the stem head, and so the latter has to be made in two sections, bolted together with outside lugs and binding screws. The inventor is G. F. Sayres, Milnesville, Va.

## Patent Office "Catching Up."

## SPECIFICATIONS

**Frame**—Made of 1½-inch Shelby Seamless Tubing. Choice of 21, 23, and 25 inch.  
**Joints**—All flush, properly reinforced.  
**Fork Crown**—Vim arched, forging, spear-head pattern.  
**Crank Axle**—Genuine Fauber one-piece.  
**Cranks**—Diamond pattern, 7-inch throw.  
**Drop**—2½ inches.  
**Sprockets**—Star pattern; front 18 to 30, rear 7 to 10.  
**Gear**—Choice of 68 to 120.  
**Wheel Base**—43¾ inches.  
**Tread**—4⅞ inches.  
**Wheels**—28-inch.  
**Spokes**—Swaged, tangent, 32 to front and 36 to rear wheel.  
**Rims**—Rastatter, choice of plain, natural finish or colored.  
**Hubs**—Our own make, style "A".  
**Bearings**—All made of tool steel, ground, hardened and polished.  
**Seat Post**—Flush L pattern, tubular, with tubular saddle bar; very latest.  
**Expanders**—In handle bar—Chicago Handle Bar Co.'s eccentric make; one that will hold.  
**Chain**—Baldwin, highest grade 3-16-in.; B block detachable; polished.  
**Chain Adjuster**—Direct.

**Handle Bars**—27-32-inch; choice of any style made by the Chicago Handle Bar Co.; steel up-turned, dropped, ram's horn, Schlaener pattern or steel adjustable, all of the most graceful designs. Octagon tube bars 50 cents additional.  
**Pedals**—Vim, with or without rubbers.  
**Saddle**—Gilliam No. 59, Brown racing pattern, as shown on model "30," or Gilliam No. 46, Gordon pattern, with or without coil springs.  
**Tires**—Our own make; guaranteed for entire year; punctures repaired free.  
**Enamel**—Choice of Maroon, Green, Blue or Black, delicately striped. We use only the best quality of enamel of highest lustre and durability; all bright parts heavily nickel-plated.  
**Weight**—20 to 26 pounds, according to size of frame and sprockets used, regularly equipped with tool case, wrench, oiler and repair kit.  
**Frames**—Our frames are made of the best seamless tubing the Shelby Steel Tube Co. can produce. Built on the most approved lines; short head; 2½ to 3 inches drop to the crank hanger; a strong and rigid frame, graceful in design. Every joint is a steel forging, machined. For strength and rigidity our frames are unsurpassed.

There are positively no stampings, castings or brazed tubes used in these Bicycles. Do not compare our prices with those of wheels so made. We challenge any manufacturer to produce a bicycle of same material and workmanship for less money.

## VIM BICYCLE COMPANY, Incorp., CHICAGO, ILL.

Good Agents Wanted in Unoccupied Territory. Write to-day. Catalogue for the asking.

effect of this has been to greatly improve the condition of the work, as shown by the following figures: On December 28, 1897, there were 11,382 applications for patents awaiting action, while on December 27, 1898, the number then awaiting action was only 5,467. At the end of the year 1897 the divisions were in arrears from five weeks to seven months, while at the close of 1898 thirty-five of the thirty-six divisions were in arrears only six weeks on new work and fifteen days on amended work, and the remaining division will be up to them within two weeks. The total receipts of the Patent Office during the year were \$1,137,734.48, while the total expenditures were \$1,136,196.20.

### AMERICAN IDEAS DOMINATE

#### French Are Close Imitators of New World Construction—English Abandon the Field.

Aside from the great showing of motor vehicles, the features of the Paris cycle show were the complete dominance of American machines and ideas and the unexpectedly good showing made by chainless machines, according to an American trade visitor. So plainly in evidence were these two features that even the most biased critic could not fail to be impressed by them.

The show was almost like an American show. French and American cycles preponderated, but it was not always easy to distinguish one from the other. The latter are now looked upon as leaders. Sometimes they are copied outright, and at other times the attempt is made to produce composite machines. Even in the latter case, however, American characteristics come to the front. British makers have about abandoned all hope of competing in the French market. They appear to recognize the fact that the tide is running away from them, and rather than acknowledge its influence by modifying their patterns, they choose the part of abscission.

In the meantime American machines continue their steady progress. There is no fear that the pace cannot be kept. We are not apt to neglect an advantage once gained, especially in a case where we are so much in earnest as in this one.

#### No Purchaser for Warwick Plant.

J. H. Hendrick, one of the assignees of the Warwick Cycle Company, says that there is at present no prospect of opportunity to dispose of the idle plant. The assignees have yet a number of months in which to sell the factory, as last March they were given eighteen months by the court for their task. Mr. Hendrick says that the plant will not be "slaughtered," and that the low water price of \$100,000 has not been changed.

#### Rack Company Changes Name.

The Chicago Bicycle Rack Company, Chicago, has certified to a change of name to the Wallingford Manufacturing Company, increase in number of directors from three to five, and to change of object of incorporation to general manufacturing.

#### Harveyized Steel in Bicycles.

To an inquirer who desires to know what Harveyized steel is, and wherein the process of Harveyizing consists, the American Machinist gives the following answer, which may be of interest to those who see the term used in bicycle catalogues: It consists of nothing much or essentially different from the old, familiar case hardening process. The plates to be hardened are simply packed with bone charcoal next to the side it is desired to

harden, heated and kept hot for the absorption of carbon by the plate, which is then removed, placed upon suitable supports and numerous small jets of water projected against the surface to be hardened."

### RETAIL TRADE CHANGES

#### Iowa Dealer Installs Complete Repair Shop—Transfers of Business in Other States.

W. H. Senter has sold his bicycle agency business in Brockton, Mass., to Wesley Snow, who will conduct the business in the same place.

The bicycle and sporting goods business of G. G. Jackson, in Wichita Falls, Tex., has been purchased by E. M. Winfrey. Mr. Jackson will act as salesman.

W. D. Heath has succeeded the firm of Munsey & Heath, who for the past five years have conducted a business in bicycles and bicycle sundries in Lakeport, N. H.

George E. Bagg, formerly employed by Hendee & Nelson and later a member of the firm of Holden & Bagg, of Springfield, Mass., died suddenly at Albany a fortnight ago.

C. E. Adams, who has conducted a furniture store in Spencer, Ia., handling bicycles as a side line for the past four years, has now sold his furniture stock and will hereafter confine his attention to the sale of bicycles and to repair work. He has installed lathes, forges, enameling ovens, vulcanizers and all necessary tools to make any part of a bicycle.

#### English Rear Fork Ends.

The accompanying illustration shows a new rear fork end lug recently offered to the English trade. The object of the fitting, as may be seen from the illustration, is to afford ready means for removing the rear wheel without separating the

chain. The lower side of the fork is hinged to the lug and when the set screw which holds it in its normal position is removed the entire rear wheel, together with the chain adjusters and nuts, will drop from the frame. Suppositiously the chain adjustment will not be lost during the interval between the removal and replacement of the wheel. In reality this depends upon the looseness of the fit of the nut on the threaded shank of the adjuster. If the nut is tight, the chain adjustment will remain unaltered. If it is loose, the probability is that the nut will be accidentally turned for at least a short distance either way. The fittings do not afford as easy rear wheel removal as some of the fittings now in use in this country, as it is necessary besides loosening the axle nuts to take out the screw which holds up the hinged portion of the lug. A screw driver is required for the removal of this pin, and it is very likely to be misplaced while out of the fitting.

#### Swiss Tire Healing Compound.

From Basle, Switzerland, there comes in the form of a United States patent granted to one Jean Gaa, a recipe for

making a puncture healing compound which seems meritorious in that there is nothing in its make-up which is liable to injure the rubber in the tire. The composition is made by forming an emulsion of ten parts pulverized ammoniac gum, ten parts of powdered gum and twenty parts of water. This emulsion is then suspended in twenty parts of glycerin. The choice of gums to form the emulsion is not limited very closely, the object in using the gum being to furnish a non-injurious plastic solid which being suspended in a non-drying liquid, such as glycerin, will enter all punctures and close them before the air in the tire has had opportunity to escape. Shellac may be used after having been precipitated in the form of gelatin from its solution by means of glycerin or hydrates of carbon or a mixture of both. Vegetable or animal cellulose may be employed in a suitable disintegrated state, as well as membrane gum or guttapercha, the latter being used either raw or cured or precipitated from its alkaline solution.

### AMERICAN AND ENGLISH EXPORTS

#### Week's Shipments from New York to Germany Double Two Weeks' English Exports.

Exports of bicycles and bicycle material from the port of New York for the week ending January 17 are recorded as follows:

#### Bridgeport Dealers Co-operate.

An annual meeting of the bicycle dealers of Bridgeport, Conn., was held January 12 to determine upon a plan of cooperation the coming season. There were fifteen present, including all the prominent dealers in the city.

## COMPRESSED AIR VEHICLES

### Account of Motor Power Which Syndicates With Many Millions of Capital Mean to Exploit

For the first time in the development of the motor vehicle idea a system of propulsion has been brought under the notice of the public, which is subject to absolute control through patents; and this has been the signal for immediate aggregation of immense capital for exploiting that system in preference to any other system in which the field would be open for competition.

#### The Principal Companies.

The following companies have been organized to work the inventions of Hoadley and Knight in the use of compressed air, these inventions being protected by something like 200 separate patents on the street cars and motor vehicles taken together.

American Air Power Company, \$7,000,000; includes Whitney syndicate; controls works in New York city and compressed air street cars for United States.

International Air Power Company, \$7,000,000; works at Worcester and Providence. Controlled by the Hoadley-Leiter syndicate; will build and sell compressed air auto-trucks, engines, locomotives and automobiles.

New York Auto-Truck Company, \$1,000,000; controlled by the Croker-Hoadley syndicate; general truckmen, using International Air Power trucks. This company will own the charging stations throughout the city.

Chicago Auto-Truck Company, \$10,000,000, controlled by the Leiter-Hoadley syndicate; same business as New York Auto-Truck Company.

#### A Branch for Philadelphia.

Philadelphia, Jan. 23.—The Philadelphia Motor Wagon Company, the principal office of which is at No. 117 Federal street, Camden, N. J., was incorporated under the laws of New Jersey last Saturday with a capital of \$1,500,000. The object of the corporation is the manufacture of self-propelled wagons and other vehicles. The incorporators are Cornelius W. Woodward and William J. Jackson, of Philadelphia, and Josiah S. Dubois, of Camden. The new concern is supposed to be connected with the recently formed Cramp-Hoadley syndicate of New York, but in answer to inquiries in this direction the Cycle Age correspondent was referred to ex-District Attorney George S. Graham, counsel of the new company, who, however, could not be found.

Another company of a similar character about to be incorporated is the Philadelphia Auto-Truck Company, with a reported capital of \$10,000,000.

#### Secrecy of Proceedings.

The gigantic system of amalgamated companies which it is evidently the intention to form is yet in that stage of formation in which part of the information vouchsafed is more or less doubtful and in part self-contradictory. A New York correspondent writes in Chicago Tribune of Tuesday, January 24, in part as follows:

Mystery surrounds the New York Auto-truck and the International Air-Power companies. Among the directors of these allied corporations are Richard Croker, Senator Gorman, Nathan Straus, and Lewis Nixon. Joseph Hoadley is president of both.

The American Air-Power company is owned by the Metropolitan Traction company. President Archibald A. McLeod of the American said today:

"I know nothing of the Autotruck. The

Hoadley-Knight companies have nothing to do with the American. We are building air motors for the cross-town lines. Our cars run. We are not trying experiments."

Told what President McLeod had said, President Hoadley replied:

"That is true. The American is owned by the Metropolitan. The Autotruck and International are our companies. We have no plant in this city. Our works are in Worcester."

Can the autotruck turn a sharp curve? President Hoadley was asked about this, and permission was asked also to send experts to his plant. He said:

"The public never will get any description of our autotrucks till we have them running on the streets of this city. The turning of a curve is the whole problem. We have solved it; no person knows how except myself and the inventor. We keep our workmen in ignorance. When the time comes I will give

I. This shop tricycle has, as I was informed, about the same construction of engine as that proposed for the auto-trucks. Some very successful experiments have also been made with compressed air driven street railway cars, and it is the favorable results shown by these street cars and the Worcester heavy tricycle truck which are at this time attracting capital so strongly to investment in these compressed air propulsion schemes. The engraving given of the Worcester tricycle truck shows its general construction sufficiently to render a particular description needless.

Although the auto-truck managers say that there is more than one auto-truck completed, no photograph of this vehicle is yet obtainable. I have, however, secured a tolerably complete verbal description of details, which is here given:

#### Particulars of Standard Pattern

Motive power, compressed air, 4,000 lbs. per square inch.

Dimensions of truck platform, 12 feet long and 6 feet wide, wholly unobstructed on the upper surface.

First Hoadley-Knight Auto-Truck.

a description of the machinery, and not till then."

#### First Authentic Description.

In view of the magnitude of the deals which are under way and their possible influence for the advancement of automobilism, the representative of the Cycle Age has been at pains to gather all the information in regard to compressed air vehicles which seemed to be of a reliable nature. He writes in substance as follows:

#### The Hoadley-Knight Auto-truck.

Partial information as to the mechanical details of the Hoadley-Knight auto-truck are at last available, but they do not vary greatly from what has been open to the public for a long time in the Hoadley-Knight compressed air driven street cars.

The illustration shows a works-yard compressed air driven tricycle locomotive, built, evidently, as best it might be with materials at hand, and used for some time past very successfully in the yard at the Wheelock Engine Shops, Worcester, Mass., which are owned by one of the Hoadley-Knight companies, which has lately acquired the Rhode Island Locomotive Works, Providence, R.

Load, 5 tons, and can draw a 10-ton trailer in addition.

Weight of truck, 4,000 lbs.

Wheel base 72 inches, gauge 60 inches.

Diameter of wheels, 30 inches and 42 inches. Rear wheels only driven.

The wheels are of wood, with metal hubs, and steel tires 5 inches wide by  $\frac{7}{8}$  inches thick. The front wheels are carried on pivoted steering axles on roller bearings, the rollers being each  $1\frac{1}{2}$  inches long by  $\frac{1}{2}$  inch in diameter, hardened and ground, running on hard surfaces on the axles, and in hard bushes in the hubs. These rollers are arranged in two circles in each bearing, one circle at each end of the hub.

The engines are supplied with motive fluid from nine steel bottles charged with compressed air at 4,000 pounds to the inch. These bottles are each 8 inches in diameter by 8 feet long, made of nickel steel 5-16 inch thick, by the Carnegie company, tested to 18,000 pounds to the square inch. The bottles are arranged in three rows of three bottles each, lying lengthwise of the truck and suspended from the reach. In the truck shown in the illustration the bottles are shorter and are suspended crosswise.

From these bottles the compressed air

is led through a ½-inch copper pipe to the reducing valve. Between the bottles and the reducing valve, the ½-inch copper pipe makes three turns around a hot water heater 12 inches in diameter, 48 inches long, 3-16 thick, charged with hot water at 400 degrees of temperature, corresponding to about 250 pounds pressure. The three turns of the ½-inch copper pipe around the hot water reservoir are sufficient to heat the air passing from the bottles to the reducing valve to about the same temperature as the water contained in the hot water reservoir. Before reaching the reducing valve the air in the supply pipe receives a certain amount of lubricating oil from a drop-feed oil cup. This is the only oil cup on the wagon. It is large, and as the quantity of oil supplied to the air is extremely small, it requires filling but seldom and needs no attention whatever.

At the air valve the pressure is reduced to 200 pounds, which is the initial pressure of admission to the high pressure cylinder.

#### Exhaust is Noiseless.

The motor is a cross compound cylinder and piston engine, the pistons having a stroke of 6 inches. The high pressure cylinder is 4 inches in diameter and the low pressure cylinder is 8 inches in diameter. Air enters the high pressure cylinder at a temperature of 400 degrees and pressure of 200 pounds. The normal cut off is at ¼ stroke, and the pressure in the high-pressure cylinder is therefore reduced to 50 pounds at the termination of the stroke. Between the high pressure and the low pressure cylinder the exhaust is reheated to the original temperature of 400 degrees by injecting a sufficient portion of hot water from the heater, from 5 to 10 pounds of hot water being required per mile for this purpose. The initial pressure in the low pressure cylinder is about 50 pounds, and the normal cut off is at ¼ stroke, which results in an exhaust delivered at but little above the atmospheric pressure and temperature. This makes the exhaust nearly noiseless, and prevents it from being offensive in any manner. The cylinders are of plain, double acting, cross-head and connecting-rod construction. The valve motion is had from a wedge eccentric sliding across the shaft, and operated by a hand wheel and screw working in a journaled nut mounted on one arm of a bell crank, the other arm of the bell crank being suitably connected to the wedge eccentric which is operated thereby. A throttle valve is provided, but is not used except for stops of considerable duration. While running on the road the engines are handled entirely by the shifting eccentric, and stopped by placing it in midgear. The action of a wedge eccentric corresponds almost exactly to that given the valves by an ordinary link motion. The engines are wholly enclosed in a dust-proof casing, and all parts are lubricated by splashing from an oil basin forming a part of the casing.

The rear axle is continuous, and has secured to it a steel gear 4 inches face, 3 pitch, 63 teeth, giving it 21 inches pitch diameter. The gear reduction from the engine shaft to the axle is two to one.

#### Oiling Nearly Automatic.

One 36-inch driving wheel is secured to one end of the continuous rear axle. The opposite 16-inch driving wheel is mounted on a sleeve revolving on the axle, driven by the usual compensating gear, having two beveled pinions in the compensating gear disk. The rear axle is carried on roller bearings of the same description as those applied to the front wheels. The rear axle sleeve is also mounted on roller bearings, and all running surfaces are made self-lubricating without the use of oil cups, thus requiring no attention whatever from the driv-

er while on the road, it being only needful to replenish the main oil reservoir at long intervals.

There are no gear changes, the power variations being obtained by shifting the eccentrics.

The motor, complete with its casing and gearing, weighs about 1,000 pounds, and is rigidly connected to the truck frame. The nine compressed air bottles weigh altogether about 1,800 pounds, and the reheater weighs about 200 pounds empty.

#### Reheater Effective Five Hours.

The cylinder valves used are of the D-piston form, ¾ of an inch in diameter for the high pressure cylinder, and 2 inches in diameter for the low pressure cylinder; these valves are solid, without rings or packing of any sort. The working pistons are each fitted with two eccentric snap rings. The main connecting rods are 15 inches center to center. The reheating reservoir has a covering 4 inches thick to prevent heat radiation. This covering consists first of an air space about the reheater, next comes an envelope of wire cloth, supporting a covering of magnesia, which is in turn enveloped in a thick clothing of cow-hair felt. The reheater thus protected and charged with water at 400 degrees, will retain sufficient heat to be effective for five hours, at the end of which time it must be recharged. Such arrangements are made of charging nozzles as to permit the filling of the compressed air bottles and of the reheater, simultaneously.

The driver has only two hand-controlled operations to direct, the management of the shifting-eccentric controlling-wheel and the steering-wheel. The clearance between the lowest part of the machinery and the road surface is about 6½ inches.

The steering wheels swing through an arc of 120 degrees.

#### The Power Supply.

The normal speed is eight miles per hour. Twenty per cent grades can be ascended with a load of five tons. The range is twenty-five miles with a single charge.

It is said that auto-trucks as described can deliver to the drivers 40 per cent of the indicated power of the air compressing engine, and that the fuel cost per mile of driving a truck carrying five tons of paying load is 1 cent per mile.

To supply the auto-truck with compressed air and hot water, numerous charging stations must be provided in the territory over which the trucks are to travel. Each of these charging stations will contain an air compressor driven by about 100 horse-power, and a boiler fired to 250 pounds pressure, to supply the air heating tanks. The compressors may be driven by steam engines, or by gas engines. For various reasons the gas engines seem preferable, but nothing is positively decided in this matter as yet.

This information is directly from Mr. Knight, the chief engineer of the enterprise.

#### Few Engineering Difficulties.

The charging stations do not offer much of a problem, as they involve no engineering difficulties, and with an abundance of money and the liberty of the city which is suggested by the name of Croker, any desired number of suitable charging stations could probably be provided within ninety days from order. These charging stations do not involve any underground work, nor does a single one cost very much. It is not yet known how closely the charging stations must be placed for convenience; probably they should nowhere be more than a mile apart, and probably, also, facilities would need to be provided for the simultaneous recharging of a great number of trucks

at busy localities, such as the railway docks and steamer docks on West street.

The great points of advantage claimed for the auto-truck are its absolute cleanliness, and entire freedom from offensive product of any sort. As there is no fire and no gasoline, there is nothing to fear in the way of burning up.

The production of the auto-trucks is a simple matter from an engineering point of view; 2,500 of these wagons per month has been mentioned as a probable output, and it would not be impossible, with plenty of money, to reach that figure by August 1, 1899, although neither of the plants owned by International Air Power Company are now equipped with machinery specially adapted to the production of the auto-truck. But Worcester and Providence and vicinity can turn out unlimited supplies of machine work of the highest class to any financially sound order, and the production of the auto-truck can be very rapidly brought up to any possible demand.

#### Rapid Advance of Stock.

In regard to the financial outlook for New York Auto-Truck Company, it may be said that the stock was listed at 9 in September, 1898, and was sold at 48½ on January 14, 1899, the day on which the present organization was completed; at 62 on January 16; at 68 on January 17, and on January 18 at 71.

HUGH DOLNAR.

New York, January 19, 1898.

#### Motor Wagons for Ice Delivery.

The Consolidated Ice Company of New York city is considering the advisability of using motor driven wagons for the delivery of ice. According to reports the company will order 1,000 wagons, provided a satisfactory vehicle can be found. Plans and estimates have been invited for these wagons. The routes traveled by the company's regular wagons average, at present, from ten to fifteen miles in the city, and from twenty to twenty-five miles in the suburbs. These wagons weigh when empty about 3,500 pounds and have a capacity of from six to eight tons. Owing to the nature of the load the form of motor used in the new wagons must be free from heat and of small size, besides being powerful and cheap in first cost and cost of operation.

#### Low Price on Old Pope Models.

The Pope Mfg. Co., having on hand a limited number of its early product of chainless machines, has, by reason of recent improvements, decided to place the old stock on the market at \$65, and so announced at the opening of the New York show. The object of the company is probably to emphasize the value of the latest improvements and place the new machines where they belong, in undisputed possession of the position at the head of its models.

#### Paris Cab Company Delayed.

The General Automobile Company of Paris has had much difficulty in securing from England the accumulators ordered for use in its electric cabs which were to be put in public service in the French capital January 15. It is now announced, however, that 100 vehicles will be put in operation about February 15 and will have a maximum speed of thirty-five miles an hour.

Considerable interest has been aroused in France by the offer of a Frenchman to convert into alcohol driven vehicles the first ten petroleum motor vehicles sent to him, and it is expected that a contest between alcohol motor vehicles will take place early in October.

# INFORMATION FOR BUYERS

## ESMOND BICYCLE STANDS.

E. R. Esmond, 227 W. 29th street, New York city, is making a complete line of cycle stands which includes supports for home, store, office and exhibition purposes. The stands are all very rigidly constructed, and are finished in enamel, nickel, bronze or brass or combinations of these. One pattern of wall bracket and one floor stand are fitted with automatic locks. Of the two self-supporting floor stands illustrated the one at the left has an enameled base and nick-

eled rods. The other is a small, neat stand for use in the home. Legs are also furnished by the company so that a board of any length can be secured thereto and any number of the wall racks attached, thus giving a series of holders for street, store or club room use. The exhibition stands are adjustable in length from 38 to 44 inches for single bicycles and from 62 to 68 inches for tandems. A stand constructed similar to the exhibition stand and having a trough running its entire length, directly under the bicycle, is convenient for cycle cleaning purposes.

## THE "PERPETUAL" SEPARABLE PEDAL.

Edmonds & Metzger, 115 Monroe street, Chicago, have begun the manufacture of the Perpetual pedal, the distinguishing feature of which is that the bearing parts may be separated, cleaned and replaced without removing the balls from their races and without disturbing the adjustment. The first 1,000 lot of these pedals has been finished and the company is now ready to deliver goods. An exhibit was made at the recent Chicago cycle show where several large orders were placed for the pedals. As will be noticed from the accompanying drawings the pedal barrel instead of being brazed or otherwise permanently secured to the frame, is exteriorly screw threaded at its base and screws into the threaded hub on the inner cross arm of the frame. The outer end of the barrel enters snugly a cap-shaped sleeve on the outer frame arm. A rigid connection between the frame and barrel is thus form-

ed when the two have been screwed together. This feature of the construction as well as certain others is patented. To separate the bearing parts it is merely necessary to unscrew the barrel from the frame and then turn off the outer bearing cone from the end of the spindle. The outer row of balls is retained on the cone and the inner row is held on the spindle race by ring retainers. In the end of the cone is a small set screw against which abuts the end of the spindle when the cone is screwed down

tight upon it and by screwing the set screw inwardly or outwardly the adjustment is loosened or tightened. The threading on the adjusting set screw is in the opposite direction from that on the cone so that there is no tendency for the adjustment to become accidentally altered while the pedal is in use.

## FRONTENAC MODELS AND CONSTRUCTION.

The advance circular of the Frontenac Mfg. Co. of Syracuse, N. Y., illustrates and briefly describes five models of Frontenac bicycles. The regular road patterns for men and women, Models A and C, and the women's diamond frame machine, Model G, sell at \$50; the track racer, Model B, at \$65, and the 30-inch wheel machine, Model E, at \$60. All models are fitted with Victor tires and enameled in the company's special russet color. The steering heads are enameled black. Frontenac Brown pattern saddles and Watson seat posts are the regular equipment for those parts. The Frontenac specially constructed flush joints and the double tubular fork crown continue to be mechanical features of the machines. Any of the models will be fitted with Weston rear hub brakes if desired.

## FLOOR WHEEL TRUING STAND.

To meet the universal demand for a good and substantial floor wheel truing stand the New England Cycle Supply Co., of Keene, N. H., are offering the tool herewith illustrated. It is handsomely designed, very strong and stiff, and is well made. It

will take the wheel either with or without axle. The gauge is simple, durable and quick in its adjustment. The swing shelf is a convenience. The weight of this stand is 40 pounds, boxed. The price is about the same as that usually asked for bench truing stands. This new stand, together with other specialties, will be exhibited in spaces 42 and 43 at the New York show.

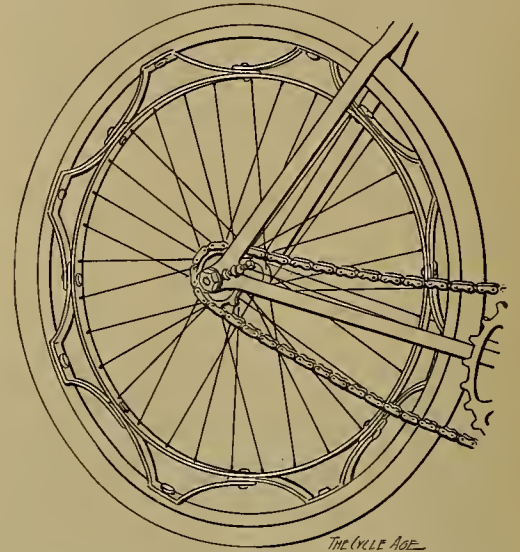

## THE CROWN BICYCLE HUBS.

For the third year the Cortland Carriage Goods Co. of Cortland, N. Y., offers as a high grade type of light weight cycle hub its Crown tempered barrel hub. This is carefully designed on standard lines with view to producing as simple and reliable and at the same time as free running a hub as possible. The front hub has a one-inch barrel and the rear hub 1 1/4. The axles and nuts are hardened and the rear wheel sprocket is screwed into the barrel with a right hand thread and locked by a left threaded nut. The regular chain line is 1 3/8-inch, though any chain line desired will be furnished. Spoke flanges are regularly drilled 32 and 36, other drillings being optional. The cups and cones after hardening are ground, polished and burnished and present a very highly finished appearance as well as being accurate in size and true in angles of race surfaces. The company also makes forged steel cranks and other bicycle drop forgings.

## RESILIENCE OF WOOD RIMS INCREASED.

A new "non-puncturable bicycle," and a Philadelphia product in its entirety, is "The Luxury," manufactured by the Devine

Wheel Manufacturing company—P. F. Jann, president; C. E. Stump, secretary and treasurer—incorporated with a capital of \$100,000. The feature of the new machine is the discarding of the pneumatic tire and the use of a special cushion tire, the necessary resiliency being obtained by means of a series of eight convex springs connecting the rim with an inner wheel to all intents and purposes the counterpart of the wheel at pres-

ent in use on the majority of bicycles except that it is, of course, smaller and has a flat steel rim, which at the points of contact with the eight convex springs is fastened with small bolts and nuts. George H. Foley, 911 Walnut street, Philadelphia, formerly representing the Remington company in Philadelphia, is distributing agent for the new bicycle, of which 200 have already been turned out.

## READING STANDARD COMPANY ELECTION.

At the annual meeting of the Reading Standard Mfg. Co. of Reading, Pa., the stockholders re-elected the old board of directors, with the following officers: Johnathan G. Leinbach, president; Thomas P. Merritt, treasurer; William F. Remppis, secretary and general manager.

The Reading Standard company has done a largely increased and satisfactory business during the past year and the reports for the coming season are excellent. The company's former agents all report that they expect to sell far more Reading Standards this year than last and new agents are being added to the list daily. The company has a fine line of 28-inch wheels listing at \$30, \$40 and \$50, as well as a 30-inch model, listing at \$45, and the Reading Standard roller gear chainless model, listing at \$75.

A number of improvements have been made in the well-equipped factory, which is busily engaged on the season's product, so as to be ready to supply the wants of agents promptly when the shipping time arrives.

## ROOMY FRAME FOR WOMEN RIDERS.

The accompanying illustration shows a frame for women's bicycles, which has been designed by Sylvester B. Hill, 282 Front

street Chicopee, Mass. A military bicycle was recently constructed by the same designer and was illustrated in the Cycle Age of December 2, 1898.

## SAGER GEAR AND SADDLE INTERESTS UNITE.

An amalgamation of the Sager gear and saddle companies has been effected. The change was made because the owners of the two being largely the same people, it was considered undesirable to continue the expense of separate forces. Both companies

drew on the same sources of supply, so that the change is in every way beneficial. The capital of the Sager Gear Co. has been increased to \$400,000.

#### IMPROVED TIRE INFLATOR.

The penny-in-the-slot tire inflating machine shown in the accompanying illustration has been added to the line carried by the Beckley-Ralston company of Chicago. It was designed by L. S. Brown, formerly of Columbus, O., and one of the machines which was placed at the disposal of riders in a public

park of that city for three months netted during this period an income in pennies of \$45.50. A large number of hardware dealers in Ohio, who also carry bicycles, have given orders for the machine, believing that it will save them the constant annoyance of complying with request for inflation of tires in the store, while at the same time bringing customers to their doors. By the possession of the inflating machine the loss of time is turned into a gain of pennies which quickly repays the first cost of the machine. It is stated that the internal mechanism of the slot arrangement is proof against tampering and will not get out of order.

#### WHY BUESCHER CO. DOES NOT EXHIBIT.

The Buescher Mfg. Co. of Elkhart, Ind., makers of pumps, toe clips, spring seat posts and other cycle specialties, states that it does not exhibit at cycle shows because its products are in the hands of representative jobbers throughout the country. The company would come in contact with some jobbers at the shows who might be interested in its goods, but would at the same time meet many more retailers, and it is the aim of the firm to have the jobbers handle the retail trade. For these reasons the company avoids cycle shows and gives the jobbers full opportunity.

#### LIGHT SELF-CLEANING CHAIN.

In the accompanying illustration is shown a bicycle chain, invented by August C. Schaefer, 76 West Congress street, St. Paul, Minn. The aim of the inventor has been to produce a chain much lighter than the ordinary without reducing strength or wearing surface and especially a chain for which no gear case will be required and which for this reason should be very acceptable in all countries, America included, where the favorable climate reduces the necessity of a gear case to such a point that the constant attachment of one is felt as an incumbrance. Mechanically, the main feature is the little lateral lug observed on each end of links and extending into the adjacent link. This lug forms a bearing the full length of journal on crosspin, and insures central draft on the entire chain. Without this lug the chain would be worthless, as each link would then draw the journal on either side in opposite directions, lengthen the chain and run uneven. A line of uniform thickness is thus formed by the links, having no bridges or splices, by which mud may be carried on to sprockets. On both ends of each journal pin rollers are secured by riveting. Where the chain is separated one of the rollers is secured by a removable lock-

ing plate as shown at one of the links in the illustration. The curved grooves cast on the face of the rollers serve a double purpose. In connection with the convex edges of the sprockets the grooved roller will produce a bearing equal in durability to a flat bearing

of one and one-half times its width. The grooves also prevent the link from touching the sprocket at any place. The inventor also claims that the rollers, being fastened upon pins, will aid in bending links when entering into small sprocket, the point where most power is usually wasted in propelling. Riders who have tried the chain contend that mud has no effect on the chain in running. Special sprocket wheels are of course made for this chain and may be made light and yet rigid with the large sizes now generally preferred. The inventor is looking for an opportunity to manufacture on a satisfactory scale.

#### "O. K." BICYCLES WELL CATALOGUED.

The Otto Konigslow Cycle Mfg. Co., 45 Michigan street, Cleveland, has issued a descriptive catalogue of its cycle models which, besides being unique and attractive from an artistic standpoint, specifies the fittings, equipments and main points of construction of the patterns illustrated in a manner both novel and convenient for the reader. Facing the page illustration of a model appear the corresponding specifications arranged in tabular form allowing the reader to readily determine what the regular equipment is in every particular and also what if any are the options offered. The leader of the Konigslow line is the O. K. Model 20, which has a 30-inch rear wheel and 28-inch front wheel. Model 21 is a lady's pattern to match. These two patterns sell at \$50. Of the three the \$40 patterns, Models 22 and 23, are respectively men's and women's roadsters with 28-inch wheels, while Model 24 is a man's machine with both front and rear wheels 30 inches in diameter.

All patterns are offered with either square or oval forged front fork crowns and all have flush joints made by swaging the tube ends and placing them inside of regular outside connections which have the same diameter as the unwaged portion of the tube. Black is the regular color, with terra cotta and coach green as options. The hangers are of one-piece crank and axle construction, and the Duckworth chain is used. Butler &

Ward saddles are regularly supplied. The tire equipment includes Hartford, Morgan & Wright, Goodrich and Palmer tires. Kundtz laminated rims are used on the \$50 patterns, while the \$40 machines are supplied with Old's one-piece rims, striped. The company calls especial attention to the fact that outside of such equipping parts as tires, saddles, pedals, etc., every part of the O. K. bicycles is made in the Konigslow factory. The company also makes a cheaper bicycle, called the Weld, which retails at \$30.

#### THE LATTA TWO-PIECE HANGER.

The accompanying illustration shows the construction of the Latta two-piece hanger which was described in the last issue of Cycle Age and which is manufactured by

the Straight Mfg. Co. of Jamestown, N. Y. The hanger is supplied to the trade by the Geo. L. Thompson Mfg. Co. of Chicago.

#### SNOW STANDS JOBBED IN THE WEST.

For the benefit of western buyers the Snow Wire Works, of Rochester, state that their bicycle stands, which have been de-

#### INDIANA BICYCLE CO.'S ELECTRIC STANHOPE.

It is the intention of the Indiana Bicycle Co. of Indianapolis, to devote just as much of its factory to the construction of electric vehicles as the business will stand, to turn out the best and handsomest vehicles that it is capable of making in a variety of styles, and to sell them at a price that will not invite competition either now or at any time in the future. In the accompanying illustration is shown the company's Waverley Stanhope which is a very rich, elegant vehicle of the ordinary electric type, weighing about 1325 lbs. and propelled by a motor of the company's own design and construction, the armature shaft of which is geared directly to the hubs of the rear wheels by a single reduction. The frame of the running gear is tubular; the wheels are wire with direct tangent spokes, steel rims, 2 1/2-inch pneumatic front tires, and 3-inch pneumatic rear tires. It has five speeds varying from about three to fourteen miles per hour and its selling price is \$1200.00.

scribed in Cycle Age, will be carried in stock at Chicago by the Beckley-Ralston Co., the Excelsior Supply Co. and Eugene Arnstein, and that orders for the stands placed with any of these firms will receive careful and prompt attention.

**MANY ARIEL PATTERNS.**

The line of Ariel cycles made by the Ariel Cycle Mfg. Co. of Goshen, Ind., and which

Model 50—30-inch wheels. Price, \$65.

Model 51—Track racer. Price, \$60.

Model 58—Sager chainless. Price, \$75.

Model 52—Men's roadster. Price, \$50.

Model 53 - Ladies' roadster. Price, \$50.

Model 54—Men's roadster. Price, \$40.

Model 55—Ladies' roadster. Price, \$50.

is herewith illustrated, comprises patterns of characteristic tasty and clean cut design. With the exception of the \$40 models the

machines all have the tubular Ariel fork crown, massive in effect yet light in weight. The hanger is of special two-piece construction and is secured by a bolt the head of which comes flush with the outline of the left crank and leaves the exterior appearance of

Model 56—Double Diamond Tandem. Price, \$75.

Model 57—Combination Tandem. Price, \$85.

both cranks alike at the axle ends. All machines have flush joints and the handle and seat post clamps are operated by spanners and are devoid of unsightly nuts. The chainless pattern is made in both men's and women's models and is equipped with the Sager roller gear. Ariel saddles of the Brown pattern and Wheeler saddles compose the regular saddle equipment and the pedals used are the Record and Banner. All machines are fitted with Lefever chains. Mod-

Ariel handle bars.

els 50, 51, 52 and 53 and the tandems are enameled in Brewster green; Models 54 and 55 in Ariel maroon and the chainless patterns in either maroon or green. The combination tandem represents the latter day idea in tandem construction of placing the drop frame for the lady in the rear and constructing the machine as a single steerer. The frame is well braced and presents an attractive appearance.

**STRAUSS SECURES SOUTHERN ORDERS.**

Matthew Strauss, 334 Genesee street, Buffalo, who is jobber and selling agent of several large lines of cycle parts, sundries and fittings, reports an excellent business even this early in the season and that many good orders have been booked from southern dealers and repairmen.

In the report of the Chicago cycle show a typographical error crept into the table of models manufactured by the Pope Mfg. Co., Hartford, Conn., and made the list price of the men's Hartford, Model \$19, appear as \$36. The correct price of this machine is \$35.

The Demorest Manufacturing company of Williamsport, Pa., is running to its full capacity on bicycles and sewing machines. It has lately built up an important export trade, and report orders for more than 12,000 bicycles for foreign buyers.

R. B. McMullen & Co. of Chicago are introducing a new saddle made by the Hunt Mfg. Co., known as models 76 and 77. It is of the padded type, with nose of the Brown style. It has already been sold extensively to jobbers.

Edward Porter, known the country over as an exponent of Palmer tires, has lately changed his position, joining the W. R. Rollins Mfg. Co. of Chicago.

# THE PASTIME AND SPORT

## WILL OPPOSE CYCLE TAX

Washington Wheelmen Will Present Objections to Proposed Legislation.

Washington, Jan. 23.—The wheelmen of this city are strenuously opposing the proposition of the municipal authorities to have Congress enact a law imposing a tax on all bicycles in the District of Columbia. They contend that this proposition is nothing more than a deliberate attempt to fine every person for riding a bicycle, inasmuch as a tax could not be urged as a revenue measure. The proposed law also provides for the registration of all bicycles. The wheelmen point out that this provision would be of no practical value, as every bicycle now sold is numbered in such a manner that it can be easily identified. President Potter has assured the officers of the local division of the L. A. W. that the League would support every effort of the local division made against the imposition of a bicycle tax.

At an early day a committee representing the wheelmen will appear before the two congressional committees having the tax measure in charge and present their objections to the passage of the bill. If their efforts are unavailing and the bill is finally enacted, then the wheelmen will strongly urge that the tax levied be expended in the improvement of the country roads around the city.

At a recent meeting of the local division of the L. A. W., the chief consul was empowered to appoint a committee to appear before the District commissioners and urge the repeal of the handle-bar regulation, which is practically a dead letter upon the police regulations and inoperative.

## Philadelphia Wheelmen Awake.

Philadelphia, Jan. 23.—Some results of the recent activity of the A. C. C. of Philadelphia were made manifest last week by the passage by the city council of a bill declaring the throwing of glass on public highways to be a nuisance and providing a \$10 fine for every offense; an appropriation of \$1,500 for asphalt strips on Broad street over the Reading railway "hump," the laying of two-foot vitrified brick gutters along both sides of a greater portion of the East River drive in Fairmount park, which, although slightly concave, make excellent side paths; the appropriation of \$10,000 for the completion of the brick cycle path along the Mount Prospect drive in West park, and the repaving of the whole system of drives between the Oxford and Dauphin street entrances to the park. The association is now stronger than ever, thirty-one of the largest clubs being members, representing upwards of 5,000 wheelmen.

## Cycle Path Bill in New York.

A bill has been introduced in the New York state senate which has the sanction of the L. A. W., and which, if passed, will have a great effect in strengthening the movement for cycle side paths in that state. According to the bill, any county judge, except in Monroe and Albany counties, may, upon the petition of fifty resident cyclists, appoint five wheelmen as a board of side path commissioners, their term of office to be five years. The board will be authorized to construct and maintain side paths along any of the public roads of the county. The paths are to be not less than three feet wide and not

more than six. A further duty of the board is to settle upon a license fee of not less than 50 cents and not more than \$1, and no cyclist will be allowed to use the paths unless he holds such a license. The fees when collected will be deposited with the country treasurer and will be used for building and maintaining the paths.

## Outlaw Riders Remain Obstinate.

The members of the American Racing Cyclists' Union claim that as soon as the complete welding of its interests with those of the track owners is completed, the League will be spared the bother of deciding whether or no it shall continue the control of racing. Arthur Gardiner, who is vice-president of the A. R. C. U. and who, in the absence of President E. C. Bald, is general manager of and chief talker for the Union, is now in the east trying to bring about the last step in the separation of the riders from the League. The racing men en route for San Francisco are said to have been polled upon the subject of smoking the peace pipe with the L. A. W. and to have unanimously declared in favor of a special racing organization, the ground taken being that it would be impossible to induce the League to carry out all of the reforms demanded by the racing men.

## Fast Racing in Algiers.

The final of the Algerian championship was run at Algeria on January 8. The semi-final heats of 1,000 meters were won by Banker, Grogna, Guignard and Tommaselli. In the bell lap of the final Grogna and Banker tried to jump, but Tommaselli followed and forced them to the outside of the track during the entire last lap and won the race, riding the last lap in :22 1-5, constituting a competition record for a fifth of a mile. Banker ran second by half a length and Guignard third. Banker won the 1,080-meter handicap in the record time of 1:20 1-5 from scratch. Grogna running second, St. Ives third. The 2,000-meter tandem race was won by Banker and Tommaselli from Gaub and St. Ives, second, and Grogna and Coquelle, third.

## Nine Inch Cranks in England.

Long cranks and high gears form the subject of a discussion which rages in the English cycle trade at the present moment. There are some who look upon nine-inch cranks and a gear of 90 as the proper combination for experienced riders—others are more moderate in their views. The opponents of these frown upon the attempt to displace the six and a half-inch crank and a gear in the neighborhood of 60, which has been the popular one with the masses.

## Brooklyn Riders Plan Asphalt Strips.

The Associated Cycling Clubs of Brooklyn have undertaken the attempt to have asphalted connections made with all the principal cycling routes in the borough. They mean to unite all the important asphalt street and will ask the local boards of all the districts to come together in the near future and petition the Board of Public Improvements to urge their request on Mayor Van Wyck.

Philadelphia will spend \$2,000,000 this year on the improvement of the city streets.

## CYCLISTS' ROAD RIGHTS.

Kansas Judge Decides That Bicycle Riders Are Not Responsible for Runaway Accidents.

Topeka, Jan. 22.—Judge Simpson, of McPherson, Kan., has rendered a decision of importance to wheelmen in the case of George Lehman against Henry Kibbe. He holds that a bicycle rider is not responsible for accidents which may result from horses becoming frightened at persons riding bicycles, because all persons who travel on public highways have a right to choose the vehicle or conveyance they desire to use. This decision at once places every wheelman in Kansas on an equality with the drivers of horses, the important point being that wheelmen are not expected to leave their machines by the roadside and walk ahead to ask a man if his horses will be scared.

The decision of Judge Simpson clears the atmosphere of many theories which the people who do not ride bicycles have held, and furnishes a basis upon which an organized effort in the direction of procuring wheelmen's rights may be based.

Henry Kibbe, of Hutchinson, was riding his machine along the public highway, when George Lehman met him. The latter was driving a team, which became frightened, ran away, and threw Lehman out, crushing his leg. He sued Kibbe for damages, including doctor's bill and the injuries to the team and damage to the buggy in which he was driving. He lost the suit, Judge Simpson's decision being in part as follows:

A person wishing to travel in the public highway in this state has the legal right to choose any kind of vehicle he pleases and every person who wishes to do so may ride a bicycle along the highways of this state with the same rights he would have with any other mode of conveyance, and is subject to the laws of the road the same as the driver of any other vehicle.

Persons traveling upon a highway are required to use ordinary care and prudence and are not liable for injuries to others unless they are guilty of some wrong or want of ordinary care which is the direct or proximate cause of the injuries.

A person riding his bicycle on a public highway has the right under the law to presume that horses of ordinary gentleness have become so familiar with bicycles as not to scare at them and as to be safe under careful guidance and would not be required to stop and inquire whether the horses are likely to be frightened in order to anticipate that such horses would be frightened.

## Good Roads Day at the Assembly.

Special arrangements are being made to make good roads day at the coming National Assembly of the L. A. W. at Providence more interesting and profitable than the day has usually been at previous assemblies. At the two sessions there will be representative speakers to present new and advanced ideas on the improvement of highways as affecting horse owners, automobilists, farmers, and cyclists, and also upon such subjects as state aid and scientific road building.

## Sams Denies Telegram Story.

Conway W. Sams denies that his withdrawal from the League presidential contest was because of a telegram sent to a doubtful district which sent back an answer in favor of Keenan. Sams say that the story is mythical and that during his conference with Keenan nothing was said about the respective strength of the two candidates, that everything was friendly, and that all there was to the withdrawal was his own statement that there would

be no contest for League offices this year so far as he was concerned.

#### Relic of Cycle Boom in Porto Rico.

Some years ago a German bicycle firm sent a representative to San Juan, Porto Rico, and created much excitement in a sporting way, organizing an athletic club, selling several hundred bicycles, and engineering the construction of a \$10,000 bicycle track. It is a one-fourth-of-a-mile affair, the record of which is 32 seconds. The war broke up the club and its property has been turned over to the American club.

#### NEWS IN BRIEF.

Tom Linton is now in Germany, where he will ride during the greater part of this year, having signed a good contract.

"Mother" Webb, Cooper's trainer for the last three years, will have charge of the Columbia college team this year.

F. W. Chinn, the Englishman, has emulated the example of Bald and Titus by retiring from racing and adopting the stage.

At the meeting of the wheelmen's national union in Switzerland on December 10 the treasurer's report showed a deficit of \$155.

The trial of Peter Berlo's new gasoline motor pacing tandem is being delayed until the arrival of some special tires now being made for the machine.

By riding in exhibition at Madison Square Garden on January 4, Arthur Zimmerman became a candidate for suspension by the L. A. W. racing board.

Joe Downey, the boy wonder, left for Boston after his races in New York just in time to escape arrest by the Gerry society for performing in public under fifteen years of age.

The Supreme Court of Iowa declares that while no law requires bicyclists to use lanterns or bells at night, wheelmen without them are guilty of contributory negligence in case of accident.

The new Great Central hotel in London is to have a small cycle track on one of the upper floors. The purpose of the track is to allow the guests to take their usual cycling exercise regardless of the season or weather.

The wheelmen of Manistique, Mich., are heartily in favor of securing legislation looking to the protection of bicycle paths in their state, owing to the fact that farmers cannot resist the temptation to use them for cow paths.

The newly formed Bengal Cycling Association is doing all in its power to bring about a flourishing cycle racing game in India and is taking the necessary steps toward the building of a cycle track in the neighborhood of Calcutta.

The Grand Prize race of Paris promises this year to be unusually interesting since the prize will be larger than ever before, \$2,000 having been voted for the purpose by the municipal council of Paris and \$400 by the department of the Seine.

One of the first consequences of the application of the Denver Wheel Club for admission to the L. A. W. was the delegating of the club's president as a representative to the National Assembly inviting the League to hold the 1900 meet in Denver.

Eddie Bald, who was the first of the racing men to arrive in San Francisco for the indoor races there, has been telling the local newspaper men of that city about his expected conquests on the other side of the Atlantic next summer and that he expects to do his preliminary training in California.

Harry Elkes is said to be responsible for a novel and valuable idea in training for paced races. At unexpected times his pacers slow up as if they had met with an accident and Elkes rides ahead and goes unpaced until picked up by a relieving team. In this way he becomes used to accidents and to sprinting unpaced without slowing up.

Illinois good roads advocates are preparing for an early start in the campaign at the state legislature for better roads in the state. Judge Gibbons and Assistant Corporation Counsel W. H. Arthur, of Chicago, are framing a bill and wheelmen of Chicago are raising money with which to push it after its introduction to the legislature. The bill will be much like the New Jersey good

roads bill which provides that each county which builds good roads will receive a bonus from the state for so doing. In order to make the good roads bill stronger the proposed bicycles-as-baggage bill has been abandoned.

The Wisconsin division of the L. A. W. will ask the present session of the state legislature to repeal the statute passed last summer giving the cities power to regulate and license bicycle riding, which not only imposes an extra burden on cyclists, but makes them liable to arrest and annoyance while touring.

Earl Peabody is so determined to once more wear the virtuous halo of a simon pure that he declares he will bring suit against the present chairman of the racing board if not reinstated. Peabody's father is deeply interested in the matter and will back the ex-amateur speed merchant in his efforts to force the racing board to reverse its decision.

A bill to tax bicycles, which has been introduced in the New Hampshire legislature, is very simple in its provisions, calling for a tax of \$1 apiece on bicycles, the entire proceeds to be devoted to the improvement of highways. The wheelmen of the state generally seem to agree that some such a measure should be passed, or, at least, should not be opposed.

One of the features of the indoor racing to be held out on the coast will be another trial of Henri Fournier's motor pacing machine. Fournier is not entirely discouraged by the failure of his machine at New York and will take advantage of the privilege granted him to place his motorcycle among the pacing machines in a hundred mile race at San Francisco.

Major Taylor denies the press reports which stated that he was endeavoring to secure teams of colored pacemakers because his white pacemakers had not done their best for him. He says that the teams he rode behind at Philadelphia strained every nerve to give him all the pace he wanted and that he has not the slightest complaint to make of their willingness.

Assemblyman Collins has introduced a bill against six-day racing in the New York legislature which makes it a misdemeanor for any contestant in a bicycle race or other contest of skill or endurance to continue in such contest after the expiration of forty-eight hours for a longer time than twelve hours out of each twenty-four. Any manager permitting such violation is also guilty.

London cyclists are now rejoicing in the fact that drivers of carriages, coal wagons, omnibuses, garbage carts, etc., must carry lights after dark as well as themselves. Universal lighting of vehicles is an accomplished fact within the entire district under the jurisdiction of the London county council. While the police are somewhat lax in some neighborhoods the number of vehicle drivers who are being brought into court for not carrying lights show that the new law is not to be a dead letter for some time at least.

## AND TRADE REVIEW

VOL. XXII—No. 14.

CHICAGO, FEBRUARY 2, 1899.

NEW SERIES No. 63.

### AMERICAN PARTS IN SWEDEN OUR SADDLES ARE NOT LIKED

Two Concerns Announce Their Intention to Handle Only Parts Which Are Made in This Country.

Soderhamn, Sweden, Jan. 12.—On the first day of this year the new tariff law went into effect and the custom duty on bicycles will be \$7.50 on each complete bicycle and 54 cents a kilogram on parts, but this new custom duty is not likely to hurt the American trade in this country for many years to come. It has been stated in a former letter that this country would have to import about 75 per cent of all bicycles sold annually, and this estimate is now found upon study of reigning conditions to hold good for this year.

#### Big Opportunity for Parts Makers.

The following articles must, without exception, be imported, as there is no concern making such parts yet: Pedals, saddles, chains, spokes, hubs, crank hangers, rims, frame connections, handle bars, seat posts, chain adjusters, fork sides and fork crowns, and several minor parts.

Pedals have up to date been imported from Germany and England, with a few from the United States. Saddles have mostly come from Germany. American saddles are not liked very much, but by conforming to the wants of this country America could get a good share of the trade. Saddles of the Brooks pattern are the most liked. The better quality chains have come from England and the poorer from Germany. Hubs have mostly come from England, also frame connections.

#### Superiority of American Parts.

Until last year there were few American parts sold, but in that year a considerable quantity was sold, and this year promises to be still better. Two concerns are known that will use American parts exclusively. That American parts are considered superior can be illustrated by a firm which charges \$20 more for every cycle manufactured from American fittings than for those manufactured from German or English parts, although the American parts did not cost any more, besides being easier to put together and superior in finish. So it may be seen that here is an excellent chance for parts makers to sell their products. But it is suggested that they be not too slow in getting their goods marketed here, as ten years hence nearly all parts mentioned above will be manufactured here; for such has been the case with railway locomotives, which until ten years ago were all imported from England, but now we have two very large works building very fine locomotives, and only a very few are imported.

Until five years ago mowers, hay racks, self-binders and other agricultural machinery were all imported from America, but now we have several factories making these articles, but not on as large a scale as to supply the demand. Lathes and milling machines have formerly been imported from Germany and England, but three enterprising concerns bought some engine lathes from America, used them as samples, and are now making lathes exactly like them and on a large scale, and are finding a ready market for them. A great many more cases similar to this could be brought forward, but this may be enough to show that it is better not to wait too long in getting their goods represented here. It is best to strike while the iron is hot.

#### Exclusive Agency Not Recommended.

A branch house would be the best thing if managed by a man with American push and energy. Exclusive agencies are not to be recommended, as such concerns in this country usually rely mostly on the fact that nobody else sells the same goods, and therefore sits down, waiting for business to come—and it generally does come. But a larger volume of business would be done would they go at it with American energy.

#### To Help Dealers in Georgia.

Bicycle makers are being solicited to contribute to a campaign fund which will be expended with the intention of defeating the bill now in the Georgia legislature which provides for a \$200 penalty on every company selling or dealing in bicycles, by itself or its agents, in that state, which does not pay a tax of \$5 per annum for each agent so represented. The measure is but another variation of the many laws discriminating against non-resident corporations. It is possible, if the tax is not paid, to prevent outside corporations from doing business within the state—even to confiscate the stock of dealers representing outside firms. Hence H. A. Lozier, Sr., has called the makers to his support, and from many of them received promises of aid in opposing the passage of the bill.

### SADDLE MAKERS CONSOLIDATE TWO MILLIONS CAPITAL STOCK

Headquarters of the Organization Will be in Cleveland—Saddle Patterns to be Decreased.

Under the title of the American Saddle Company, with a capital stock of \$2,000,000, many saddle makers have effected a consolidation. One-half of the capital will be issued as preferred shares and the remainder as common. The headquarters of the organization will be in Cleveland, O. The officials of the concern will be elected within a week. The stock is being distributed upon a basis of inventory valuation of the plant, stock, fixtures and business of each firm. The organization was made effective, so far as commercial interest is concerned, on January 1 of the present year.

#### Reasons for the Organization.

Of course there is a reason for an organization of such a colossal character. It is found chiefly in the fact that while for two or three years past the price of saddles of all kinds has been steadily declining, the bulk of sales have been made in the cheaper forms of manufacture at prices which have not proved profitable. While at present it is difficult to persuade bicycle manufacturers, who at the present moment are the heaviest buyers of saddles in advance of the season when they are actually put to use, that there will be benefits conferred upon them by the formation of the American Saddle Company, yet this is the broad foundation of the organization. The reasoning for this conclusion is as follows:

#### Saddle Options Will be Lessened.

Months in advance of the actual use of saddles the bicycle manufacturing establishments are persistently solicited by the representatives of saddle making houses to stock up with the variety of patterns manufactured. If the American Saddle Company is successful in its outlined plan of operations, hereafter the concerns within it will assure bicycle makers that to each establishment within the organization will be apportioned the duty of making only a few patterns of recognized advantage in use. Moreover, it is the intention to give the bicycle makers the benefit of such curtailment of selling expenses as the withdrawal of the foregoing form of competitive strife has engendered.

Within the last year it has been an open question among the saddle makers as to whether the makers of cheap goods would destroy the business of the makers of high priced stock, which afforded some profit, or would annihilate the business of both.

## BRAZING BY IMMERSION

### Brass Founders' Crucible Used in Circular Furnace—Removal of Spelter By Puddling

While the majority of manufacturers who find immersion brazing practicable have made their furnaces of the type which takes the trough-shaped crucible, at least one firm is using successfully a furnace in which the brass is melted in an ordinary brass founder's round crucible. The furnace is now in operation in the shop of B. E. Harris of Chicago, and was erected after plans furnished by the Welland-Vale Co. of St. Catharines, Canada.

#### Construction of the Furnace.

The fire brick structure is circular in shape, as may be seen from the illustrations, and stands about forty inches high. A central shaft in the neighborhood of 17 inches in diameter extends from the top to the bottom and in this shaft are supported the fire grates and the crucible. The grates are of common furnace grate pattern and are some distance above the floor, leaving ample room for the accumulation of ashes and clinkers. The latter may be removed from the furnace through an opening in the wall near the floor. This opening is closed by a thin plate of iron which is arranged to slide upward between metal ways secured to the sheet metal casing placed around the fire brick walls of the furnace.

The casing is merely thick enough to aid in keeping the fire brick in shape

PUDDLING OUT SPELTER FROM CRUCIBLE.

WELLAND-VALE FURNACE IN OPERATION.

and gives the furnace a neater appearance than it would possess uncovered.

The support of the crucible is one of the strong points of the furnace, being designed to absolutely prevent the crucible from collapsing and falling into the fire by the weight of the metal carried, or cracking from too rigid encasing and propping. Three buttresses with faces curved to correspond to the curvature of the sides of the crucible are projected from the inner wall of the furnace, forming a sort of basket seat into which the crucible may be placed. The

support by this plan comes on the sides of the crucible from top to bottom and makes unnecessary props under the bottom of the crucible.

The heat and flame rushes up around the sides of the crucible in the same manner as in other crucible furnaces previously described and are deflected to pass across the top of the spelter by cover tiles, also as previously described. One of the inner walls of the furnace is built with a vertical recess or chute and through this space coal is fed to the fire. When not needed the top of the opening is closed with tile. The draft pipe enters the furnace below the grate in the usual fashion.

#### Advantages of Round Crucible

The round crucible, while it does not offer the convenience for brazing certain parts that the trough-shaped crucible affords, yet gives ample room for dipping all of the joints of the ordinary single frame, and has the obvious advantage that the spelter will not be affected by exterior cold draughts as much as when held in a shallow crucible. While a little more time is spent in firing up than with furnaces which give readier access to the fire box, little attention is, on the other hand, paid to the fire during the day, and it is stated that two bushels of coal will last for a ten hours' run, making the coal expense not over fifty or sixty cents per day. While the furnace has not been put into constant operation as yet, from 80 to 100 complete frames have been brazed in one day. The operator states that but little if any over five pounds of brass were used for 100 frames. The round crucible is claimed to last under constant use from ten days to two weeks, but the crucible specially referred to in this article has given much better service than that. Allowing \$3 per day for the wages of a good man and counting in the various other expenses, the cost of brazing frames should not run much higher than \$4.50 per hundred, or 4½ cents apiece.

At night when the day's operations are over the blast is shut off and before the brass solidifies about half of it is pud-

dled out on the ends of stout iron bars, one of which, about half loaded, is shown in one of the illustrations. The rest of the brass is left in the crucible, but before it cools a rear fork, fitted to its stay, is placed in the crucible with the point of the V in the brass. In the morning the brass will have solidified and the entire button, weighing perhaps fifty pounds, may be lifted out by means of the projecting stay and fork. Before the melting is begun the button is lifted a short distance from the bottom and some loose spelter thrown in underneath it. This leaves room for expansion between the button and wall of the crucible and prevents injury to the latter. After the brass already in the crucible has been melted the rods with the puddled out brass on their ends are stuck into the crucible and their loads melted off.

### CONSTANT DIP BRAZING WORK

**Discomfort from Heat No Greater Than By Blowpipe Method—Parts Dipped Cold.**

To the Editor:—Having read with interest the description of the "Fulton" brazing furnace in your issue of January 19, we would like to ask if it is possible for a man to go up to the furnace when the blast is on and dip a bicycle frame into the metal and continue doing the same for ten hours every day; also is it necessary to heat the frames before dipping?

Milwaukee, Wis.

ADVANCE BICYCLE CO.

In those factories where immersion brazing is now in practical use, workmen stand by the furnaces and dip the parts throughout the entire day without experiencing any excessively uncomfortable heat. In fact, operators say that the discomfort is no greater than when brazing at a blowpipe brazing stand, if it is as great. At present most of the operators of immersion brazing furnaces dip the work cold. It is, however, a good plan to heat the work before it is dipped, as this reduces the time required for immersion, and also prevents the spelter from losing heat through the introduction of cold parts.

### Stockholders Sure of Their Money.

A certificate of dissolution of the National Cycle Board of Trade has been filed with the secretary of New York state. The secretary of the board, George Hammann, is of opinion that the affairs of the organization will be wound up in a month. He adds that the firms which were elected to membership during the past year may with certainty count upon having the amount they paid for stock refunded.

### Humber Trustees Want Case Removed.

Arthur R. Martin and Frederick Goddard, trustees for Humber & Company, Limited, of Westboro, Mass., have filed a petition in the superior court in Worcester asking that the case of the B. F. Goodrich Company against the Humber Company and themselves be removed to the circuit court, on the ground that the parties to the suit are persons residing out of this country and in England.

### Buffalo Show Plan Abandoned.

Owing to opposition that developed at a meeting of the Buffalo cycle board of trade, called to take action on a proposed bicycle show, the project has been abandoned. The reason set forth by the opposers was the item of expense, which several manufacturers were unwilling to share.

When parties have a settlement of their accounts, and a check for the amount found due from one to the other, which recites that it is in full, is accepted, and afterwards paid, the presumption is that all items chargeable at the time are embraced in the statement.

## FOR UNIFORM FREIGHT RATES

### CONGRESS IS ASKED TO ASSIST

#### Review of Efforts Made in the Past Year to Strengthen the Interstate Commerce Commission.

Foremost among the powerful commercial organizations which aim at the amendment of the Interstate Commerce Law is the National Association of Manufacturers, which, in the course of its annual convention recently held in Cincinnati, reviewed the work done in this direction and held out hopes that the practical reforms contemplated would soon be in effective operation. Uniform freight classification and publicity for rates and contracts governing transportation are the main features in the general plan of reform.

#### Opinions Differ and Chaos Results.

It was ascertained some time ago that there was little or no possibility of securing conclusive action by the present Congress upon the subject primarily because the controlling elements of public opinion which are most vitally interested in the interstate commerce law hold widely divergent views as to the action which ought to be taken. These elements are: The shipping public, the transportation company, and the Interstate Commerce Commission.

During the year just ended the opinion of the Supreme Court disclosed the illegality of existing associations of carriers and of all agreements for the establishment and maintenance of rates of transportation. This disclosure contributed additional confusion to the chaotic condition already prevailing.

A large number of the commercial organizations of the country have urged that Congress restore to the carrier companies the right to make between themselves contracts and agreements, and to form associations for the maintenance of fair, equal and stable rates for the transportation of persons or property; stipulating, however, that all such agreements shall be subject to rigid and conclusive scrutiny, supervision and regulation by the government through its constituted agent, the Interstate Commerce Commission.

Many organizations have gone further and urged upon Congress that the carriers be invested with the right to pool or distribute their earnings, and that contracts made between carriers subject to supervision of the commission be legally enforceable between the parties:

#### Outline of the Reforms Planned.

In view of these facts and considerations, the transportation committee of the association recommended:

1. Absolute publicity of all rates, rules, regulations, contracts and agreements governing the transportation of persons or property between the states.
2. The enforcement of severe money penalties (not imprisonment) against any corporation, firm or individual through whose deliberate action any other than lawfully published rates, rules, regulations, contracts or agreements affecting transportation of persons or property between the states shall become current and available.
3. Permit common carriers, whether corporations, firms or individuals, to enter into contracts and agreements and to form associations and adopt all legal methods for the establishment and maintenance of lawfully published rates, rules or regulations governing transportation of persons or property between the states.

Provided, that all contracts, agreements or methods adopted between common carriers for the purposes above described shall be subject to control and supervision by the Interstate Commerce Commission to be void if disapproved by the commission; otherwise, to be legally binding and enforceable between the parties.

### Direct Freight Line to Russia.

The first vessel of a line of steamers to ply from New York and perhaps Boston

to St. Petersburg and other Russian ports on the Baltic, stopping on the way at Christiania, Copenhagen, Stettin and Riga, will leave this country the latter part of March or first of April, so as to reach St. Petersburg about May 1, when navigation opens there. The Scandinavian-American company expects to follow this with other vessels once a month, depending on the quantity of freight obtainable. Funch, Edye & Co., of New York city, have been appointed New York agents for the new line, which offers direct communication with Russian and some Scandinavian ports. Heretofore American goods have had to be transhipped at British or continental ports, which involved much delay and increased expense. Eight or ten weeks is usually required to land goods from this country.

### PROTECTION OF DESIGNS

#### Special Law Will Prevent French Manufacturers Copying Designs at Paris Exhibition.

Manufacturers who contemplate making an exhibit at the Paris exhibition in 1900, but are concerned lest their designs may be copied with impunity by French manufacturers because they have no manufactory in France themselves, as, according to a recent decision of the court of appeals, seems to be required by the French patent laws, may be completely reassured on the subject.

As a matter of fact, a law for the protection of the foreign designs exhibited is invariably passed before each world's show comes off; and it is stated on the highest authority that at the present date the exhibition officials and the ministers of commerce are engaged in drawing up a bill to this effect. It is certain that the decision of the appeal court will be provided against in the new law. Moreover, a measure for the extension of protection to industrial designs in general has lately been adopted by the senate, and will be discussed by the chamber of deputies when Parliament assembles. Therefore, there is not the slightest doubt that designs will be fully protected at the forthcoming exhibition.

### Overman Denies Rumored Offers.

One of the men employed in the office of the Overman Wheel Company, of Chicopee Falls, Mass., has approached a number of the creditors of the company and offered to buy up their claims for 60 cents on the dollar, which, it is said, gave rise to the rumor that the Overman company was making the offer itself. President Overman, however, stated that the company had never deviated from its original purpose to pay 100 cents on the dollar. Last fall he had stated that creditors would be paid in full and he has not yet seen any reason for changing his opinion in the least. Creditors, of course, have the right to accept or refuse any offers that may be made for their claims by persons not connected with the company.

### Law to Discourage "Fences".

A bill requiring dealers in second-hand bicycles to take out licenses has been introduced in the Connecticut legislature. The object is to keep improper persons out of the trade. The license fee is not so large as to annoy reputable dealers. By the provisions of the bill dealers are required to make weekly sworn statements of goods received and furnish descriptions of persons from whom they secured the goods, the books containing such statements to be open to the inspection of the police. A severe penalty is provided for destroying the nameplate or number on any machine or for re-enameling the bicycle or changing its identity within thirty days from the time of purchase.

PRESENTING TESTIMONIALS.

SOUTHERN MINNESOTA INSPECTION BUREAU.

WINONA, MINN. Dec. 6, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen—Answering your inquiry of recent date, I beg to assure you that my experience with the Puncture-Proof Tires purchased of your agents last June, has been entirely satisfactory in every respect, and although I have given them extremely rough usage they have required no repairs and are to-day apparently as serviceable as when first purchased. Yours truly,  
(signed) FRED J. LILLY, Asst Inspector.

RHINELANDER, Wis., Dec. 10, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen—It gives me great pleasure to say a word for the Milwaukee Patent Puncture-Proof Tire. I purchased them eight months ago and have never had a minute's trouble with them. Have tried all kinds of so called "Puncture-Proof Tires" without success until I purchased the "Milwaukee," which I believe to be the only Puncture-Proof Tire.  
(Signed) J. W. ATKINSON.

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.  
ALL remittances should be made to THE CYCLE AGE COMPANY.

## ADVANCE INSTALMENT SALES

At last a plan for pushing early retail trade in bicycles of high grade has been devised which suits manufacturers and retail dealers, both, and seems very acceptable to the public. The plan has been practiced before by live dealers, but only in a few instances and then not with that faith which springs from ripe conditions and then secures splendid results. This year it is being actively supported by manufacturers of the first class; branch houses are working the plan out under directions of their principals; and independent retailers are being encouraged to try it.

The plan is very simple. It consists only in selling bicycles in January instead of in April. The agent canvasses his territory to secure orders for bicycles in advance of the riding season and offers in return for the early orders easy terms of payment. The payments commence at once, but delivery of the bicycle is not to be made until the riding season opens or at a stipulated date. The selling price is the cash list and there is no interest on deferred payments.

It is easy to see why the plan of "advance instalment sales," as it might be called, has not become popular until this year. It was never as practicable in former years as it is now. The support of the public could not readily be obtained, until the public felt certain of two things, first, that no radical improvements would be introduced between date of order and date of delivery, and, second, the reputation of each particular manufacturer for whose goods they contracted. Both these factors have now become crystallized. Whether the purchase contemplated is that of a chainless bicycle or of a chain bicycle, the type is known and recognized as satisfactory, each to its devotees.

Further than this, sample bicycles have been on hand in the stores much earlier this year than ever before. The public can see what they are going to get.

The \$75 chainless machine, in its two principal forms, the bevel gear and the roller gear, very largely promotes the system, and the system, in turn, helps makers of chainless bicycles. The uncertainty in regard to their practicability has almost disappeared, and a large number of people wish to possess one. The advance instalment plan places it within their reach in a manner which agrees very nicely with ordinary human nature. The many who would wince at paying the higher price for their fancy when confronted with a cash purchase, stand ready to advance a small sum every week in return for the assurance that when the riding season opens they will have the mount which they really desire.

It is already acknowledged by those who commenced operating the plan in December that it favors the sale of the highest priced machines, whether chainless or otherwise.

## SALESMEN AND CREDITS IN EUROPE

An importer of American bicycles, who has always paid cash in advance for the product of our manufacturers, writes to The Cycle Age to explain that the European importers whose trade is worth having, not only have no objection to paying cash but would feel much relieved if all export business of American bicycle manufacturers were conducted on the cash-in-advance plan, as thus only the ruinous competition may be avoided in the European markets which now naturally follows when a consignment of American ma-

chines is sold at a sacrifice sale after being first hawked around to find a purchaser upon any kind of prices and terms.

He says in part:

To-day the market here belongs to the United States and it would be a pity to spoil it. I have collected orders for 1000 bicycles to be delivered in October, November and December, 1899, and for which bank guarantee will be placed as security that the entire lots will be taken and paid for cash in New York against documents. I am not partial to any special brand, but always open for a deal with everybody who would like to make offers and deal honestly and straightforward. A great many highly respectable firms in this city object to paying in advance and before inspecting the goods, for fear they may not get the value for the money. I do not know of what sad experience they may have had; as for myself, so far only one manufacturer disappointed me through unfair dealings. I need scarcely say what damage and bad feelings such actions may create and I do wish that you could find a way to stop such atrocious dealings, which will make it impossible for importers on this side to pay in advance.

In the same letter this importer who recognizes so keenly that his own trade chances depend largely upon the integrity of the cash system speaks of another matter of policy in connection with export business, as follows:

There is one thing special I should like you to point out for your manufacturers and that is that they should be most careful in selecting the travelers they send out here. I shall not speak of the extravagant habits some of them are indulging in, specially those not accustomed to continental life, but simply draw the attention to the great harm and annoyance arising from the fact that they are visiting all and everybody likely to order one or two dozens of cycles, stating their lowest export prices, granting ruinous conditions of sale and giving promises which never can be fulfilled; and all because they are naturally anxious to book orders justifying their heavy traveling expenses and strengthen their positions at home. In all cases where the manufacturers cannot come themselves they fare much better by submitting offers and samples.

The suggestion of supplanting the traveling man with the less energetic and slower system of submitting offers and samples, will hardly meet with general approval, but on the other hand, there is undoubtedly much room for improvement in the general human qualities of export salesmen. Unless they possess a certain sympathy for the most cultured forms of life and amusements, they are sure to offend continually against the sensibilities of nearly every European purchaser who is prepared to pay cash in advance.

They should by all means be of the same class as those representatives of European manufacturers who introduce foreign goods in this country—men who, if they have personal foibles, carefully avoid flaunting them before business associates.

• • • •

While everything else pertaining to bicycles and bicycle work is assuming more and more definite and final forms, it is a notable fact that the one department of tire repairs is lapsing in the opposite direction and is to-day in a chaotic condition. Few repairmen know of any system which they care to follow and many tire manufacturers do not seem inclined to assume much responsibility in recommending the elaborate plug and vulcanizing repairs which were shown by the traveling "demonstrators" at the beginning of last season. One of the results has been that the trade in vulcanizers has fallen off and another that repairmen jump at heroic measures, such as inserting inner tubes in single tube tires, when they are confronted with the smallest difficulty in effecting repairs by other means. The situation calls for a remedy and it depends largely upon the enterprise of tire makers in what direction the remedy shall be found. Considerable tire trade hangs in the scale awaiting intelligent action; yet little has so far been done to mold the prevailing indecision into popular preference for one or another repair method and convert the knowledge of the manufacturer's repair department into a valuable aid for selling the tires to which the knowledge may be applied.

• • • •

Among the signs of sound conditions of the cycle industry the constant inquiry for manufacturers who will place bicycles in consignment, is one of the most encouraging. The inquiries travel by letter or by word of mouth, and, if they met with response, they would never reach the office of The Cycle Age. But they do.

• • • •

Local cycle shows are good advertising if they pay, and if the local dealers are the exhibitors, and if the exhibitors are the managers. But, if they manage by proxy, the proxy should be one of their own number. He should be Their proxy.

## POOLING FOREIGN FREIGHTS

### Substantial Benefits Given to Manufacturers by an Organization Which Takes its Work Seriously

Manufacturers who send cycle goods abroad persistently slight the foreign freight question, and excuse their want of interest in the subject by stating that their customers are more concerned with it than the houses from which they receive shipments. This indifference to the interest of buyers invariably results in extortionate charges, and the unchecked practice of a variety of minor abuses seriously hamper the business of both buyers and sellers. Thus, for example, because the makers who sell bicycles to foreign customers through export brokers in New York will not bother themselves about ocean freight charges, their customers are put to the necessity of selecting a brokerage house for expediting deliveries and safeguarding the account which, not having strong connections with the steamship lines, is unable to quote the lowest ruling ocean freight or express rates, and as a result the customers buy more dearly than they might if the makers were more watchful.

#### Truckage Charges Are High.

Again, if foreign shipments are made from the interior to the seaboard, there are forwarding charges to be paid upon the removal of the goods from the cars to the docks, which charges are far in excess of the value of the services rendered when compared with the cost of similar service inland. This matter also is neglected by makers, when by pooling interests they might pitch upon one trucking establishment, give it all the business and so lessen the cost of forwarding. In ignoring the chance to economize at this point makers pinch both themselves and their customers.

Ocean freight rates are by foreign brokers based upon the extent of their dealings with steamship companies; the greater the volume of their freights, the lower the freight charges, and vice versa. Recognizing this fixed principle, certain members of the National Cycle Board of Trade last summer made an effort to have all shipments cleared through one export broker and have all trucking done by one forwarding house. The project met with ready encouragement from the bulk of the members, but the directors deemed it unwise to attempt so large an undertaking. The plan was labeled impracticable, much to the disgust and chagrin of those who, not having a hand in the shaping of board affairs, expected from the directors a sympathetic interest in the things conceived for the welfare of the majority.

#### Putting the Cycle Makers to Shame.

Now comes the National Association of Manufacturers—an organization which does not balk at common obstacles, nor shy with jealous apprehension whenever there is an obscuration of personal interest threatened—and proves how well grounded were the hopes of our makers. Its special committee appointed to organize an international freight and transportation bureau and devise a plan to aid sellers and foreign buyers, has easily performed the miracle which so awed the National Cycle Board of Trade, and in recounting its achievement makes report as follows:

This committee mailed a blank to every member of the association, calling for a report as to the approximate amount of freight each member shipped during the last year, from what ports it was shipped, and the ports of destination. From the information thus obtained the committee was able to determine the volume of freight shipped by the members responding, and its destina-

tion, and could then determine what steamship lines it was necessary to arrange with to carry such shipments.

This committee has been successful in consummating some very advantageous arrangements with steamship lines to certain ports, and is now negotiating with many others from different ports of this country to foreign ports, and hopes in the near future to be able to ship, under special contracts, every ton of freight offered it from any port in this country to all principal ports in other countries.

#### Connecting With Forwarding Agents Abroad.

Believing that it would be of great assistance to our members, and an aid to this bureau in carrying on its work, the committee had letters prepared and sent to all our consuls in all principal ports and cities in other countries, asking for the names of responsible forwarding agents in their consular districts, also the names of all steamship lines and railroads leaving, centering or touching at the principal ports or cities, with a list of ports or cities to which they carried goods. A very large number of replies have already been received, giving the information desired. These have been tabulated and filed, and are at the disposition of any member who asks for such information regarding any particular port of connection.

#### Collections on C. O. D. Shipments.

One of the most important features of the work of this bureau is the selecting and contracting with reliable forwarding agents in foreign ports. This has been vigorously pushed, and this committee has already completed some very satisfactory contracts and has many others well under way. Under these contracts the cost of receiving and forwarding goods to other ports or interior cities has been reduced in some cases to about one-half the usual rates. Collections of C. O. D. shipments can be made through the agents with whom this committee has contracts with entire safety and dispatch, or in case shipments are made and drafts drawn, they obtain the acceptance of the drafts and collect them when due at reduced cost. This will be a valuable feature for shippers sending goods to Russia and other parts of the continent of Europe, where the bankers will not handle documentary drafts. Through these agents the committee is able to contract at a definite rate for storage, by which goods can be stored and insured at reasonable rates, and be at all times under the control of the shipper through this bureau.

#### Substantial Reductions in Freight.

Contracts have also been made with transportation lines from seaports in other countries to interior and coast cities, by which substantial reductions in cost of transportation have been obtained. By reason of these various contracts, the committee is now able to inform shippers or buyers of the exact cost of transportation from certain ports in this country to nearly every port throughout the world, and nearly all principal cities of Europe, and it hopes in the near future to be able to give like information to every city of importance in all foreign countries.

#### Express Rates also Reduced.

This committee believed that a large saving could be effected in the matter of foreign express service; therefore it has gone into this matter thoroughly and is pleased to report that it has been able to make contracts by which the cost of sending goods by express to foreign countries has been largely reduced, in some cases fully one-half, and has besides greatly simplified the methods for such work.

#### Forwarding Shipments for Members.

This committee at first thought it would not undertake the attending to details of actual shipments, but it soon found that to be necessary; therefore it has completed arrangements and organized a service by which it is now receiving shipments from members and attending to all details pertaining to same, and is pleased to report that it has been able to render valuable aid to those members who have made use of its service, and is now prepared to attend to all shipments that members may favor it with.

#### Pass Book System Insures Safe Sales.

The pass book system for the retailing of bicycles is being quite generally adopt-

ed by the cycle dealers of Buffalo. This plan requires the payment of \$1 each week, which amount is credited in a book furnished by the dealer for that purpose, until a specified sum is credited. When the credits reach this sum the holder of the book is entitled to a bicycle upon which subsequent payments of \$2.50 weekly are required until the machine is paid for. The system was tried here last year for the first time and was pronounced the best of the installment plans in use. It affords a protection to the dealer and places the bicycle within the reach of everyone. The dealer has nearly one-half of the purchase price in his hands before a machine is let out and this, together with the weekly payments of \$2.50, places him in a position where loss is reduced to a minimum.

## PLANS FOR SPRING SHOW

### New York Promoters to Bring Retailers and Public Together at Opening of Riding Season.

The spring cycle show which is to be held in New York city in the Grand Central Palace at the opening of the outdoor riding season, the week of March 23 to April 1, under the management of Allen S. Williams, has been arranged for the benefit of the local dealers and the public in their relations with each other. A thorough canvass of the local trade has demonstrated that the dealers of New York city are ready to welcome an opportunity to reach the riding public at a time when it is ready to invest in bicycles, fittings, lamps, and other sundries, particularly if no restrictions are placed on orders being taken and, in the case of the smaller sundries, goods being sold over the counter.

Aside from the reasonable rate at which the spaces will be disposed of, and the ample room that each will contain, unusual concessions will be made in the supply of platforms, railings and electric lighting.

Besides the customary trade exhibits, special displays are to be made which will interest the general public. Under this head will come the most elaborate showing of racing trophies ever gathered together.

During the week of the show, parlors are to be set aside without charge for the meetings of any organization in the cycle trade. The League of American Wheelmen will be invited to occupy a booth, and so will the New York state division of the Century Road Club of America.

#### Bretz Will Aid Peck.

Jacob S. Bretz, who for a long time has been prominently connected with R. H. Wolff & Company, will on February 6 become assistant manager of the Barnes Cycle Company. Arthur R. Peck, the general manager of the Barnes company, will not relinquish his interest in or position with the company, but on account of the press of outside business affairs finds it necessary to pass over the bulk of his work to the competent hands of Mr. Bretz.

#### Milwaukee Repairmen Organize.

Preliminary steps have been taken toward organization by the repairmen of Milwaukee, with the object of regulating wages and prices for repair work. About twenty signatures were secured to a petition to the National Bicycle Workers' Union for a charter for a local organization.

#### Attempt to Injure Hilsendegen.

George Hilsendegen, the well known bicycle dealer of Detroit, was defendant in a case in the chancery court a fortnight ago, brought by the former manager of his retail store, W. C. Rands, who sued to recover \$1,500 capital, \$500 alleged to be

due as his share of the season's profits, and \$150 for salary. In rebuttal, however, Hilsendegen stated that his former manager wanted last year to have a share in the business and agreed to invest \$1,500 and receive \$100 per month salary and one-twelfth of the profits. Toward the end of the season there was a disagreement, he alleged, and his new partner withdrew and instituted suit. Then he stated that Hilsendegen was going out of business and asked that a receiver be appointed. In reply, Hilsendegen stated that he had no intention of disposing of his business and that the motion was made only for the purpose of injuring him. Altogether he claims to have been damaged to the extent of \$4,000 by Rands.

**LASLEY'S APPEAL CASE**

**He Will Contend That Second Hand Trading is Not His Business, Being Only Incidental.**

Washington, Jan. 28.—The case of J. D. Lasley, who was convicted some time ago of being an unlicensed second-hand dealer, will be argued in the Court of Appeals on February 7. In his plea Mr. Lasley contends that his dealings in second-hand bicycles form only about 5 per cent of his business as a bicycle dealer. That is to say, his trade in second-hand bicycles is not his business, but is a very small part of his business, and is merely incidental to it. He further contends that the law of March 3, 1891, was never intended for the class of business men to which he belongs, it being inconceivable that Congress intended any such scope to be given to the law by the use of the phrase, "dealers in second-hand personal property," a phrase which is in common use and has a well known and accepted meaning, i. e., those who deal principally or exclusively, or, to use the language of the statute, "whose business it is," to deal in second-hand personal property.

The act shows upon its face that it was intended to apply to junk dealers and pawnbrokers and others who fall within the general class to which junk dealers and pawnbrokers belong, and was evidently framed for the purpose of facilitating the efforts of the police in tracing stolen property.

In the event that the decision of the lower court is sustained, the bicycle dealers, in common with other merchants, will strongly urge the repeal of the statute.

**EXPORTERS NOT CONCERNED**

**American Manufacturers Think Action of German Makers Will Have Little Effect.**

Further communications upon the subject of the action of the German bicycle makers in denying credit to agents who handle American bicycles are herewith presented:

**One Way of Escaping Effects.**

The failure of the German prohibitory import duty and the after action of the German manufacturers' association, we are pleased to state does not affect the Racycle, inasmuch as our bicycles are now being manufactured in Germany, and have been for the past six months or more. It may also be of interest to know that we will commence the manufacture of the Racycle in Canada within the next two weeks.

THE MIAMI CYCLE & MFG. CO.

**Will Not Affect Responsible Dealers.**

We do not think the arbitrary stand taken by German manufacturers would have much effect upon dealers who have ample capital to carry on their business with, as they could very readily buy their goods for cash, as well as handling the American lines they usually represent. It will not affect us in any way whatever.

IVER-JOHNSON ARMS & CYCLE WORKS.

**Will Cut Off Some Trade.**

The proposed action of the German Bicycle Manufacturers' Association will undoubtedly cut off some of our trade for the present at least, but as we have all we can do for the present we are not worrying over the matter. These things usually right themselves in time.

THE GENEVA CYCLE CO.

**TO PAY OVER EIGHT PER CENT**

**ENGLISH PROFITS THIS YEAR**

**Price Cutting is Expected — Machines Listing at \$50 Will Command Ready Sale.**

It is calculated that in the present year the average English cycle making firm will make 8½ per cent on the actual cash invested. Last year the profit was 7 per cent, and the year before 13 per cent.

It is by the Irish Cyclist reckoned that in the entire cycle trade and its ramifications \$155,000,000 is invested. The figures are too large, as they were based on the returns of many prospectuses which never got their full capital. Probably \$135,000,000 would be nearer the mark.

Total Capital is \$135,000,000.

Taking the returns of the leading companies, whose aggregate capital is \$56,250,000, it is found that in 1897 there was a net profit of about \$7,250,000 made, or an average profit of 13 per cent; that is, dividend paying profit.

On the capital of \$56,250,000 there has been a decline in dividend profit of \$3,257,905 in 1898, as compared with 1897. Taking these figures and working them out for the total cycle trade capital of, say, \$135,000,000, it is found that shareholders lost about \$7,818,970 profit last year. In all probability, however, the total loss would come out at a much bigger figure, for no account is taken of mushroom firms which lost money on their trading.

**Rich Harvest for Insiders.**

Out of the \$56,250,000 the Dunlop company holds 40 per cent. Out of the total profit they earned 56 per cent. Again, taking the entire cycle trade capital at \$135,000,000, the total net profits last year work out approximately at \$9,754,275, and of this the Dunlop company earned almost one-fourth.

The highest dividend of the year was paid by the Palmer Tire Company, 40 per cent being the abnormal figure. On a capital of \$245,000, they earned \$120,950.

**Price Cutting Will be Prevalent.**

Profits in 1899 will be affected by price cutting. There has been over-production. Firms with big factories must keep their works going, and to do so are prepared to reduce the profits to a very small margin. Other firms are in the unfortunate condition of having large stocks and no working capital. To turn the stocks into working capital, they will sell even at a loss. Worse still will be the effect caused by the inevitable liquidation of a number of the mushroom concerns floated during the boom year or of those that were launched with such absurdly small working capital that they cannot continue in business. These concerns also have stocks which must be disposed of at less than cost price by forced sales either under the auctioneer's hammer or otherwise. Then there will be the competition of new firms possessing no good will, who will only seek to make a profit, say of 10 per cent on the actual cash invested.

**The Demand for Cheap Machines.**

A very large proportion of the trade will be done in a ten guinea mount, and no matter how careful or capable the makers may be, the utmost net profit they can legitimately make on such machines is about \$5 each, or in other words 10 per cent on their turnover. If there was no goodwill this would be a fairly satisfactory return, but every public company is saddled with goodwill, some to a moderate extent, but in most representing far more than the tangible assets. It will easily be understood that in these cases 10 per cent on the turnover will rep-

resent a comparatively small return on the total capital. In many cases not even 10 per cent will be earned on the turnover in cheap machines.

The Belgians and the Germans can completely undercut the English in the cheapest class of bicycles. For example, it is said that the Belgians can now sell machines wholesale in England fitted with English tires, saddles and chains at a trifle over \$25 each.

**Estimating the Turnover for 1899.**

The turnover of the firms that weather the storm with few exceptions can scarcely be as large as last year, notwithstanding that more machines will be sold in the aggregate. The forced sales of old stocks will affect them, and most of the leading firms have been afraid to make stock, so that no matter what the demand is when the season opens, they can only do four or five months trade at anything like full pressure.

To sum up, therefore, it is believed that the good, solvent concerns will only be able to earn for the present year a net profit of from 5 per cent to 12 per cent on the actual cash invested in their businesses or an average, say, of 8½ per cent. That is to say, supposing a firm doing averagely well has a capital of \$1,000,000, and if its goodwill stands at \$500,000, and plant, working capital, premises, etc., at \$500,000, the net profits will work out at about \$42,500, enabling a dividend of about 3½ per cent to be paid. Some will do better and others worse. Of course, where the goodwill is small the dividend may be 5½ or even more.

**Exports of Cycles and Materials.**

Exports of bicycles and bicycle materials from the port of New York for the week ending January 24 are recorded as follows:

	Bicycles. Materials.	
Holland ..	\$ 4,007	\$ 4,045
England ....	1,810	5,362
Denmark ..	3,346	3,701
British Africa ..	5,955	.....
Italy .....	4,544	2,550
British East Indies.....	5,198	.....
Russia .....	149	4,174
Australia ..	2,453	1,280
Germany ..	2,720	89
Sweden ..	538	431
Argentine Republic .....	880	20
Belgium ..	125	626
British West Indies.....	324	211
Turkey ..	375	.....
Cuba .....	150	18
Brazil ..	80	84
Other countries .....	129	2
Totals ..	\$32,783	\$22,593

**Will Attend to Paris Exhibits**

The Cycle Age is able to refer an American manufacturer of bicycles, tires or accessories who contemplates an exhibit at Paris in 1900 to an American at present in Europe, who can handle every detail. The gentleman in question can arrange for space, fit up the exhibit, clear goods through customs, make translations, and has an excellent connection among European buyers.

**Decision Against Barnes Co. Reversed.**

A new trial has been granted in the case of the Barnes Cycle company against Charles M. Reed, brought to recover \$3,018 as surety for Leo Chlaudecker, who was agent for the company. A verdict for the defendant was rendered in the circuit court at Pittsburg, but Judge Acheson, of Philadelphia, reversed the finding.

If a contract expressly provides that delivery shall be made at a certain place the seller's title to the property is not divested until delivery has been made at such place.

The Pittsburg Cycle Board of Trade has decided to hold a local bicycle show during the week of February 11 to 18.

## AGENTS EXPECT HEAVY SALES

### High Priced Bicycles Will be in Strong Demand—Maker's Reputation Valuable This Year

The commercial reputation of a bicycle maker will play a very important part in the approaching season of sales. This is the opinion of many bicycle agents who have been solicited to hazard a guess as to what the future contains, both for them and the establishments they represent. It seems to be the general opinion that the volume of sales will be increased, a conclusion reached upon consideration of the lower prices which are ruling upon machines of all grades as well as the improved condition of general commercial affairs.

#### Standard Patterns Will Sell Well.

Quite an important prophecy is variously put forth in the appended communications with respect to the sale of high priced machines. It is believed in many parts of the country that standard patterns will sell to better advantage in the coming season than heretofore, and excellent reasons are adduced in support of this belief, the chief of which is that the slight difference in cost between standard bicycles and those which are nearest to them in grade competition will prove helpful to the high-priced models and correspondingly disadvantageous to those which are sold at prices slightly under them. It is at this point that the reputation of the makers of standard goods plays a conspicuous part.

#### Reigning Conditions Are Favorable.

To be sure, it is as yet a little early to indulge in prophecy of this sort. A delay in the breaking of the winter in the northern states or the sudden appearance of an unlooked-for event in the national life might, as was the case last year, suddenly put an end to day dreams. The reigning conditions, however, so far as they may be useful in piercing the future, are favorable. Here and there local conditions will operate disastrously to the retail cycle trade, particularly in such quarters as are affected by strikes, bad crops, and the like evils, which are unavoidable even at a time when the mass of the people are in a condition of prosperity.

#### Not Satisfied With Treatment Received.

I think sales may be somewhat greater than last year if weather holds good. I think the lowered list price will make no difference, as the people who will buy the \$50 machines this year would have bought them just the same if last year's list had been adhered to; others will buy the wheels selling at \$25. There will be very little difference in ordering by the dealers, although some are going out of the business. As for ourselves, we shall pay more attention to the repair part of the business, as we are not satisfied with the way the manufacturers have treated the agents in the past—they have catered to the hardware and department store trade and neglected the agents who have made their business, although we will say there have been a few exceptions.

New Hampshire F. B. PARSHLEY & Co.

#### Dealers Reducing Their Lines.

The general impression is that fewer bicycles will be sold this season than in '98 in this city. The lowered list will have little effect here. Dealers are buying more carefully and not so many kinds.

New Hampshire R. E. WILM'T.

#### Evils Descending from Last Year.

I think that the sales of bicycles will be less than last year because there is not the interest shown by riders that there was last season. Lowered prices will have a good effect upon the public, but bad effect on the dealers. Bicycles this season will cost the dealers about the same as they did last season, while list prices are not nearly

so high. A large proportion of machines put out last year were of low grade and were listed for nearly twice what they were expected to be sold for. That class of bicycles was handled mostly through department stores, and parties selling them offered large discounts to the public to buy them, which discount was taken advantage of. They also allowed for old mounts double what they would sell for. Now this season riders are looking for the same thing, which no dealer can afford to do if he depends upon the bicycle business for a living. Dealers are not buying more freely than last season. There are not so many in the business and those that are in it—that is, those who are in the bicycle business alone—are more careful what they buy.

Massachusetts.

J. A. TINPANY.

#### Will Feel Effects of General Prosperity.

I am looking for increased sales in '99 because it will be a prosperous year in business generally. The lowered list prices will have a tendency to increase the bicycle trade and to dispose of better grade goods. I am buying somewhat more freely this season, but do not know about the other dealers in town.

Vermont.

E. FRANK LAM.

#### Dealers Consulting Conditions.

Sales in this city will be larger than in '98, the effect of lowered list prices being to increase the demand. Dealers are buying more carefully than usual.

Massachusetts.

HEDGES CYCLE CO.

#### More Sales Expected.

The sales of bicycles will be greater this season than in '98, as the lowered list prices will create more demand. Dealers are not yet buying as freely as usual, however.

Massachusetts.

GARDNER R. HATHAWAY.

#### Strike Spoils Local Prospects.

The sales of bicycles in this city will be less than in '98, although the lowered list prices will create more sales than if prices had remained the same. The dealers are not buying as freely as usual. There is a general strike going on here and more than 3,000 people are thrown out of work, thereby bringing business to a standstill.

Massachusetts.

MARLBORO RUBBER CO.

#### Public Convinced at Last.

We expect to do a larger business this year. We think the general public feels confident that prices are about as low as possible and that a satisfactory bicycle can be bought for \$25 or \$35, which enables many more people to buy. Dealers here are ordering samples much earlier than usual.

Connecticut.

C. H. MINCHIN & Co.

#### Will Keep Standard Goods on Market.

I think sales will be about a third larger. I believe lower prices will be the means of keeping the first-class machines on the market instead of flooding it with cheap ones. Dealers seem to be buying more freely than usual.

Connecticut.

G. B. PARSONS.

#### Sales Will be About the Same.

Sales will be about the same this season as in '98, lowered prices tending to increase the demand somewhat. Dealers are not buying freely at the present time.

Connecticut.

D. S. SPENCER.

#### Shoddy Goods Will be Crowded Out.

More bicycles will be sold this year than in '98, the demand for them being for business purposes as a means of locomotion and not generally for pleasure as in the past two seasons. The lowered list prices will make customers for high grade machines and ruin the sale of cheap wheels—that is, the shoddy, thrown together kind. The dealers are not buying so freely as usual this season, but are all waiting for spring and to see just where they can get the best bicycles for the least money.

Delaware.

HOWARD G. SAPP.

#### Outlook Much Improved.

We are unable to fully determine from the present outlook what the season will be, but the prospect is a great deal more favorable than last year at this time. The

lower prices will, we think, have a tendency to induce the people to exchange their mounts for others more up-to-date. When the dealers open up for the season they will, we believe, buy more sample machines than they have recently done. We have placed orders for about three times as many as we have ever ordered before. We do this thinking it will make more of an impression on the public and induce them to buy, where they would not if they did not see the goods and notice the improvements.

Rhode Island.

CRESCENT CYCLE CO.

#### Reputable Goods Will Have the Call.

Sales will be greater than in '98. Low prices will have no effect. A good make of bicycle at a fair price will take the lead. Dealers are not buying any more freely than usual as yet, but we believe they will later on.

New Jersey.

BRIDGETON CYCLE CO.

#### Buying More Heavily Than Usual.

The sale of bicycles in this vicinity with me, at least, will be greater this year than last, because I have more machines spoken for already by good parties than I sold the whole of last year. Lower list prices will have a tendency to create more demand for wheels among the middle class. What the other dealers are doing I am not able to say, but as for myself, I am buying more heavily than in any season heretofore.

New Jersey.

BUD VAUGHN.

#### Run on Cheap Bicycles Expected.

We expect to sell more bicycles this year than last, because we are selling them at a smaller profit and they are better looking machines than formerly. Lower prices will certainly sell more, as this is a cheap town and supports lots of dry goods store wheels, which are used by the working classes. The wealthy patronize Philadelphia, only thirty-five miles away. We had a big run on \$25 wheels of our own make in '98.

New Jersey.

VINELAND CYCLE HOUSE.

#### Dealers Pushing Their Own Makes.

The sale of bicycles for '99 will be about the same as in '98 for the reason that bicycle riding has ceased to become a fad and the riders will purchase only through necessity due to wear and tear, which will keep the sales about normal. The prices are practically the same here as last year. The purchasing tendency seems to settle on low price guaranteed machines. Reliable makes and the sale of strictly high grade wheels for more than \$50 will fall behind. The dealers are not buying as freely as usual with the exception of myself. They are pushing bicycles of their own manufacture, which sell at about \$35. Therefore the buying of manufactured machines is practically limited to myself.

New Jersey.

BENJ. A. LUTHER.

#### Beginning to Realize Bicycle's Utility.

Sales in our city will probably be greater this season than in '98, for the people are beginning to realize what a necessity and convenience the bicycle is here, where we have good roads and fairly good weather. Since the price list has been lowered more persons will be able to purchase for the first time, and old riders can obtain new mounts. For the most part dealers here buy as the orders come in and do not carry a large stock.

New Jersey.

JOHN H. BAWDEN JR.

#### More Reputable Machines Will be Sold.

We predict fewer sales here in consequence of the dealers being more conservative in making credit sales and also in taking second hand bicycles in trade. We expect as far as our own sales are concerned to sell more new machines, however, as we are refusing second hand wheels in exchange, excepting at very low prices or allowances; consequently we will sell cheap new goods where we formerly sold second hand goods to this class of trade. Customers will take the better machines for the same prices they were willing to pay in '98. There are fewer dealers here than a year ago and these are buying more conservatively, although personally we are placing orders about as usual during '96-7-8.

New Jersey.

GARRETSON CYCLE CO.

#### Dealers Buying Cautiously.

We think that the sale of bicycles in this town will be at least equal if not greater than for the past two seasons. The lower prices will cause a bigger demand. Most of the dealers here have been burnt the last year or two, so are not buying much.

Maryland.

WM. A. MORSE.

#### Public Wants Good Bicycles Cheap.

The outlook is very encouraging and with a fair season sales should be larger. A good bicycle for \$25 is what the people have been trying to get for several years, and this is the first season, in my mind, when one could get a good machine for so small a

sum. I will not do any ordering until the weather gets normal again, it having been bad since October.  
Virginia. C. B. M. KENNIE.

**Low Price of Cotton Injures Prospects.**

I think sales in our city will be less this year. The demand is supplied and there is a scarcity of money, owing to low price of cotton. The lowered list prices will very likely have some effect in increasing the demand, for the lower prices place wheels within the reach of the negroes and poor whites. Dealers in our neighborhood are not buying any more freely than usual.  
South Carolina. SOL. J. RYTENBERG.

**Sales Will be Increased.**

The sale of bicycles will be greater this season than in '98, one of the causes being the lowered list prices. The dealers in this neighborhood are buying more freely than usual.  
Alabama. W. M. FLORENCE CYCLE CO.

**Riders Will Practice Economy.**

Fewer bicycles will be sold this season than last, as the consumers are nearly all supplied, and agents cannot afford to take second-hand machines in exchange. The reduced list prices will make the inclination to buy strong, but riders will say, "Wait until I sell my old wheel." Dealers are not buying so freely as usual this season.  
Pennsylvania. WARREN SAVINGS BANK.

**High Priced Machines Will Sell Best.**

I am looking for greater sales this season than in '98, everything being favorable. The low priced bicycles will not sell as readily as the \$50 to \$75 machines. I will carry a larger stock than I had last year, but don't know about the other agents.  
Pennsylvania. JAMES S LYONS.

**Decreased Trade Expected.**

We think that the sale of bicycles will be less this season than in '98, notwithstanding the lowered list prices may have a tendency to stimulate the demand. Dealers are not buying as freely as usual this season.  
Pennsylvania. EBY & SPONEBOYR.

**Chance for Enterprising Salesmen.**

I fully expect a better trade this season than last, although I made more money last season than in any previous year. Plenty of money and work in the vicinity is my reason for expecting an increased trade. The lowered list prices will have the desired effect. The price of high grade wheels is so near the average purchaser's price that he will strain a point and pay the difference. My customers have so expressed themselves. The disposition of the rider this season is to buy as high priced a machine as it is possible for him to purchase. It is quality they are after this year, and the new prices have inspired that desire. Dealers are buying very judiciously what they are absolutely sure of selling before the season is well past. This is the year for good salesmen to get in their work, as they can sell to purchasers who have been paying the past two seasons \$25 per wheel, a \$35 or possibly a \$40 machine. Customers who paid \$35 can easily be induced to pay \$50. And the others will buy chainless bicycles and be up-to-date and happy.  
Pennsylvania. C. W. KEEFER.

**Outlook is for More Sales.**

Present indications are that sales will be greater than in '98. The lowered list seems to be the demand of the trade.  
Ohio. L. V. LASH & CO.

**More High Class Machines Will be Sold.**

I think the sale of bicycles in our city and vicinity will be greater this year than last and that on account of the reduction of prices a larger percentage of high class machines will be sold. The dealers here are very conservative and are not buying liberally now.  
Ohio. J. K. BOWMAN.

**Dealers Slow in Ordering.**

I think that the bicycle trade here will be about the same as in '98. From \$25 to \$35 bicycles are what the average rider wants here this year. I believe the local dealers are holding back a little more than they have in the past.  
Ohio. W. E. REX.

**Slow Collections Expected to Hurt.**

There will probably be fewer sales than in '98, as money was never harder to collect than now. This will largely influence the trade and only the lower prices can cause equal or greater sales. Dealers here are not buying much at present.  
Ohio. D. S. PRENTICE & SON.

**Purchasing Power Increased.**

I think more bicycles will be sold this season than last, as more people have employ-

ment. Lowered list prices will help the poorer classes to get wheels. The dealers are buying more freely than last season. I have several more lines.  
Ohio. F. S. CULP.

**Low Prices Suggest Poor Quality.**

I think this season will be a good one. It is a good idea not to list bicycles too low, for price governs the grade of the machine. Dealers are buying about the same as last year.  
Ohio. MOSES CRUMBINE.

**Reduced Prices Will Increase Sales.**

I think we will sell more bicycles than last season, on account of the lower prices this year. Dealers are buying a few machines.  
Kentucky. H. A. REESE.

**Sundries Trade on Good Basis.**

From present indications the sale of bicycles will be much greater than in '98. The lowered list prices will be an important factor in this increased demand. Our dealers are conservative and having facilities for getting wheels quickly, carry only samples, but a much better feeling exists. The bicycle sundry trade is nearer to a legitimate business basis, and altogether more satisfactory business is anticipated.  
Missouri. J. E. ATKINSON.

**A Pessimistic View.**

We do not look for much, if any, increase in sales this season, even if the weather conditions are perfect. Another late spring, as in '98, and the sales will be even less, as interest of old riders is waning and there are no new recruits. We do not think that the lowered price list will increase the demand, as the person who will purchase a bicycle at the present list would have done so had the prices remained the same. People who have been waiting for prices to drop will say, "I told you so"—and wait another year. A person who wants a bicycle and has the money will invest whether the prices be lowered or not. The person who is short of funds can pick up good second-hand wheels any time. Dealers are not making haste to place orders, as in former years. Any amount of good machines can be bought late in the season.  
Missouri. E. L. CHAMBERLIN & CO.

**Expect Larger Business.**

We think that the sale of bicycles will be greater this season than in '98, because of lowered prices. Dealers here have not placed their orders yet so far as we know.  
Minnesota. DICKERMAN BROS.

**Lower Prices Will Help Trade.**

The demand will be greater this season because buyers can now get a first class machine at a reasonable price. A great many in the past would not buy an inferior wheel and could not afford a good one. Others will also invest in new mounts. Dealers are taking more interest than usual, but they never lay in a large stock at this point at this time of the year, as the season will not open here until the first of April. But most dealers have closed contracts here for '99.  
Minnesota. A. L. HOFFMAN & CO.

**Agents Buying Very Freely.**

I think that the sales of bicycles will be much greater than in '98, as lowered list prices will cause some people to buy more freely. The dealers in this city have contracted for about twice as many machines this year as last.  
Minnesota. G. W. CLINE.

**Farmers Want Cheap Machines.**

I am of the opinion that there will be more bicycles sold this season than in '98, as the lowered price list will increase sales to the farmers, who, as a rule, want a cheap article. I do not know of any dealer in this section who has as yet bought any more than a sample. As usual no buying is done here until March.  
Minnesota. W. H. DAVIS.

**Winter Riding Helps Trade.**

I think at least one-third more bicycles will be sold here in '99 than in '98, as the lower prices will actively increase the sales. Dealers are purchasing more. We have had an ideal bicycling winter, as so far we have not lost three weeks of the good roads.  
Nebraska. QUEEN CITY REPAIR WORKS.

**Better Grades Will Sell Well.**

We expect the sales to be greater this season than in '98, owing to the lowered list prices. Most people here cannot afford to buy high priced machines, but the present prices bring them within their reach. I think there will be fewer of the cheapest makes sold, as there is such a small difference in price between the best and the trash.

No dealers besides myself have as yet received samples.  
North Dakota. R. J. HUGHES JR.

**Country Sales Will be Better.**

Sales here the coming season will be normal. Lower priced bicycles will increase the sales in the country. Dealers are not buying freely.  
Minnesota. FRED O'REILLY.

**Everybody Has Been Supplied.**

The sales will be less this season than in '98, as nearly every one is supplied. The lowered list prices will have no effect. For these reasons the dealers here are not buying as many machines as usual this season.  
Colorado. SMITH & KESTLER.

**Easy Money Will Benefit Trade.**

I sold about thirty-five bicycles in '98, and expect to do better this year, as money is getting easier. The lowered list prices will necessarily enable many to buy who could not afford to buy high priced wheels. I believe that I am the only local dealer who has ordered yet.  
Idaho. C. J. JOHNSON.

**Buy Bicycles for Business.**

We believe that the sales will be slightly increased, owing to prices placing the machines within the reach of many who could not purchase before. The lowered list prices also create a desire among a great many riders to replace their old mounts with more up-to-date ones. The demand is gradually changing from those who buy for pleasure riding to those who use the bicycle for practical purposes and would not ride except for economy. Dealers are buying earlier and I believe some are placing larger orders this year than last.  
Oregon. ROSCOE LANGLEY.

**More Standard Machines Will be Sold.**

We expect that more bicycles will be sold this season than in '98. The effect of reduced prices will be to cause the buyers to give more attention to close buying and dealing in more standard lines. The dealers are buying about 25 per cent. more than last year.  
Oregon. W. T. BOOTH & SON.

**Lower Prices Will Make More Sales.**

More bicycles will probably be sold this season than in '98 because of lower prices. The dealers in this neighborhood are buying the same as last.  
Oregon. WM. L. SHIVERICK.

**Dealers Preparing for Large Sales.**

I think the sales will be greater this year than in 1898, the demand being helped by the lowered list prices. Dealers in our neighborhood are buying more freely than usual.  
Kansas. H. I. SPURLOCK.

**Asphalt Paving Will Increase Riding.**

We expect a much greater demand for bicycles in this vicinity this year than ever before, one of the reasons being the large amount of asphalt paving being done in this city and another the low prices for which the high grade bicycles are being sold. As far as we have been able to learn, the dealers of this city have been buying quite freely. The prospects are very flattering for a good business.  
Texas. C. L. & THEO. BERING, JR.

**Dealers Cheerful and Ordering Liberally.**

Sales will be greater than last year, owing to lowered list prices, which are the best inducement to wheel life. The dealers in this neighborhood are buying several times more freely than usual. It has been two years since there was a "craze," financial conditions are better, and all prospects are encouraging.  
Texas. J. E. LIGHT.

**Better Quality Will be in Demand.**

The sales of bicycles this season will fall considerably short of those of '98. The lowered price list will have no effect. I think high grade bicycles will be more in demand. Dealers are not buying as freely as usual as trade at present is too uncertain.  
Texas. MARCH CULMORE.

**Disgusted With "Nasty" Goods.**

I think sales here will be less this year than last, even with good weather, because there were quite a large number of cheap wheels sold here last season which gave lots of trouble and people seem to be disgusted with bicycles. I don't think that lowered prices will have much effect in this locality, as people seem to take no interest in cycling. It is very common to hear people assert that bicycles cost more to keep than a horse. I don't know of any dealers buying more freely than usual.  
Texas. E. M. WINFREY.

## COMMERCE IN FOREIGN MARKETS

### VENEZUELANAS WANT TO BUY DIRECT

The Venezuela merchant is averse to dealing with the jobber or middleman, and would rather buy direct from the manufacturer and thereby save commissions. The jobber does not care whose goods he sells, nor where they are sold, so long as he makes his profit; consequently, his efforts are directed toward selling them at home, where there is less expense and trouble in handling the goods, but only a small margin of profit for the manufacturer, which causes the overcrowding of the stores at home and a reduction of prices for lack of demand.

There is no use in sending traveling salesmen to the South American countries who do not understand Spanish and cannot accommodate themselves to the habits and customs of the people, pre-eminently different from our own. A man must first of all be a gentleman in every sense of the word. Polish goes a great way there. Things can not be done in a rush, but persistence and hard work will tell. Many American drummers sent to those countries to sell goods are, on account of their behavior, a detriment to American business.

American goods can undoubtedly stand the highest competition and will sell alongside the best of European makes. They are in many cases admittedly superior and fully as cheap. Now is the time for the American manufacturer to introduce his goods into those markets, and with the application of his usual common sense, he can reap the benefits of an immense commerce, which is today sadly neglected.

### ENGLAND'S SCHEME FOR COMMERCIAL DEFENCE

Great Britain takes approximately 20 per cent of Germany's total exports, amounting to about \$175,000,000 annually. Germany, in short, gives England a hundred years' start; gives her a vast world of colonies peopled by her own sons, who would naturally desire to buy from her; gives her a vast fleet of merchant vessels to carry her own manufactures under her own flag; and then, herself a unified country for less than half a century, she competes successfully with England in her own commodities and her own markets—home, foreign, and colonial.

The competition of the United States has not reached the volume of that of Germany, nor has it been exercised so markedly in directions that, up to now, England has considered peculiarly her own. It has not, therefore, attracted quite the same attention; but it is regarded with serious concern, and with a conviction that it is destined to develop, in the near future, into imposing dimensions.

Confronted thus by German and American competition, plans of defense have naturally exercised the minds of the merchants of England; and the most important and far-reaching of these no doubt has been the idea of an imperial customs union, with protection against the rest of the world. The colonies have come politically much closer to the mother country during the last part of this century; and the idea of imperial federation has fired the imagination and stirred the heart of many British subjects. That the political effect will be important most people believe; that the commercial or fiscal result will be considerable is much to be doubted. The inexorable logic of figures proves that two-thirds of England's overseas trade is with foreign countries, one-third with her colonies, and that an imperial Zollverein would mean the sacrifice of the larger share of her commerce to

the smaller portion. Besides this, free trade between England and her colonies and a tariff against the rest of the world would mean a tariff in England on food products. Now, in 1896, England imported from the United States more than \$500,000,000 worth of commodities, most of which were food products; and this sum exceeds the total importations from all the British colonies together, including India. With the balance of political power in the hands of the workers living in towns, whose first demand is the "cheap loaf," it may at once be seen that the idea of the Zollverein will not develop. Wherever practicable, however, such degree of reciprocity as is at all possible will doubtless be entered into.

### DUTCH TRADE WORTH SEEKING

With the exception of the traffic with her own colonies in the Indies, and with South America, which is very extensive, the export trade of the Netherlands is very limited. Holland is practically a free-trade country, the average import duty being only 5 per cent ad valorem. German and Belgian machinery, tools, and other industrial products find a ready market there, and all the American manufacturers have to do in order to get their share of the trade is to send active and energetic representatives to introduce their wares and appoint local agents for the sale of them.

It has been the custom of many American manufacturers, when disposing of European territory to agents, to include the Netherlands in some German agency. Probably they think that Holland is too small to warrant the establishment of separate agencies there. If the Holland trade is worth having, it is quite safe to say it can be obtained only by intrusting the agencies to natives, or at least to residents of the country. There are two reasons for this. One is, while Holland is a small country, the Hollanders have a great deal of native pride, which even extends to business matters and makes them protest against being considered an annex to another territory. Another reason is that German or other agencies pay but little attention to the Netherlands trade. They take, of course, what they can get, or what may naturally come to them, but they expend no money or energy towards procuring business for or advancing the interests of the American houses they represent.

### TARIFF CHANGES IN BELGIUM

A deputation of delegates from the various foreign chambers of commerce in Belgium—Anglo-American, French and German—recently had an audience with the minister of finance for the purpose of advancing their objections to the proposed new law inaugurating changes in the present system of levying customs duties on goods taxable ad valorem and, if possible, securing the withdrawal of the bill.

The representatives of the government defended the bill and claimed that there were many points in the Government's favor—for instance, that some importers of foreign goods into Belgium, taxed ad valorem, have adopted the rule of having the names of their respective firms printed on the goods. These goods are then declared at a figure far below the real cost, and here the government is absolutely powerless to protect itself, because if the customs authorities seize these goods on account of undervaluations, they are unable to dispose of them

either at private or public sale, owing to the fact that the name of a certain firm or individual is imprinted upon each article. The delegates readily concurred with the government representatives on this point, and even requested that stringent measures should be taken to prevent this fraud in future.

On the other hand, the delegates maintained their opposition to the proposed law on all points bearing upon the importation of foreign goods into Belgium, wherever such importation is practiced upon an honorable and equitable basis. They told the government representatives that the system of pre-emption as practiced at present must be maintained; but, in order to put the customs authorities in a position to prevent all possible fraud, the delegates agreed to abandon the bonus of 10 per cent which the government actually pays in addition to the value of the seized goods, or, in other words, give the importer the right to simply abandon his goods in case the custom-house officers should find the valuation too low. They also pointed out the inevitable delays which would result in the delivery of goods to the importer if the proposed change in the present law should be adopted by the legislature, and the arbitrary decisions which the contemplated commission, in case of contested valuation, might render, and from which there would be no appeal. It is believed that a favorable consideration of these demands may be soon expected.

### COLLECTING FOREIGN ACCOUNTS

The question of foreign credits brings up a point that is of considerable importance. It is of no less importance to know of disreputable concerns than to be advised of houses that are solvent and honest. In one instance a manufacturer in New York had a long-standing account in Vienna which he had been unable to collect by any agency at his command; finally, as a last resort, he wrote to his customer that unless a prompt settlement should be made the matter would be reported to the National Association of Manufacturers. The reply was a remittance in full by return mail. A member in the west had similar difficulty with a purchaser in Norway, and upon suggesting a reference of the matter to the National Association an immediate settlement was secured. The mails were too slow for this delinquent, who cabled instructions to a bank in this country for the payment of the account, amounting to \$600 and over.

### German Exports and Imports.

During the first ten months of last year Germany exported 34,744 bicycles and 8,455 cwt. of parts, while her imports were 43,275 cycles and 1,706 cwt. of parts. America sent 28 cwt. of tires and England 58 cwt. Of saddles, America contributed 395 cwt., England 335 cwt., and France 106 cwt.

### French Imports and Exports.

The exports of bicycles and motor vehicles from France during the period from January 1 to November 1, 1898, amounted to \$1,977,920, against importations during the same time amounting to \$1,626,800.

The negotiation in one state of sales of goods in another state for the purpose of their introduction in the former state is interstate commerce, and they are not liable to a license tax in the state where sold.

# SUBJECTS OF GENERAL INTEREST

**SMALL VALUE OF OUR PARCELS POST**

Our present parcels post system is of comparatively small value, and the limited extent to which it is used affords no basis upon which to judge of the volume of foreign trade which could be developed with proper facilities of this character. Our present parcels post conventions, fifteen in number, embrace Central and South American countries and points in the West Indies which are of minor commercial importance, with the exception of Mexico, and in several instances the limitations of the service are such as to lessen its utility to a great degree.

We are making but very little progress in the extension of this system. A treaty with Chili has recently been negotiated and now awaits ratification by the congress of that country. A treaty of similar character with Venezuela is in course of negotiation, with fair prospect of successful result. But so far as is known to the general public no effort is being made to provide such facilities for transacting a small parcel business with the European countries, the English colonies and other important markets. Beside the European manufacturer, who can dispatch small packages of merchandise quickly, cheaply and safely to many of the more important markets, we are sadly handicapped in our efforts to develop foreign trade.

There is no evidence that the postal authorities of the United States are disposed to undertake the extension of the parcels post system except at the instigation of the business interests of the country, and the lack of a well-defined and strongly-supported demand is one of the chief causes why the system of foreign parcels post has not been extended to more important countries.

**MEMBERSHIP OF TRADES UNIONS**

The report of the Commissioner of Labor Statistics estimates that the proportion of all the working people in the

state of New York who are organized is at present not far from 10 per cent. This is evidently as favorable a showing as can be made.

The commissioner says there are no statistics giving the total number of persons in the state who could be classed as wage workers, but making an estimate from the statistics of occupations in the state in the eleventh census of the United States, and allowing for the increase of population since 1890, he concludes that 10 per cent of the workers are organized. The percentage is too high. If in eight years the population has increased 13 per cent—and in the preceding decade it increased 18 per cent—and if 40 per cent of the entire population is engaged in gainful occupations, which was the percentage in 1890, and this percentage has a tendency to increase, then the number of persons who are earning their living in the state is 2,711,000. The highest membership of labor organizations reported, just under 180,000, is 6.6 per cent of this. This is the number reported in the first quarter of 1898; by the last quarter the number had fallen to 171,067, which is only 6.3 per cent of the probable number of workers in the state.

But the number of members of labor organizations is extremely variable. On the last day of the first quarter of 1897 it is reported to have been 142,570. A year later it had increased 47,000, and during 1898 it fell off 9,000. What may be called the permanent organized labor, the workers who really keep up the organizations, who stay by them, and do not simply join

when there is a boom in business and the demand for labor is above the average, are perhaps about 5 per cent of all the persons who are working for their living. For the country at large the percentage is undoubtedly smaller than it is in this largely industrial state.

**NICARAGUA CANAL CONSTRUCTION**

Interest in the construction of a Nicaraguan canal has been stimulated powerfully by the incidents of the late war with

Spain and by the commercial expansion of the United States which has resulted from the brief conflict. Arguments heretofore advanced in behalf of the various interoceanic canal projects have been more essentially of a commercial character; but while the importance of a canal from a purely mercantile standpoint has in no way diminished, the political and strategic value of a waterway across the Central American isthmus has been increased enormously during the past few months.

We have heard much of the importance of a shorter route from the Pacific coast to the Atlantic seaboard based upon the theoretical necessities of a possible war, but when our magnificent "Oregon" steamed from San Francisco to Key West last spring, traversing a distance of over 15,000 miles in an actual sailing time of fifty-nine days, then it became clear to every mind not hopelessly obscured by preconceived opinions how immeasurably important would have been a channel of communication between the two oceans capable of saving one-half of this time and avoiding the constant danger of destruction by a hidden foe in South American waters. Experience has added to theory an argument which cannot be overthrown.

The whole tendency of the Nicaragua canal agitation of late has been more and more strongly in the direction of the United States, and in fact under the actual ownership of our nation. In the minds of the people this subject is becoming more and more a public enterprise in which private interests are figuring only in the promotion and preliminary work.

The commission created under the act of June 4, 1897, for the purpose of investigating and considering the entire field of canal possibilities in Nicaragua has finished its field work during the past year, and the results of its labors will give to this government a more accurate and complete basis upon which to consider legislation touching this project. The preliminary report of this commission roughly figures the cost of constructing a canal upon either of the two best known routes at about \$125,000,000, this estimate providing for a waterway of larger dimensions and greater capacity than any heretofore proposed.

**DEPARTMENT OF COMMERCE**

While the interest in the proposed Department of Commerce and Industries has not diminished in any degree during the past year, yet little substantial progress can be reported as compared with the situation of one year ago. The bills that have been pending are still before the committees of the House and Senate.

The consideration of the various problems involved in the war with Spain has so far occupied the attention of Congress as practically to exclude many very important matters upon which action has been greatly desired, and among these few are of more consequence than the

proposed Department of Commerce and Industries. The conditions have not been favorable to any active or very aggressive work in this line. It is believed that in the incoming Congress there will be a larger sentiment favorably disposed towards such action than has existed in the present body. The continual expansion of our foreign trade and the certainty of still greater development in the same direction add constantly to the arguments in behalf of this new federal department.

**TELEPHONES OF THE WORLD**

Below are given some interesting statistics in regard to the telephones in use in the different countries in the world. On

the score of number of machines in operation and distance covered, this country leads all others, Germany being second, Great Britain third and Sweden fourth. Canada makes a poor showing. Australia is worst of all, its civilized condition considered:

	Instruments in use.	Distance covered.
	Number.	Miles.
Sweden (1897) ..	56,500	74,568
Norway (1897) ..	20,678	33,481
Denmark (1895) ..	10,500	9,321
Finland (1895) ..	7,351	13,049
Great Britain-Ireland (1894) ..	69,645	83,401
Holland ..	8,000	4,971

**RESULT OF ENGINEER'S STRIKE**

The reaction of the so-called great but very short-sighted engineering strike in Great Britain is coming about in a way

that was not anticipated by the strikers. That it drove away trade was not a surprise to such as could see beyond the end of their noses, but that it should bring about a gigantic combination of capital against trades-unionism was not among the hatchings expected of a cockatrice egg. It may be an unwise movement on one side as it was on the other, and it, too, may have an unexpected reaction, but the fact remains that a colossal federation of employers has been formed with the declared intention of running their own business without the dictation of British trade unions. About 300 firms are represented and the capital at the command of the federation runs up into the millions.

Joseph McCluskey, of McCluskey & Pugh, bicycle dealers in Terre Haute, Ind., has sold his interest in the business to W. C. Rottman.

The prospect for a starting up of the Greyhound bicycle factory in East Brookfield, Mass., is brighter than it has been.

GARFORD

HUNT

BROWN

## Guarantees

**W**E imagine that the average dealer gets awfully tired of having to bolster up little-known goods with a guarantee. He must labor to convince that they are safe to buy; that no risk is run because "money will be refunded if not satisfied," etc., etc.

How much better to handle goods that need no long-winded, brain-cudgelling argument to sell, above all, goods that don't have to be lied about; in other words Garford-made goods that sell themselves.

All we ask is that dealers will *tell the truth* about our saddles—if they can find anyone who does not already know about them.

## RECENT PATENTS

## Inventors Directing Attention Toward Chainless Driving Gear—Novel Sprocket Movement

**Spiral Gear Mechanism.**—The application of spiral gears and pinions is effected in this invention by placing the spiral driving gear in the same position as that occupied by the front sprocket in an ordinary chain driven machine. Brackets depending from the crank hanger and the right rear fork end support, on ball bearings, a tubular spindle on the ends of which are mounted spiral pinions, engaging respectively the driving gear in front and the spiral gear on the rear hub of the machine. A stationary rod inside of the hollow spindle clamps the two pinion-supporting brackets together and braces the construction. An obvious advantage of this form of driving gear over other patterns of chainless gears is that the driving pinion at the rear hub and its casing do not extend laterally outside of the rear end lug of the frame. The invention's principal claim for the mechanism is that the teeth of the gears, which are all pitched to the same angle and in the same direction and are practically short sections of screw-threads of quick pitch, will properly mesh with

each other though the gears and pinions be thrown out of their normal alignment. The friction involved in the use of spiral gears is principally due to the great amount of end thrust on the pinions, says the inventor, and attempts to demonstrate that in his construction the thrusts are made to neutralize each other in such a manner that specially strong frame construction is made unnecessary. Nothing is claimed for special contact surfaces of the gear cams or means for cutting them, but it seems to be the intention that the pinions shall be so generated as to avoid all sliding friction between the pinions, leaving the end thrusts to be absorbed in the ball-bearings. The inventor is M. C. Johnson, Hartford, Conn.

**Combination Bevel Gear Mechanism.**—The mechanism provides an up and down pedal movement in which the stroke of the lever cranks is adjustable while riding. The cranks stand normally vertical on the ends of the shaft and are bent so that the movement of the pedals may be approximately vertical instead of in an oblique path. Between the shaft and the bend in the crank a hinge connection is made with a hollow thrust shaft which incloses in a slidable manner a spirally grooved solid shaft connected at its rear extremity with a bevel gear meshing with a bevel pinion on the rear wheel hub. One or more balls are recessed in the hollow shaft in such positions that they may roll in the spiral grooves in the inclosed shaft, the movement of which is

limited by the balls coming in contact with the respective ends of the spiral grooving. The bevel gears operate on ratchet devices so that when the pedal is pressed downward and the hollow thrust

rod moved forward accordingly, the balls will turn the spirally grooved shaft and drive the bevel gears in the direction suitable for the driving of the bicycle. The upward return movement of the pedal, which is accomplished by the aid of a spring, has no effect upon the running of the machine, the gears sliding on their ratchets. The mechanism is alike on both sides of the machine. The fulcrum box connecting the hollow thrust shaft with the pedal lever arm is arranged on the latch principle, so that by pressing with the foot on a small operating latch-piece the fulcrum may be raised or lowered on the lever and the stroke of the pedal thus correspondingly shortened or lengthened. The inventor of the device made his original patent application on a bicycle which, besides the driving gear, embraced such questionable advantages as screwed-together frame parts, hub shells in two pieces and wheel rims and tires also made in two parts and fastened together by quick action hand latches. The wheel hubs are hung in the frame on vertical spring cushioned rods of an old and abandoned type. The inventor is W. O. Campbell, of Sulphur Springs, Ark.

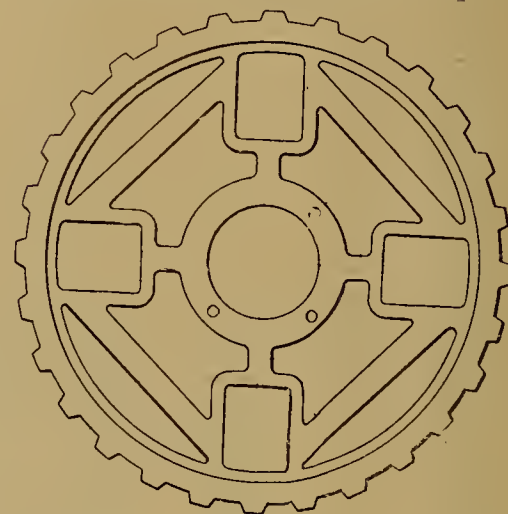

**Cam Acting Sprocket.**—The front sprocket instead of being mounted on the crank axle revolves on a row of balls

in a periphery race in a disk fastened to the crank bracket but eccentrically arranged to the axle. The shaft carries a ring which is of smaller diameter than the sprocket and which has on its inner face near the circumference a series of—say, six—roller-studs. These rollers travel

in an equal number of semi-circular cam ways cut around the inner circumference of the sprocket rim. The same system of sprocket mounting and driving is applied to the rear wheel, the roller studded wheel, which here carries the sprocket teeth, being revolvably mounted in the frame and the cam rimmed ring being secured to the rear hub. The inventor's claim for this construction is that the diameter of the front sprocket can be considerably increased without lessening the ratio between crank length and sprocket radius as the power is applied near the rim of the sprocket. It is supposed that the friction in the driving chain joints will be thus greatly lessened. In reality the result of this arrangement The inventor is Georg Hess, Nuremberg, Germany.

**Front Sprocket Design.**—The main features of the design are the central ring which fits over the sprocket hub, the four short radial arms with rectangular extensions which reach to the sprocket rim, and the straight bars connecting these rectangles. The general effect of the spokes and extensions is that of a

Maltese cross. The design patentee is Fred Patee, Peoria, Ill.

## Age of the Pneumatic Tire.

The tenth birthday of the pneumatic tire occurs this year. The pneumatic was first used at a race meeting held at Belfast, Ireland, in May, 1889. A pair of one and one-half inch "rag" tires fitted to flat wood rims were made after considerable difficulty. On the machine thus equipped, which weighed 36 pounds, W. Hums started from near the limit position in two handicap races and won both with great ease, no one being within 100 yards of him at the finish. Soon after the market was flooded with orders for pneumatic tires.

## Bullis Gear Company Incorporates.

The Bullis Ball Gear Company, of Rochester, N. Y., has filed articles of incorporation with capital stock of \$75,000, divided into 750 shares, for the purpose of manufacturing and selling the Bullis ball bearing gear for bicycles and also bicycle sundries. The company begins business with \$60,000 paid up capital. The directors are: F. O. Bullis, A. J. Fish, T. J. Swanton, S. A. Service and Horace McGuire, Jr., all of Rochester.

## Duthie Factory Damaged by Fire.

The room in the Duthie Chain Company's factory in Indianapolis, which was used for dressing bicycle chains, was completely destroyed last month by fire, which originated in the furnace room of the building. Many finished chains were rusted from the water used in putting out the fire, so that the total loss to the company is estimated at \$5,000, fully covered by insurance.

## NEW MOTOR VEHICLE PATENTS INDUSTRY AHEAD OF EXAMINERS

### Claims Allowed on Frame Construction, Variable Speed Friction Gearing and Double Cranked Shafts.

Since the earliest motor vehicle patents, up to July 1898, were published in this paper, the motor vehicle industry has made great bounds toward the solution of the practical problems connected with its development, and it has become generally recognized that the most important improvements are being quickly embodied in actual commercial construction before the knowledge of such construction can possibly be obtained through the Patent Office.

In many cases improvements of the greatest value are not patentable, and in other cases the protection afforded by the patents is doubtful. As an index of progress the list of patents has therefore lost most of its value. Until conditions change, the most valuable information for motor vehicle constructors and the public must be obtained through analysis of vehicles which are actually built, and the patents serve chiefly the purpose of recalling to mind the various expedients which may be employed for overcoming minor difficulties and suggesting new combinations which it may be profitable to have at one's finger ends when considering new construction of any kind.

#### Later Developments Hold Attention.

To the public at large the radical innovations such as the successful application of steam or condensed air, are of the highest significance, dwarfing by comparison the minor points covered by patents. Constructors and patent attorneys, on the other hand, will, as a rule, require the complete specifications in order to determine to their own satisfaction whether contemplated construction will infringe on patents already issued or applied for.

In this and subsequent issues of this paper motor vehicle patents will for these reasons be treated with great brevity, the

list and illustrations serving mainly the purpose of suggesting to the reader whether or not it will be advisable for him to obtain more detailed information by procuring copies of the patent documents for special examination.

#### Haynes-Apperson Speed Change.

No. 607, 116. July 12, 1898. Elwood Haynes and Elmer Apperson, Kokomo, Ind. Motor vehicle.

This patent carries claims relating to details of frame construction, and claims on details of the variable travel pawl, which constitutes the speed change of the Haynes and Apperson motorcycle.

The crank J on the end of the engine shaft drives the rod V1, which in turn drives the slotted arm V, pivoted as shown and carrying the sliding block V1, which carries the rods N, N1, which operate two vibrating arms provided with friction dogs adapted to grasp and variably rotate the disk K, all in a well-known manner. The block V1 is moved by a hand operated screw, V3, to vary the travel of the arms L, L1, and thus vary the speed of the vehicle, the speed of the explosion motor which drives the wagon remaining constant. Thirteen claims.

No. 607,308. July 14, 1898. Leigh Watkins, Denver, Col. Wagon steering and driving mechanism. This patent covers

a curious arrangement of linked bevel gearing and segments. It carries twelve claims on detail construction.

No. 607, 318. July 12, 1898. William O. Worth, Chicago, Ill. Motor vehicle.

Worth employs a pair of explosion engine cylinders working on one shaft with cranks at 180 deg., and on the end of this shaft places a friction disk, operating radially adjustable friction pinions so as to produce a variable speed gear, all in a manner many times before shown. Nine claims.

#### Lewis' Improved Variable Gear.

No. 609, 443. August 23, 1898. George W. Lewis, Chicago, Ill. Vehicle motor.

In this patent Lewis covers some improvements in his former traversing friction pinion variable speed gear, by placing the friction pinion on a first counter shaft, and thus transferring motion from the first counter shaft to a second counter shaft by means of toothed gears, and from the second counter shaft to the driving wheels by means of sprockets and chains, apparently with a view to using a very high surface speed on his friction pinion, which is undoubtedly correct. Two claims, minutely detailed.

No. 609, 811. August 30, 1898. Charles M. Johnson, New York, N. Y. Motor vehicle.

Johnson shows a pair of explosion cylinders working on cranks 180 deg. apart on the same shaft in connection with a double train of gearing, one high speed, one low speed, leading through various clutches to the rear axle. In one of his claims Johnson specifies a 3-crank shaft instead of the ordinary 2-crank shaft for his cylinders to operate upon, and appears to think himself the first to work two pistons opposite each other on cranks set at 180 deg. to each other.

Peter Tierney, of Bay City, Mich., who has one of the largest and best equipped retail stores to be found in that state, has opened a large retail store at 207 Genesee avenue, Saginaw, Mich. His jobbing business will be handled entirely from the Bay City store.

## HEAT IN DRIVE WHEEL RIMS OBSERVED ON MOTOR VEHICLES

### Peculiar Fact Which May Explain Creeping of Rear Tires on Pacemaking Machines.

A curious phenomenon in connection with motor vehicle driving is noted by Gilbert J. Loomis, a cycle dealer of Westfield, Mass., who owns a gas engine driven carriage. He states that the steel rims of the rear wheels always get heated above the temperature of the atmosphere when he is driving the carriage, while the front wheel rims never get warmer by driving than they otherwise would be.

Desirous of an explanation, he furnishes the following data: "The carriage I have is driven by a four horse power gasoline motor with two cylinders. The rear hubs never get warm, neither do any of the bearings, although I have run it fifty miles without stopping. The spokes are not wire spokes and do not get warm. The bearings are four rows of balls, two on each side in the rear shaft. The carriage weighs 1,400 pounds and about two-thirds of this load is on the rear wheels. The rims are steel rims, and seem to get warm, but never beyond a certain degree, while the front rims never get warm. I simply asked the question in regard to the cause from knowing the complaint of tires creeping on multicycles. It seems a very peculiar thing, though it gives no trouble."

#### The Flexion Transformed to Heat.

The carriage is rear-driven, and the resistance against propulsion is therefore mainly sustained by the rear wheels at their points of contact with the ground. The tires are pneumatic, and the strain of the rubber and fabric in them must be considerable, and must find its expression in successive compressions and relaxations of the tire material as the wheels revolve. In accordance with the usual rule that lost motion is transformed into heat under such circumstances, it seems likely that this heat will be liberated along the "lines of the smallest resistance," and will be communicated to the steel rims, from which it will then disappear gradually by radiation.

#### Heat Absorbed by Expanding Air.

With a low degree of inflation of the tires, it might first take effect in the expansion of the air contained in them, but with the increasing resistance of the tire material to such action, the condition would soon be brought about when the escape through the rims would represent the smaller resistance.

In the front wheels, which are idlers in a rear driven machine, the resistance to motion at the points of ground contact is so much reduced, partly because the load on them is only half of the load on the rear wheel and still more because they do not sustain any of the stresses arising from atmospheric resistance and engine friction, that the same results could not be expected.

#### Wood Rims the Cause.

The reference made by Mr. Loomis to tires on multicycles, which so frequently show an inclination to creep, assumes an interesting aspect if the above, popularly worded, explanation of the motor vehicle phenomenon, may be accepted as essentially correct. The heavy work sustained by the single rear wheel tire when a quint or sext is driven at racing speed and the lost internal motion in the tire has no chance to escape through a steel rim, which is a good conductor of heat, would apparently be most likely to take effect on the cement by which the tire is fastened, softening it and thereby bringing about the condition which leads to

creeping of the tire and accidents and delays in the racing.

The employment of steel rims for the rear wheels of multiple machines would seem to be the most obvious remedy, unless mechanical fastening of the tire should be preferred, and in this connection it would be of interest to know if the troubles which have been experienced in this country with creeping tires have also been observed in Europe with pace-making machines on which steel rims are used.

**PERMIT FOR MOTOR CAB LINE**

**District of Columbia Commissioners Doubtful About Granting License to Proposed Service.**

Washington, Jan. 30.—The District commissioners have under consideration a proposition made by E. T. Semans of this city to establish in Washington regular lines of oil motor carriages or cars for public passenger traffic, to be run over the streets of the city and collect fares not exceeding the rates now charged by the local street railways. The projector of this scheme also proposes to establish for general use motor vehicles to be used in urban and suburban service. It is said that the motor cars will be especially built for this purpose, and will be capable of carrying fourteen passengers each. They will be provided with 2½-inch solid rubber tires and with oil motors manufactured by the Daimler Motor Co., Limited, of London, England.

Mr. Semans has assured the commissioners that these cars will be noiseless and odorless and that they will be provided with all modern appliances for safety and convenience. The projector claims that the speed of both the larger and smaller motors will be under perfect control, and while they will be capable of a much higher rate of speed, they can be positively regulated so as not to exceed the regulation limit of twelve miles an hour.

The question has arisen whether it would be necessary, under existing laws, for the promoter to secure a special permit or license for such public vehicles, other than the ordinary license prescribed. The commissioners have decided to lay the matter before the attorney for the district for his opinion before taking any action.

**Remarkable Automobile Speed Record.**

In a motor vehicle match race that took place at Acheres, a few miles from Paris, on January 18, the speed record for all kinds of machines except railroad locomotives was lowered. The distance covered was two kilometers (1¼ miles), and the time 1 minute 47.3-5 seconds, from a standing start. The contestants were W. C. Jenatzy, the challenger, and Count de Chasseloup-Loubat. Jenatzy made the first trial and lowered the existing motor vehicle record for two kilometers by seven seconds. Then de Chasseloup-Loubat made the attempt and reduced Jenatzy's time by fifteen seconds. At 200 meters from the finish the motor became overheated from the terrific speed, which was more than forty-three miles an hour. The count's vehicle was a double seater. Jenatzy's was a road vehicle of four seats, the same with which he has won previous races.

**Steam Omnibus Line for France.**

Steam motor cars are to replace horse locomotion in April in the omnibus service between Hyeres and Toulon in France. The omnibuses are to be mounted on rubber-tired wheels and will comprise first and second classes, capable of carrying twenty-eight passengers with luggage. The average speed will be twenty-two kilometers an hour. It is said that there will be almost complete absence of smoke, noise and vibration.

**ALCOHOL MOTORS IN FRANCE**

**EXHAUST ODOR NOT OFFENSIVE**

**Operation Differs from That of Gasoline Motors Only in the Form of Carburetor.**

The first motor vehicle driven by alcohol made its appearance in the streets of Paris January 11. It belonged to Mr. Henriod, a Swiss engineer, who had converted his former petroleum motors to the purpose. The only perceptible change in the vehicle that could be remarked was that no odor of gasoline was given off, but instead thereof the ordinary and more agreeable odor of alcohol—the kind that is sold all over Paris for 4 cents a liter.

**First Experiments With Alcohol.**

The first experiments with alcohol as a substitute for gasoline date back about two years. Those made by Mr. Ringelmann for a French agricultural society led to the result that alcohol could never compete economically with gasoline.

The German government is said to have given it into the hands of the Koerting company of Hanover to conduct a series of experiments with alcohol,

hol, the cost of which is to be defrayed by the German syndicate of alcohol manufacturers.

**Advantages of Alcohol.**

It is admitted that the calorific power of alcohol is inferior to that of gasoline and that the development of a given power should ordinarily be expected to require a larger and more cumbersome motor with alcohol than with the kerosene oils. The advocates of alcohol on the other hand contend that it is practicable to compress the alcoholic gas mixture nearly twice as much as the explosive mixture of gasoline vapors, and that the heat produced by combustion in the new motors is reduced to one-half, and that by doubling the length of the cylinder it should therefore be possible to obtain practically the same piston pressure from a given quantity of alcohol as from the same quantity of gasoline. The combustion with the longer stroke should be more perfect and the exhaust should take place at a pressure not exceeding that governing the admission of the gas to the cylinder.

**Henriod and Petreano Motors.**

The Henriod motor, according to press reports, has no carburetor, but delivers the alcohol in a fine spray in the valve chamber, where a current of heated air

vaporizes it without further mechanical arrangement.

The Petreano carburetor which is shown in the accompanying illustration consists principally of the metallic cylinder C, through the length of which passes the large tube c, which is the exhaust pipe. The latter keeps the temperature throughout the cylinder at a uniform heat. The tube c is surrounded by a wick of porous material.

The liquid alcohol enters at D and the air at A. The alcohol runs onto the distributors E, and from these falls to distributors e, which are coated with porous material similar to that surrounding the exhaust pipe. This material absorbs the liquid.

**Accurate Regulation of Feed.**

The air passes first from E to e, then rebounds and passes below through the holes o, facilitating vaporization by its whirling motion. The excess of liquid runs down through the holes i, falls on the distributors E1, and thence on e1. The gaseous mixture follows the same devious course and finally issues from the holes ol and penetrates through holes O into the interior chamber B, from which it is led through b to the valve chamber s of the motor.

The carburetor is arranged close to the motor. Any excess of liquid alcohol may be removed through the cock r, but it is found in practice to be easy to regulate the feed of alcohol so accurately that the bottom of the carburetor remains dry. The absence of foreign substances in the alcohol, as compared with gasoline, offers the advantage of freedom from residue and assurance of perfect evaporation.

**MOTOR OMNIBUSES FOR PEORIA**

**Citizens Are Forming a Company to Establish Suburban Lines of Twenty-Passenger Vehicles.**

A company of wealthy citizens is forming in Peoria, Ill., for the purpose of establishing a regular residence line of motor omnibuses for the residence portion of the city.

The vehicles will be built at the Duryea factory, especially for such traffic, and will carry passengers for the same price as charged by the street car company, with much superior accommodations, it is reported. The only bar in the way of the project is the chance of hostile legislation by the city council, a majority of which is dominated by the Illinois Central Railway company.

If this trouble arises, however, the promoters of the motor carriage line will wait until after the spring elections before asking for a license.

The buses are to be rubber-tired vehicles, carrying twenty passengers. They will run from the center of the city to all the suburbs.

**Outlet for Peoria Motor Vehicles.**

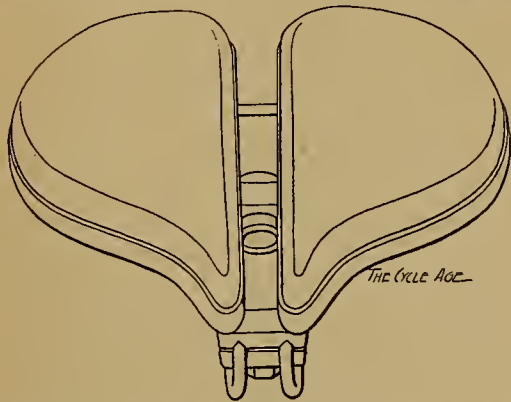

The bicycle factory property of Rouse, Hazard & Co., at Peoria Heights, Ill., has been transferred by Joseph Miller & Sons, contractors, who built the plant on mortgage, to Monroe Seiberling for \$20,000. The buildings are to be fitted up for the manufacture of the Duryea motor vehicles. An anonymous gentleman from New York is stated to have visited the town for the express purpose of looking over the site and examining into all that pertains to the production of the Peoria-made vehicles and to have offered to take the entire output of the Peoria Heights factory for the season that is now opening. Work is to begin as soon as machinery can be installed and other necessary arrangements made.

The Eaton Motor Carriage Company has been incorporated in Maine, by Boston men, to manufacture motor carriages. The authorized stock issue is \$500,000. Paul Askenasy and A. M. Sheehan are named as the incorporators.

# INFORMATION FOR BUYERS

## THE CHRISTY ADJUSTABLE SADDLE.

Many new friends will doubtless be gained for the Christy saddle through the introduction by A. G. Spalding & Bros. of Chicago and New York, of a new pattern which is adjustable. The saddle, shown in the illustration herewith, can be adjusted from the rear, making it very much wider, should the rider desire it, and at the same time retaining the normal width in front. The cups in which the cushions rest work on a pivot at the pommel. Heavy weight riders who desire a broad, comfortable seat and those who, after riding in one position

for some time, wish a slight change will especially appreciate the advantages of the new Christy. The Spalding Company exhibited alongside of its latest chainless models of bicycles at the recent cycle show the first bevel gear chainless of the modern type that was ever placed on exhibition. The machine was originally shown at the cycle shows in 1897 and has been in constant use ever since, having been ridden, it is stated, more than 36,000 miles altogether. Placed side by side with the most improved chainless Spaulding it furnishes an interesting illustration of the progress that has been made during the last two years in the design and construction of bevel gear machines.

## MOSSBERG TIRE ACTUATED BELL.

The illustration below shows the new tire bell recently brought out by the Frank Mossberg Co of Providence, R. I. The bell is placed directly in front of the steering head where it is out of the way and looks symmetrical on the machine. The rotating shaft is placed in a position radial to the center line of the bell, and this shaft with its friction wheel is caused to swing downward slightly to permit the wheel to come

in contact with the tire. The striking mechanism consists of a loose, freely sliding hammer. No spring is used in connection with the mechanism, the rotating shaft causing the hammer to strike the bell, and gravity, aided by rebound, causing the hammer to return to its normal position, when the rotating shaft will be ready to give it a new impulse. There being scarcely any resistance to the operation of the striking mechanism the shaft requires very little power and so the contact between the roller and the tire may be very light. It is claimed by the makers that owing to the absence of springs the bell will not wear out. It is guaranteed for one year.

The bell shown in the cut has a double stroke chime action. A single chime bell is also made on the same principle. It is

the intention of the company to bring out several other novelties in the line of bells and similar goods in the near future. The Coe Mfg. Co., 50 Warren street, New York City, is the sole selling agent for the Mossberg bell in the United States.

## METAL VALVE STEM INSERTER.

The Kelly Mfg. Co. of Greentown, Ind., which manufactures the Kelly rubber band tire repair tool, has arranged to make and market a tool for inserting metal valve stems into tires. The tool, which is illustrated herewith, is the invention of A. Whisler, and is doubtless the only form of such tool extant. Its utility will be readily appreciated by repairmen who have experienced the difficulty of inserting metal stems with the aid of pliers, screw drivers, etc., and have been often compelled to unduly enlarge the hole in the tire in order to get the stem in place.

The tool comprises a hollow casing having a stationary finger on one end and a pair of swinging fingers pivoted to the same end, the pivoted fingers being cut away upon their adjacent edges to allow the passage of the valve stem between them. As will be seen from the illustration, the stem is placed in the tool at right angles to the barrel with the head held between the sta-

tionary and the pivoted fingers. Each of the fingers is provided with an outwardly extending flange to catch on the under surface of the tire after the tool has been inserted through the valve hole. A plunger is arranged in the casing by means of which the valve head may be pushed down into the tire, the pivoted fingers spreading while this is being accomplished and closing again after the valve is through so that the tool may be withdrawn. With this tool, valve stems may be placed in the tire without the least difficulty and without enlarging the hole.

## THE ST. LOUIS GASOLINE MOTOR.

The gasoline motor shown in accompanying illustration is manufactured, either horizontal or upright, by the St. Louis Gasoline Motor Company at 115 South Eleventh street, St. Louis, Mo., and is of a construction which fits it especially for all who are experimenting with motor vehicles, being of light weight but absolutely safe and always ready for instant service. The two horse power motor weighs 89 pounds and occupies a space of 24 by 11 inches. One sight feed oil cup lubricates all bearings. Naturally, these features which make the motor available for motor vehicles, are of equally great value in the shop for driving lathes, drill presses, air blast, charging air tanks, etc. The cost of operating the two horse power motor is stated to be less than 1/2 cent per hour, and it requires practically no attendance while running. The ignition is electric. Some of the construction details are explained by the manufacturing company as follows: "The governing device works on a supply of air and gas so as never to shut the charge off entirely. All working parts run in oil. The mixture of air and gasoline

is maintained by an improved valve, which gives way to the suction caused by the movement of the piston on the admission stroke, and having only this single valve covering, the gas and air openings maintain the proper proportion at all times. Besides the throttle for governing the speed, a governor of special design is operated on the inlet valve and governs the supply of air and gas. The improved electric igniter is entirely automatic in its work, and is so constructed that, in case of wear, it can be adjusted in a few moments. It is also constructed so as to clean itself of corroding matter. If at any time it is necessary to examine it, it can be taken out and replaced in one minute. The crank shafts are forged of solid steel bars, and are without any weldings; the connecting rods are made of the best brass bronze.

The flywheel on the two horse-power motor is 17 inches in diameter, and is a suitable weight for the power of the motor. By means of a special circulating device the amount of water used in the cooling jacket is reduced to two common pailfuls for a full day's work." The company furnishes complete directions with every machine sold.

## THOMPSON'S NEW FORKSIDE STEMS.

The diamond shaped front and rear forks manufactured by the Geo. L. Thompson Mfg. Co. of Chicago are already familiar to the trade. A new fork of substantially triangular cross section with the base of the triangle on the inner or wheel side of the fork blade has been recently covered in a design patent allowed to G. L. Thompson. The flat side of the fork is given a slight convex curve. The appearance of the outside of the blade is similar to that of the diamond shaped fork.

## NEW FOLDING MUD GUARD.

J. B. Campbell, of 324 Dearborn street, Chicago, is bringing out a new mud guard, the general appearance of which is shown in the accompanying illustration. The guard possesses the notable advantage of being

extremely light and of presenting a neat appearance when on the bicycle. In fact, it is so small and light that even the most confirmed scorcher could not honestly refuse to use it on the ground of appearance. It comprises a narrow U of nicked spring wire bent at the outer end to conform to the section shape of the wheel tire. Thin metal plates hold a layer of rubber cut to conform to the outline of the tire. The free ends of the wire rod are attached to clips which clamp on the rear stays of the machine. By placing these clamps properly on the stays the guard frame may be turned on its frictional joints at the clamps so that the rubber shield almost touches the tire. All mud and water thrown up by the rear wheel will then be stopped at the shield and the rider's back protected. When not in use the guard

may be turned up on its hinges till it lies flat against the rear stays, where it will be hardly noticeable.

#### CHICAGO HANDLE BAR CO.'S GOODS.

In reporting the exhibits at the New York cycle show omission was made of the goods of the Chicago Handle Bar Company, which were displayed in the booth of the Manhattan Storage Company, which latter concern looks after the eastern interests of the big Chicago handle bar house. The new adjustable bar with patent internal expander, shown in the accompanying illustration, is the distinctive feature of the line of the Chicago Handle Bar Company. It will not turn in the head or become loose by jolting. The expander is operated entirely in the lower part of the stem, thus not interfering with the adjustment of the top bar. A one-third turn of the short eccentric bolt draws the expander rod and the tapered plug upward, producing an effective expansion of the lower slotted part of the stem and making the stem rigid in the steering head. A turn of the threaded clamping bolt tightens the stem securely around the ferrule of the top bar. The price of this bar with round top bar is \$5 and with the octagon top bar \$6, both without grips. Five other adjustable bar patterns are made at prices ranging from \$3.60 to \$5. Five patterns of down-turned bars are made at prices ranging from \$3 to \$3.20, five patterns of up-turned bars at prices ranging from \$3 to \$3.20, six patterns of ram's-horn bars at \$3.20, ten racing patterns at prices ranging from \$3.60 to \$4, and four patterns of Schinner bars at prices ranging from \$3.20 to \$4.

The firm also manufactures seat posts, reversible and plain; bent tubes for frames in women's machines, rear fork sides, bent handlebar tubes, adjustable stems for any style of top bar, seat post stems in the rough made of seamless tubing, handlebar stems for rigid bars made of seamless tubing, in-

ternal expanders for rigid bars, and the "Independent" external handlebar and seat post expander.

The Schinner patterns introduced by the firm last year continue to be extremely popular, owing to their beauty of outline and their particular adaptability to low frame bicycles.

#### POPE'S IMPROVED LIGHT MOTOR VEHICLES.

Hartford, Jan. 30.—The Pope Manufacturing company, which has the construction of several new models of motor carriages under consideration, will soon place upon the market a quadricycle with a gasoline motor. The vehicle is of light construction and is particularly trim in appearance. The smoke and objectionable odor of the gasoline, which are caused by partial combustion, have been practically done away with in this model. The company reports receiving many inquiries for the gasoline tricycle which was put on the market last fall and is being used for delivery purposes by department stores in the large eastern cities. In the latest models an improved form of electric igniter supersedes the hot tube and lamp, obviating the difficulty which was formerly occasionally experienced during a high wind.

#### READING STANDARD IN THREE GRADES.

The Reading Standard Mfg. Co. of Reading, Pa., is cataloguing three grades of machines each of which is built in men's and women's patterns. The Reading Standard, which is fitted with the company's new seat post clamp, the operation of which is shown in the accompanying illustration and which affords a positive and readily acting clamp, lists at \$50. The fork crown on these models is of tubular construction and special de-

sign and presents an entirely new feature, which while small in general purpose still adds to the utility and value of the machine. It comprises a flat nicked place left upon the front of the crown upon which the owner of the machine may have his name or initials engraved. The Reading Standard Roadster and the Royal Reading, selling respectively at \$40 and \$30, are fitted with flush nicked arch crowns and have features and equipment in keeping with the best possibilities in machines of their classes. Two-piece hangers are used on all of the models, though each grade of ma-

chine has a hanger slightly differing from the others and designed for its especial use. Options on all patterns are liberal and in keeping with the times and the demands of the market.

#### NEW FALCONS IN TWO GRADES.

The catalogue of H. C. Tillotson & Co. of Toledo, successors to the Yost Mfg. Co. in the manufacture of Falcon bicycles, bears reproductions of two union labels. One is that of the Allied Printing Trades Council, showing that the booklet was published in a union shop, and the other is of the Bicycle Workers' Union and is the same as that placed on all Falcon bicycles. The New Falcon bicycles illustrated in the catalogue are all made in the old Yost factory, in which special machinery and modern methods are enabling the operators to turn out machines in larger quantities than ever before. The New Falcon is made in two grades, one selling at \$45 and the other at \$35. The hanger used is of the two-piece construction with square cranks having beveled edges. The seat post is held by an internal expander and can be used with the horizontal saddle support either in front or behind the post. Kelly handle bars are fitted to the \$45 models. The higher priced patterns are enameled in black, maroon or Brewster green. The cheaper machines are finished in plain black. The fork crown is a single piece drop forging of semi-arch pattern.

#### EXCELSIOR GUARANTEED TIRES.

Special care has been taken in designing this tire to get the tread of such a character that will be serviceable and neat in appearance. It will be noticed in the drawing that the tread is plain and the sides corrugated, putting the rubber where it is most used. The tire is made from a high grade of rubber, and the duck used throughout is of the best. The tire is fully guaranteed for three months from date of sale by the Excelsior Supply Co., 98 Lake street, Chicago, for whom it is manufactured by the India

Rubber Co., of Akron. The company supplies a pump and repair kit with each pair of tires, and the price is such that it will interest close buyers for a guaranteed cheap tire which will be serviceable and give good satisfaction.

#### VALUABLE TREATISE ON FILES FREE.

"File Philosophy" is the subject of a dainty and at the same time very practical booklet just issued by the Nicholson File Co. of Providence, R. I. It treats briefly and yet comprehensively of the general classification

of files and definition of file terms, the proper methods of handling and using files so as to secure the best results, and gives a description of the most common files and the ordinary uses to which they are applied and for which they are best adapted. It thus covers all the points which most interest and concern file-users and will be found by them a readable and valuable book. It is really an abridgement of the Nicholson company's "Treatise on Files," which was published in 1878 and which has always been accepted by the craft and trade in general as the authority on all matters pertaining to files. It is in response to a continued demand for this treatise, now out of print, that the present "File Philosophy" is published. The matter is carefully compiled and edited, illustrated with helpful plates, and affords a valuable addition to the body of popular literature on scientific subjects. Moreover, its brevity and convenient size render it the more acceptable. It may be had upon application to the Nicholson company's main office in Providence.

#### THE NATIONAL CRANK HANGER.

The National Cycle Mfg. Co. of Bay City, Mich., is using a crank hanger on its National bicycles which is a development along the same line that the company has followed since 1894. The leading principle of the hanger is the "slip in" feature, the bearings being incased in a sleeve which can be removed from the bracket without disturbing the adjustment of the bearings. The company is the original patentee of this type of hanger. The cups are heavy and are ground inside and out after tempering, and being held in place in the sleeve which is accurately machined, it is impossible for them to be out of line. Another desirable feature of the hanger is the extraordinary

great distance between the two rows of balls. The cranks and axle are of the two-part construction, the right crank and the shaft being integral and the left crank being attached by means of a taper seat and end set screw.

#### MEILINK'S VIEWS ON EXPANDERS.

The Meilink Mfg. Co. of Toledo, which is one of the pioneers in the making of seat post and handle bar expanders, has had many inquiries from dealers and jobbers on the subject of what points should be most considered in the making of successful expanders. In order to give such parties and all others interested in the matter the benefit of its manufacturing experience, the company has compiled the following list of what it considers the six most important points: 1.—The expander should be independent of the frame so that no abuse on the part of the rider or repairman will result in injury to the frame through the improper replacement of the expander after removal. 2.—It must bind positively by its own action and draw apart in the same way. Otherwise when it becomes rusty, as it is very likely to do, the repairman's first remedy is very liable to be the hammer and cold chisel. 3.—The binding surface of the expander should be as small as possible. The greater the binding surface the more force it takes to tighten the expander. 4.—An expander in which each sleeve can be set independently of the other may be made to overcome many variations in the diameters of both seat post and frame lug. 5.—The greater the thread surface in the expander the greater are the binding possibilities and the insurance against abuse by inexperienced persons. 6.—That it may hold properly and securely the expander should clamp the seat post or handle bar around

### National Cycle Mfg. Co.

Bay City, Mich.

A NATIONAL RIDER NEVER CHANGES HIS MOUNT.

## Plain Talks on Andrae Cycles

VII—Road Racer, \$60.

The Andrae Road Racer is built a little heavier than the Track Racer because it ought to be.

A rider can cover more ground, any kind, on the Andrae than on any other wheel.

There is no power lost—every bit of exertion counts—there isn't any weak spot, any useless friction to counteract energy.

A 51-year-old rider won the Chicago Road Race two years ago because he rode an Andrae—not because he chewed a plug of tobacco every day.

Mr. Smedley said so himself.

The Andrae Road Racer is better to-day than it was then. As much better as two years of Andrae mechanical skill can show up.

Every cyclist who is determined to be fast on the road will buy it. Every wheelman who wants an easy running wheel will do the same.

The Andrae Road Racer and 15 other models are all good sellers.

Want to sell them?

INDIANAPOLIS, IND.

its entire periphery. Devices which clamp only two points will bind the post against vertical but not against lateral movement, and if forced to clamp tightly will compress even 16-gauge tubing.

#### HUGE WESTERN BUSINESS IN TUBING.

Herman Boker & Co. of New York have placed more than 3,000,000 feet of tubing through the eastern and western offices, the latter being under the direction of F. A. Hastings & Co., at 159 Lake street, Chicago. The tubing carried is for the most part imported, the brand being Mannesmann, of German manufacture. Mr. Hastings stated last week that the demand was such as to make it necessary to have carload lots shipped direct to Chicago in bond, and deliveries made direct from car to factory. In this way double handling is obviated and the rate per foot is kept down. The price of the tube is such as to command trade, especially where purchasers cannot buy in large lots, yet proportionate advantages are afforded those whose capacity is such as to warrant them buying in large quantities. Besides tubing of foreign manufacture the company handles the product of the Ellwood Ivins Tube Company, Philadelphia.

A feature of the business of the western office is a line of handlebars made up of tapered tubing, the bars being one inch at the stem connection and seven-eighths of an inch at the ends. A complete line of grips, hubs, pedals, Stockton and Baldwin chains, rims, guards, etc., is carried by Hastings & Co., all being of high quality and latest design.

#### NEW STEEL BALL MAKING CO.

The Cleveland Ball & Screw Co., 446 The Arcade, Cleveland, O., is a recently organized firm of which Leo Mayer is president and G. J. Bailey, secretary and treasurer. The parties in charge are men of ability and years of experience in the ball-making industry, and all the workmen are thorough and capable mechanics.

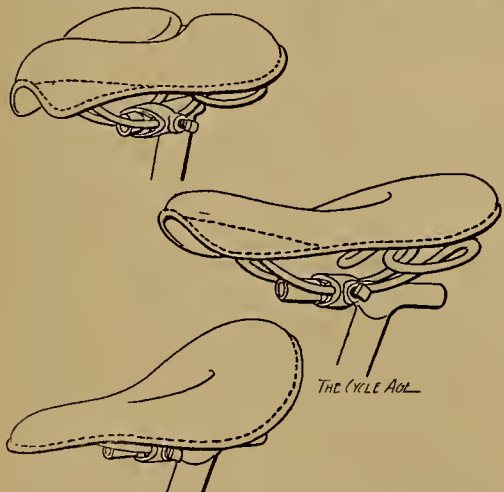

In announcing to the trade and public that it owns and controls valuable patents on machinery and methods for producing steel balls of all sizes from 1-16 inch to 4 inches diameter, and also patents on special automatic screw machinery, this company desires to call attention to the fact that it is putting same into practical use and will be in position very shortly to fill orders for strictly high-grade tool steel balls, properly hardened and tempered, accurate and uniform in size, carefully inspected and gauged, and at prices that will be interesting, considering the superior quality and finish of the product. The methods of manufacture are far advanced toward perfection, and the accuracy, uniformity, strength and finish of the tool steel balls are in the same degree superior.

This encouraging fact has led to the organization of the above new company with ample capital.

The company will not confine its production to tool steel balls alone, but will manufacture to order balls of such other material as customers may desire, as brass, bell-metal, clay, composition, etc., and will also make automatic screw machines of its own design and under its own patents; also all kinds of automatic machinery to order, as well as screw machine products.

#### NEW PATTERNS OF HUNT SADDLES.

While several of the saddle patterns which have proven popular in the past are still

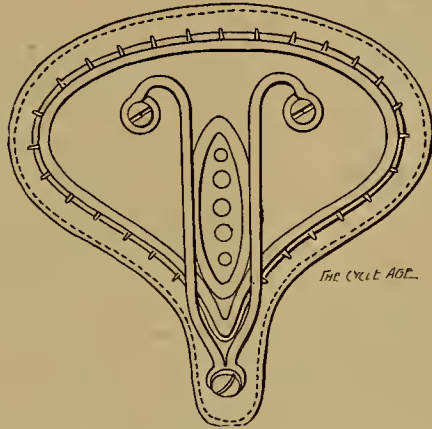

carried with slight improvements in the new line of saddles made by the Hunt Mfg. Co. of Westboro, Mass., several different forms have been added which possess distinctive features. Styles 76 and 77 are said by the Hunt people to be the handsomest models they have ever produced. The padding is very thick and is composed of interlaced hair. The wood base is on approved lines and affords beauty of outline as well as comfort to the rider. The spring has an easy riding coil at the rear. Model 77 is shown in the uppermost illustration here-

with. Models 52 and 53 are wood base patterns nicely padded and furnished with easy coil springs. The base is finished in natural wood giving unique and striking appearance. The second illustration shows model 53.

Patterns 50 and 51, the former of which is shown in the third illustration, have a novel method of fastening the leather cover to the nickel plated base. This is effected by clinched prongs that hold the leather securely, and with the depressed border around the edge of the base, produce a very neat effect when viewed from underneath. The bottom of this saddle is shown in the last illustration.

Patterns resembling 76 and 77 are also furnished but are not so thickly padded nor supplied with the same coil spring. The Hunt company is also furnishing a line

of spiral springs which may be applied to either its hygienic or rigid base patterns when it is desired to obtain a more comfortable seat than is afforded by stiffer springs. The well known "S" spring will still be supplied on hygienic patterns if desired.

#### ARTISTIC KEATING CATALOGUE.

The catalogue of the Keating Wheel Co. of Middletown, Conn., has an artistic cover with relief effect and shows one rider pointing out to another the advantages of the curved seat mast which has long been a distinguishing feature of Keating bicycles. The new Keating factory, a picture of which is shown on the back cover of the catalogue, is of a kind which is becoming popular among manufacturers in localities where plenty of ground space is available. It is but two floors in height and being long and narrow with several projecting eaves, each of which is devoted to some special operation in the manufacture of the product, it furnishes ample floor space and is devoid of such nuisances as darkness and poor ventilation. All of the machine work is done on the ground floor, and the brazing, blacksmithing, grinding, polishing, etc., are entirely separated from the main building. The Keating company is making a specialty of repairing in its own factory with view to giving better satisfaction than is common to agents and riders who return defective and injured parts.

#### THE EWALD ONE-PIECE HANGER.

The Ewald Mfg. Co., 215 S. Clinton street, Chicago, is now making its one-piece hanger in several patterns for use in different styles of machines. For single machines the hanger is furnished with regular and with eccentric barrels and choice of connecting lugs for different sizes of frame tubes is offered. The eccentric bracket is also put out with shells and sprockets arranged for tandem driving. In this hanger the inside sprocket is placed close to the tandem frame and hangs between the bearings. With the Ewald combination three and four-point bearing it is possible to have the axis of rotation of the balls perpendicular to the spindle and also to have each end of the bearing independent and with separate adjustment. Lately a new single star sprocket design presenting a very light and tasty appearance has been brought out by the company.

#### LARGE LINE OF ANDRAES.

While filling up its line to an unlucky number, the Julius Andrae & Sons Co of Milwaukee has no need to fear that the thirteen patterns which it lists in its advance circular will prove unlucky machines, for all present the same careful design and construction which have made Andrae cycles popular among all kinds of riders. The line includes the standard models of men's and women's road machines, listing at \$50; a chainless fitted with the Sager roller pin gear at \$75; a 30-inch wheeled machine at \$55; racer and road racer at \$60 each; single and double steering double diamond tandems and a combination tandem at \$85 each; men's and women's roadsters at \$40 each, and two patterns of the Andrae Sunbeam at \$30 each. The machines are fitted with various patterns of the Andrae padded sad-

dle and on some models the Hollenbeck rawhide saddle is offered as an option. Unguaranteed Clipper tires are used on the \$30 patterns and on the other machines Defender, Morgan & Wright, Hartford, Goodrich, Palmer and Andrae tires. The standard color is Andrae pea green.

#### W. & E. CYCLE MATERIAL.

The Walker & Ehrman Mfg. Co., Washington and Union streets, Chicago, which has always been known as a firm of careful, conservative manufacturers of high grade bicycle parts, has issued a complete catalogue of the goods it now makes and markets. Two grades of single machine hubs are made by the W. & E. company. The higher priced hub, the W. & E. Special, adjusts by means of the cups which screw into the barrel but are not inverted as in the ordinary disk adjusting hub. The adjustment locking device is positive in its action and does not depend for its security upon the binding power of nuts, which may loosen. Frame parts, already machined, for single bicycles and for multiplets, are furnished both in drop forgings and castings. Other important specialties in the line are the W. & E. expanders and pedals. The firm also sells the Fauber hanger and furnishes its frame fittings in angles to match those on the Fauber bracket. As well as selling the various frame parts, complete frame sets already fitted and ready to be built up are supplied at figures a little less than those which the separate buying of the parts would foot up to in the end. The frame sets include besides the lugs and cut tubing and forks, hubs, hanger parts, seat post and handlebar expanders, head fittings and seat posts.

#### CROWN AND CYRUS CYCLES.

The John Lonn & Sons Co. of La Porte, Ind., shows in its catalogue several patterns each of Cyrus and Crown bicycles, ranging in price from \$30 to \$60. The cheaper Cyrus patterns have outside joints. The other machines have flush joints throughout and some of the Crown models have diamond shaped front and rear forks. Crown Model 33, which has 30-inch wheels, is fitted with a frame of the three-crown construction in which the diamond forks are nickel plated, giving a striking contrast to the enameled portions. A men's and a women's cushion frame are included in the line, and tandems with either double diamond or combination frames will be built to order when the factory is not too busy on single machines. Cyrus models have the Thompson two-piece hanger, while the Crown patterns are fitted with the Fauber hanger. The options throughout are generous and where certain fittings not included in the regular list are wanted slight additional charges are asked, thus making it possible for the buyer to be supplied with almost anything desired without the company having to furnish at its own expense more than its regular wide list of options.

#### SPALDING FINISH DESIGN PATENTED.

Lewis T. Smith has been granted a design patent on an enamel finish, the patent being assigned to the Lamb Mfg. Co. of Chicopee Falls, Mass. The design implies the use of a bicycle steering head enameled in a color different from the frame, and provides for this second color extending out upon the frame tubes and terminating on each tube in a series of long sharply acute

points. The form of the two-color enameling covered in the design is shown in the accompanying illustration.

#### THE COLUMBIA CATALOGUE.

In point of letter press and artistic embellishment the catalogue of the Pope Mfg. Co. of Hartford, Conn., is in full keeping with the company's previous publications. The cover presents in unique color effect a Venetian scroll design. The interior embellishment comprises tinted half-tones showing the models and carefully drawn etch-

## A MOWING MACHINE...

costs more than a scythe—but it cuts more hay.

A fine tire costs more than a cheap - but it rides faster and farther. What made the solid tire give way to the cushion—the cushion to the pneumatic? For precisely the same reason the slow pneumatic is bound to give way to the fast.

Nobody wants slow tires; nobody buys them knowingly. And it isn't good, sound business to let people do it unknowingly. If you don't tell them, somebody else will, and they get the impression that they've been cheated.

League Tires need no explanation. Nothing goes into them but the finest rubber and fabric; nothing comes out but speed and staying qualities. "Get there and get back" tires look well in the store, ride well out of the store and, present or absent, are working steadily in somebody's interest—yours, if you handle them.

### LEAGUEKIT

mends any single tube tire. Quick and sure cement repair for small punctures, quick and sure plug repair for large ones. Only tool that does the work of two kits at price of one. Write for prices.

ST. LOUIS OFFICE:  
621 Holland Bldg.

ings illustrating the details of construction in Columbia and Hartford bicycles. The Columbia chainless, which of course occupies the position of honor in the book, is recommended indiscriminately to all riders by the company as an ideal mount. One of the prominent features of the catalogue is the double page illustration showing the factories of the Pope Mfg. Co.

#### CHICAGO TUBE CO.'S LINE.

The Chicago Tube Co., 217 Washington street, Chicago, is cataloguing frame sets, frames, complete and stripped bicycles and all kinds of builders' material, sundries and tools. Frame parts are offered for both outside and flush joints and for 28 and 30-inch wheels. Tandem frame sets of three styles are also included. Fauber hangers and the company's own two-piece hanger comprise the parts in this line handled. The line of small fittings, parts and such equipment sundries as saddles, pedals and handle bars is very large, including in each instance several lines of standard goods. The complete bicycles range in price from \$40 down to \$29, and include several styles of machines sold under the name Pirate. They are made from the fittings sold by the company and are staunch machines, finished and equipped in popular mode and offered to dealers at prices which allow comfortable profits to be made.

#### DROP FORGINGS THROUGHOUT.

The familiar 'claim of Iver Johnson's Arms & Cycle Works that it produces "Honest cycles at honest prices" is made the subject of the text in the company's catalogue. The construction of Iver Johnson cycles is carefully illustrated and described with the intention of demonstrating to the reader the care and skill used in the manufacture of the bicycles. Half tone illustrations from photographs show the connections and parts used and clearly bring out the extent to which the company carries out its policy of using nothing but drop forgings in the making of the parts. The new combination double plate and arch crown used on Iver Johnson machines is illustrated both in its finished form and as a rough drop forging before machining.

#### CLIPPERS GOING ABROAD.

Fifteen of the most improved pattern chainless Clipper bicycles made by the Grand Rapids Cycle Co., were shipped some days ago to Bombay, India, and may be ridden there before the spring weather here permits riding on the city streets. A short time ago a small shipment was made to Buenos Ayres, South America, but roads as yet in that country are undeveloped and cycling is not popular. Two Clippers are on their way to Johannesburg, South Africa, five were recently sent to St. Petersburg, Russia, and a dealer in Sweden has written to the company asking for prices on 5,000 of the chainless machines.

#### DUDLY TUBE CUTTERS ABROAD.

The Dudley Cycle Works, of Menominee, Mich., which make a line of cycle working tools, the leaders of which are the Dudley tube cutter and the Perfect nipple grip, are finding an appreciative market for their goods in Europe. Recently good sized orders have been received through four New York export houses for tube cutters and grips to be shipped abroad. The company also reports an excellent business in this country, its frame jigs and truing stands meeting with the same favor that has been granted the other devices.

#### NEW PERIODICAL FOR SPALDING AGENTS.

A. G. Spalding Bros., of New York and Chicago, have issued the first number of "The Spalding," in which they explain their new policy and make an earnest appeal for the support of the retail trade. An interesting feature is the synopsis of letters received from retail merchants in regard to the policy. The opinions of a great many merchants in all parts of the country are thus brought together, expressing almost unanimous approval of the new method, many of the writers commending it enthusiastically.

#### BARNES CATALOGUE WELL ILLUSTRATED.

Following its tasty little advance agent, the Barnes Cycle Co. of Syracuse has issued its regular catalogue. The brochure is the work of the Chasmar-Winchell Press, of New York city, and contains handsome half-tone cuts made from air brush drawings which display the White Flyer models and the constructive features in a most attractive and artistic manner. Taken as a whole, from cover to type composition, the catalogue is emblematic of the highest grade of the designer's and printer's art.

#### OLIVE CYCLES IN FIVE PATTERNS.

The Olive Wheel Co. of Syracuse, builds but one grade of machine and its carefully

written and neatly illustrated catalogue is devoted to the description of the models which comprise this one line. Great care has been taken in designing the models in order to not only obtain staunch machines but to give that grace of lines and neatness of construction which brands the product as first-grade. The standard road machines for men and women are respectively Models 32 and 33, and sell at \$50. The women's pattern is fitted with a celluloid chain guard completely covering the chain and offering absolute protection for skirts. The track racer, Model 34, has an extra low drop at

Model 35—30-inch wheels. Price \$60.

the hanger and is designed solely for racing purposes. It weighs complete 22 pounds and lists at \$60. Model 35, the 30-inch wheeled pattern, follows in general design the lines of the racer and also sells at \$60. The company offers in addition a chainless pattern fitted with the Sager roller pin gearing and embracing in other particulars the regular Olive construction. It lists at the standard chainless price of \$75.

The Olive company is justly proud of its hanger construction which is not only sim-

Model 32—Roadster. Weight 24 lbs. Price \$50.

ple and light but gives the extremely narrow tread of  $\frac{3}{4}$  inches without sacrificing wheel strength through the use of an excessively narrow chain line, the latter being in the Olive  $1\frac{1}{2}$  inches. The hanger is of the two-piece order and is fitted with square cranks. Its interior construction is shown in the accompanying illustration. All patterns are fitted with Record pedals and regularly with Victor tires, though Morgan & Wright, Goodrich, Dunlop, and on the racer and special, Palmer tires, are offered as options. Several patterns of rigid steel bars of popular shapes, as well as the Kelly adjustable, are offered to choose from and saddles of the various standard patterns are

supplied as desired. Frames are regularly enameled in the distinctive olive shade used by the company, but black is offered as an option if desired.

#### TWO OTIS CATALOGUES.

The Otis Bicycle Co., 114 Dearborn street, Chicago, is sending two catalogues to the trade. One of them is devoted entirely to the interests of the 30-inch wheeled machine, and on its title page the cause of larger wheels is introduced by the couplet, "Antiquity should not privilege error, nor should

novelty prejudice truth." The Otis Special is made in both men's and women's patterns and is fitted with either Ewald or Fauber hangers, the former being supported in an eccentric bracket. Stockton Gem pedals are supplied. The options in handle bars and saddles is liberal, and either the Watson seat post or a plain seat post secured by an expander is offered. The second catalogue shows the Model A patterns and the Otis "Leader," selling at \$35 and \$27.50, respectively. These machines have 28-inch wheels and standard up-to-date lines and equipment.

#### ECLIPSE BRANCH FACTORY IN OPERATION.

The Empire State Cycle Co., of Oneonta, N. Y., which will this year build the medium grade machines of the Eclipse line for the Eclipse Bicycle Co., of Elmira, N. Y., has begun operations, work being pushed through on such parts as the material already shipped to its plant will permit. About twenty-five men are already at work and shipments of material are arriving daily so that the working capacity of the plant will be increased immediately.

#### BURT REPAIR TOOL IN DEMAND.

The J. H. Burt Mfg. Co. of Springfield, Mass., reports that its traveling men are meeting with great success in selling the band tire repair tool made by the company. It is stated that almost every prominent dealer has catalogued them and in accordance with the hearty reception being given the tool plans have been laid for the manufacture of 500,000 during the season.

#### GROWTH OF FRONTENAC COMPANY.

Three years ago the present Frontenac Mfg. Co. was organized as the Syracuse Specialty Co., but a year later changed its title to the present one. Now it has a plant that covers one and a half acres of ground and consists of fine buildings thoroughly equipped with modern machinery. The \$75,000 capital stock of the company has been fully paid in.

#### KEATING SHOPS BUSY.

The works of the Keating Wheel Co., of Middletown, Conn., have been put into full operation and the bicycles familiarly known as having "that curve" will soon be ready for shipment in large lots. The rush work at the plant began last week, when the company posted a notice that 300 men and 25 girls would be given employment at once.

#### BETWEEN PURPLE COVERS.

The preliminary story about Barnes White Flyers is told in a tasty little booklet of specifications and outline drawings of models. The cover is original and artistic, the background being purple and the lettering white. White doves in flight are effectively symbolic of the title "White Flyers" bestowed upon the Barnes bicycles.

#### CARLOAD OF RAMBLERS FOR SPOKANE.

Spokane, Wash., last week received the first carload lot of bicycles ever shipped to that city. The car, which is one of the large vehicle or furniture type, now stands in the railroad yards there waiting the completion of the new store of the Fred T. Merrill Cycle Co., to whom the goods were consigned, and contains 365 Rambler machines.

#### CORRECTION IN FIRM NAME.

The advertisement in the last issue of Cycle Age of the Kling Power chain, erroneously stated that the chain was manufactured by the Upson & Hart Co. The correct firm name is the Kling Power Chain & Wheel Co., Unionville, Conn., to whom all communications should be addressed.

The Werner Company of Akron, O., known to many in the bicycle trade as a first-class printing house which has in the past printed some of the best catalogues issued by cycle concerns, announces that on January 26 it was formally released from the charge of the receiver and now with increased facilities and opportunities at hand is better able than formerly to serve its customers well and deserve their patronage in the future.

Hastings Bros. of Central City, Neb., say that the tool for loosening sticky inner tubes recently described in Cycle Age and which is controlled by a patent granted to Phelps & Brenner, of 729 Main street, Quincy, Ill., is a valuable and successful one for use in repair shops, a similar one made by them having been in almost constant use since 1895.

The W. R. Rollins Mfg. Co. wish it stated that their proper address is Harvard, Ill., instead of Chicago, as was erroneously given in the recent report of the New York cycle show.

# The Zamboni Chain Riveter

It is designed as a convenient, low-priced tool for repairmen, and overcomes the difficulties arising from the misdirected blows of a hammer. The rivet is first upset by the ram at the left, by a blow of a hammer. It is then passed to the other ram, the die of which is quartered and cup-shaped, with a lower die, plainly cupped. This finishing ram has a ratchet cut wheel or gear, which, in connection with the side spring, turns the heading die one-ninth of a complete turn at each blow so that the head is put on uniformly. The rams are lifted automatically by the springs after each blow. The riveter is formed so that it can be held in the jaws of a vise.

A Saver of Time and Money, and No Repair Shop Can Afford Not to Have It.

Price, **\$3.00**

## Just Notice These Points, Mr. Repairman

That it is as complete a riveting machine as those used in chain factories; doing the work as effectively, as perfectly and as quickly.

That it will rivet a link in less than one-tenth the time taken to do it with a hammer by hand, which is the usual method in repair shops.

That the inserted link or links will move as freely and with as little friction as the factory riveted links, it being impossible to compress the rivet in the chain block, the riveting action of the hammer being wholly on the outer periphery of the rivet, the center of rivet being left intact.

That when the link is seated on the anvil it is impossible to rivet it imperfectly, or to compress the rivet in the chain block.

That no other machine or device, other than those in the chain factories, will do the work as quickly or as perfectly.

That the saving in time alone will defray the cost of the machine when it has been used less than a week.

# THE PASTIME AND SPORT

## THE N. C. A. ORGANIZES

**Racing Men and Track Owners Get Together, Adopt Constitution and Elect Officers.**

New York City, Jan. 30.—Last Wednesday the meeting of the elements that do not like the way the League has run racing matters for the past two or three years and which was called to amalgamate them in one homogenous mass and devise methods that would be more to the liking of all concerned except the public, convened in this city with the following delegates present: Arthur Gardiner, representing the American Racing Cyclists' Union; P. T. Powers, the American Cycle Racing Association; J. Lockwood, Berkeley Oval; Nate Salisbury, Ambrose Park; J. D. Lasley, Washington Athletic Park track; W. J. Corcoran, Waltham, Mass., track, and by proxy the St. Louis Athletic Park track.

It was understood the movements of some of the minor promoters would depend on the action of the Manhattan Beach management. Jubilation was therefore emphatic when the owners of the Manhattan Beach, Berkeley Oval and Ambrose Park tracks announced their intention to affiliate with the outlawed pros. The delegates then proceeded to adopt a constitution and by-laws. Election of officers followed, the positions of president and second vice-president being left vacant, the question of filling them to be referred to the nominating committee for a mail vote. H. J. Bloemicke, of Newark, was made first vice-president, and F. B. House permanent secretary. A board of racing control was appointed without consultation with or permission of those put into office for the various districts and A. G. Batchelder was made chairman of that board. Tom Cooper will represent the racing men on the board. Arthur Gardiner is quoted as authority for the statement that Sterling Elliott may become president.

Upon application of the St. Louis track management the National Cycling Association, as the organization is called, will extend its jurisdiction to take in that part of Missouri lying west of the Missouri river. Otherwise the body modestly limits its jurisdiction to territory east of the Mississippi.

## Winter Riding Growing Popular.

Buffalo, Jan. 30. — Winter riding has grown vastly in favor here with those riders who use the bicycle for business purposes. Buffalo has been favored, thus far this winter, with most exceptional weather conditions. There have been few days that a bicycle could not be used, and for the past ten days the pavements have been free of snow. This has brought out hundreds of bicycles that had been stored for the winter and incidentally set hundreds of minds to thinking of new mounts for the coming season. While the chainless is receiving much attention at this early day, the chain machine is not being slighted by any means. There are many riders who like the chain arrangement because it can be used with the "floater," as the automatic brake and coaster is known here.

## Algerians Show Interest in Racing.

A race meet on the Southern Europe winter circuit was run in Constantine, Algeria, on January 15, and was largely attended. The feature of the meet was the prize of Constantine race, for which Grogna, Tommaselli and Banker qualified in the three heats. In the final Banker

took the lead for the last two laps, but, entering the homestretch, Grogna started his sprint and won the race by half a wheel from the American, with Tommaselli third. In the 1,000-meter handicap Banker broke his chain and again Grogna won. The 3,000 meter tandem event was won by Banker and Tommaselli by half a length from Grogna and Coquelle.

## TRACK OWNERS ABANDON LEAGUE

**N. C. T. A. Casts Its Fate With the Outlaws—Others Await Assembly Action.**

New York City, Jan. 30.—The National Cycle Track Association held its annual meeting here last Friday and adopted a resolution dropping from its constitution all reference to the League of American Wheelmen and substituting therefor the words, "National Cycling Association."

Resolutions were adopted to the effect that the National Cycle Track Association appreciates the good work accomplished in the interests of bicycling by the League, but that for the future the best interests of the track owners will lie in affiliating with the National Cycling Association.

The Manhattan Beach, Berkeley Oval, Newark Riding Park, Charles River Park, Providence, Buffalo, Wilkesbarre, Washington, Racine, Wis., Louisville, and Willow Grove tracks were represented directly or by proxy.

The Philadelphia tracks were not represented at the meeting, but are awaiting the action of the League at the National Assembly. Any resolutions of the L. A. W. delegates to continue the control of the sport will be of no avail unless liberal concessions to the dissatisfied are made, as the track owners are in business for financial returns and will join any movement that offers the best promise of success. That the League is losing prestige rapidly in racing matters must be apparent to everybody.

## Canadians Discuss World's Meet.

Officers of the Canadian Wheelmen's Association met in convention in Montreal last Saturday with the committee appointed to discuss matters pertaining to the international meet next summer. Representatives of sixteen clubs were also present. The result of the meeting was to dispel all differences between the C. W. A. and the Montreal Wheelmen regarding the conduct of the meet. The Montreal people are very enthusiastic over the meet, and as they have one of the finest tracks in the world, the attendance should be phenomenal.

## Canada Sending Delegates.

Montreal, Jan. 30.—The C. W. A. has appointed two delegates to attend the annual L. A. W. convention to make arrangements of mutual advantage between the two bodies and to propose that the National League meet be held just after the international championships here. The object is to secure the presence of the European cracks at the championships first, whence they will go to Boston.

All motorcycle records from one to forty kilometers were broken by a young amateur named Bourguin at Paris on January 9. He rode a petroleum tricycle and would probably have placed the hour record close to thirty-two miles had not an accident at the forty-fourth kilometer prevented his continuing. His time for forty kilometers (nearly twenty-five miles) was 45:24 3-5, beating the best previous time by 2:20 3-5.

## CONSIDERING TAX PROBLEM

**Washington Collector of Taxes Favors Levying \$1 License—Wheelmen Object to Measure.**

Washington, Jan. 30.—The collector of taxes has made a report on the proposition to impose a tax on bicycles, which says in substance that if there is a popular demand on the part of bicycle owners for the proposed legislation, with a view of securing protection for their machines, the collector can see no objection to it. Owing to the fact that the bicycle is so universally used for both business and pleasure, he is of the opinion that regulations should be adopted whereby police supervision could be exercised over this increasing method of travel, and at the same time protect the owner from loss.

The chief of police, who first suggested the tax and who has worked hard to secure the passage of a law imposing the same, has come out with a suggestion that the rate should be 50 cents per annum instead of \$1, as first suggested. The collector of taxes, however, thinks that the rate should be \$1, as he believes that amount would be necessary to cover all the cost of registering and tagging machines.

The question will probably not be finally decided by the commissioners of the District until they have had a joint conference on it. In the meantime the wheelmen will bring all their influence to bear to defeat the proposed legislation.

## Southern Cyclists' Association Meet.

New Orleans, Jan. 30.—The first race meet of the Southern Cyclists' Association was run here January 23 and attracted 3,000 spectators. The riding was of a good order and the local riders held their own against the visiting racing men very well. The S. C. A. took occasion before the commencement of events to explain, through its president, John Dymond, Jr., the objects of the association and to distribute road maps and explanatory pamphlets. The S. C. A. is a local organization working on the same lines as the L. A. W. to protect the rights of wheelmen and promote the cause of good roads. Racing is only a side issue to increase interest in the work.

The summaries of the principal events follow:

Half-mile open—Bob Walthour, first; Miller, second; Bert Repine, third. Time, 1:10.

Mile open—Miller, first; Walthour, second; D. Kraemer, third. Time, 2:54.

One-mile S. C. A. championship, amateur—O. L. Adams, first; Benedict, second; Everard, third. Time, 2:47.

Two-mile handicap—Pattison, 400 yards, first; Mohan, 480, second; Gonzales, 290, third. Time, 4:27 3-5.

## Sunday Meet in California.

San Jose, Jan. 30.—The Garden City Wheelmen gave a Sunday race meet here today, in which Orlando Stevens defeated Harry Downing in a series of match heats, winning two straight heats at one mile in 2:10 1-5 and 2:06 1-5 respectively. Floyd McFarland and Charles Miller rode exhibitions, the former going a paced mile in 1:49 3-5. Bald acted as starter.

## Governor Who Favors Cyclists.

Governor Rollins, of New Hampshire, who recently took the oath of office, is a practical cyclist. In his inaugural message he advocated the building of a bicycle path along the entire sea coast of the state, the construction of a state highway from the Massachusetts state line to the summit of Mount Washington, with

## YOUR '99 TRADE WILL WANT An Easy Running and Durable Chain

In our new **Twin Roller Chain** the rocker joint eliminates the friction from this point while the friction between chain and sprockets is avoided by the rollers which turn as the chain feeds off and on the sprockets. This gives you a frictionless and hence a durable chain.

This chain fits the standard 1-in. pitch sprockets and runs smoothly and noiselessly even in mud, water or dust. It makes friends wherever used and will be a great favorite for '99. Write for prices and full description.

**MORSE CHAIN CO., TRUMANSBURG, N. Y.**

branch roads through other sections of the White mountains, and recommended better roads generally, suggesting in furtherance of the plan that experts be employed at all colleges to give instruction in the making of good highways.

### CYCLING IN WEST INDIES

Riding is Growing Popular in Trinidad and Surrounding Islands—Racing Young Yet.

Cycling is widely popular in Trinidad and the neighboring islands of the West Indies, and is securing a constantly increasing number of devotees. Nearly everyone who can afford it possesses a bicycle; even a bishop in full canonicals is frequently seen. The roads in some of the islands are excellent in the dry season, and an early morning spin up one of the lovely valleys in Trinidad, shaded by arches of giant bamboos, is a happy contrast to the weary plough through the dust and glare which must be encountered in less favored localities. Of course, for the century rider these islands afford little scope, but even he, after a few hours' trial of a tropical sun, would be glad to join the peaceful little army that haunts the valleys and more shaded roads, with the prospect very often of a delicious plunge in some cool, clear mountain stream at the end.

The "scorchers," of course, exist, but he is mostly confined to the irresponsible Portuguese and negro, who take advantage of the present want of legislation with regard to lights and pace and rule of the road to do their best to make such legislation, when it comes, harsh and unsatisfactory.

Racing is still young in Trinidad, but in spite of that a very successful race meeting was held last year on a fair, though insufficiently banked, track surrounding the principal cricket ground in Port-of-Spain, and will in all probability be repeated when the ground opens shortly for the season. Valuable prizes are offered and really excellent form is shown.

### RACING CENTER SHIFTING

European Interest Passes from England to the Continent—Major Taylor Lauded.

Commenting on the past season's racing, one of the daily papers of Paris attributes the loss of interest in racing in England to the bickerings between the amateurs and professionals and to the larger prizes offered in the other European countries. While two years ago England was foremost in racing affairs, the center of interest shifted across the channel to France, thence to Germany, where \$25,000 was given in prizes last year, and now seems to be concentrating in Russia.

Bourillon is singled out as being the best and most notable European rider, as no man since Zimmerman's time in Europe has shown such extraordinary form for so long a time, defeating every man of prominence on the European path and winning the great prizes of Italy, France, Germany, Belgium, Russia, etc. General regret is felt because he did not compete in the world's championships in Vienna, where it is believed he would have won great laurels for his country.

After Bourillon, only one other rider in Europe is felt to have proved himself a great rider—Paul Albert, the German amateur champion of the world. After these come Jacquelin and Deschamps, and then in about the same class Meyers, Broka, Grogna, Protin, Parlby, Pontecchi, and Verheyen.

Comparison with the American riders is impossible, since none of the best Europeans visited the United States and none of our top-notchers went abroad

last year. Major Taylor, however, is proclaimed a phenomenon and is felt to stand above all other Americans. The Frenchmen think him a most extraordinary man and predict that he will be the wonder of the nineteenth century among riders, and that he will have an incomparable season this year. They express a great desire to see him ride in Europe, believing that he is a worthy successor of the great Zimmerman. Harry Elkes is also conceded worthy of being classed among the notable men of the past season.

### NEWS IN BRIEF.

"Plugger" Bill A. Martin is racing at Cape Town, South Africa.

The Belleair, Fla., quarter-mile track has been remodeled and resurfaced.

George H. Collett has accepted the invitation to coach the Yale bicycle team the coming season.

The Cyclists' Touring Club of England now has 54,300 members, of which number 21,000 joined the club in 1893.

A. A. Chase was recently suspended for two months by the N. C. U. for competing in a road race, which is prohibited by the union.

The oldest cyclist in the world is said to be F. E. Richardson, member of the Amateur Cyclists' Club of England, who has ridden the bicycle since 1862.

The municipal council of Gratz, Austria, has voted a special reward to a policeman for recovering twenty stolen bicycles during the past two years.

A proposition is afoot to take a party of racing men to Brazil, where it is believed that even second raters might pick up good purses among the South Americans.

The Austrian railroad association has decided to build special cars for the transportation of bicycles and has given orders to employes to handle bicycles carefully.

It is rumored that Nat and Frank Butler have received an offer from a manufacturer of chainless bicycles to join his outfit of pacemakers, they to be equipped with a motor tandem.

The Western passenger association has unanimously agreed to maintain the old rule of charging excess baggage rates on bicycles, with a minimum charge of 25 cents for any length of haul.

The judiciary committee of the New Hampshire legislature has declared the proposed law to tax or license bicycles to be unconstitutional and has rendered an unfavorable report upon it.

Bouhours, the French middle distance crack, won twenty out of thirty-five big races in which he competed last year, winning \$9,400 in prizes and receiving \$1,200 from the firm whose machine he rode.

George Banker expects to return to America next summer to compete in the world's championships at Montreal. All his successes have been won abroad, and he is anxious now to win a big race on this side of the Atlantic.

It is asserted positively that George L. Cooke of Providence, chief consul of Rhode Island, will be a candidate for the position of second vice-president of the L. A. W. in opposition to Kingsbury of New Hampshire and Locke of Illinois.

It is reported that Bald, Elkes, Owen Kimble and the Turville brothers are forming a racing team to go to Europe for an extensive tour this year. Both Tom Eck and John West are mentioned as prospective managers of this trip.

Arrangements for the entertainment of the delegates to the National Assembly which meets in Providence, R. I., on February 8, are practically completed. The convention will probably be in session during Wednesday, Thursday and Friday.

Buffalo, Jan. 30.—According to reports in circulation here, Bald has not had enough of the stage, but will try his hand at vaudeville. This report comes from no less a personage than Mr. Leuscher, Bald's old manager, who made the statement to a local newspaper man last week that the actor-rider had signed a contract and would take the third act of "The Twig of Laurel" into vaudeville next season, following the Grau circuit. Earl Kiser and Nat Butler, Mr. Leuscher said, would go with him. Mr. Leuscher also stated that Bald would ride

Mention The Cycle Age

abroad the coming season—a statement which comes in the nature of a surprise to his Buffalo friends, in view of his connection with the outlaw association.

Wheelmen of Terre Haute, Ind., have organized an independent political body to support candidates who will pledge themselves to support the best interests of the cyclists, especially with a view to defeat the proposed measure to tax bicycles \$1 each per year.

Brady, Kennedy and Hurst are arranging to run a six-day race in Denver in which the long distance men now in San Francisco will compete on their return trip east. It is also contemplated to have them stop in Chicago and perhaps in St. Louis.

The two leading cycling clubs of Minneapolis and St. Paul are intending to unite in promoting and controlling racing in the Twin Cities the coming season. The object of the combination is to give outlaw racing in those cities a recognized and substantial backing.

Out of the twenty-three racing events arranged for France the coming season nine are for motor vehicles or motor bicycles and tricycles. These latter events are all road races, the last one, to be run October 9, being a contest between vehicles driven by alcohol motors.

Two Austrian racing men who won some local fame on the tandem are now doing police work on motorcycles in Vienna, where their duty is to enforce upon wheelmen and users of automobiles the regulations prohibiting fast riding and requiring the carrying of registered tags.

Joe Downey, cyclist Michael Junior, has returned to grammar school from which he will graduate this year. When Harry Gibson defeated him in Madison Square Garden at their last meeting the crowd yelled to Downey, "Better go back to school," and he took their advice to heart.

The French minister of commerce has signed a decree for the organization of a series of ten athletic prize competitions to be run while the Paris exposition is in progress. The bicycle and automobile races will be run on the municipal track of Vincennes and on the road surrounding one of the lakes in the exposition grounds.

According to an eastern man with Sherlock Holmes tendencies, Boston has won the '99 League meet. While all of the ballots of the mail vote have not been received enough have been sent in to settle the question and the man who made the statement that Boston had won discovered that the ballots were printed in very heavy type and inclosed in thin envelopes. By holding the envelopes to the light it could be easily seen how the delegates had voted.

Representative Adams of Arapahoe county, himself an ardent wheelman, will introduce into the Colorado legislature a bill to create a state highway commission of three members to gather statistics regarding the mileage of Colorado wagon roads, the percentage of taxes applied to the improvement of roads and providing that at least one member of the commission be required to visit each county annually and hold a general meeting for the discussion of the improvement of the country road system.

The Wisconsin division of the League decided at its recent annual meeting that its delegates to the National Assembly should make a strong fight to secure in the apportionment of L. A. W. funds a greater share for the divisions and less for the national organization. The plea will be made that while there is more than \$18,000 tied up in the treasury of the League, the divisions are on the verge of bankruptcy. The meeting was also productive of action in favor of waging the fight for the free carriage of cycles by the railroads, and of the decision to present a bill to amend the general city charter so that bicycles shall not be licensed by cities. Janesville secured the state meet.

The Secretary of the Interior, who has jurisdiction over the Yellowstone National Park, has issued instructions for the information and guidance of parties traveling by bicycle through the park. As many of the horses driven in the park are unused to bicycles and liable to be frightened by them, wheelmen must in meeting teams always dismount and stand at the side of the road—the lower side if the meeting be on a grade. In passing teams from the rear, riders will ring their bells as a warning and inquire of the driver if they may pass. If it appear from the answer that the team is liable to be frightened, they may ask the driver to halt his team and allow them to dismount and walk past. Wheelmen touring in the park will be held responsible for all damages caused by failure to properly observe these instructions.

## PERSECUTING CYCLE DEALERS

### Buffalo Dogberrys on Edge — Excuses Brought By Buyers to Evade Paying for Machines.

Buffalo, Feb. 7.—Ever since the close of the riding season the dockets of the courts of Buffalo have been liberally sprinkled with cases wherein the bicycle has figured. Hardly a day passes that one or more cases are not heard in the different courts, and with few exceptions they are suits brought by cycle tradesmen against delinquent customers. Nearly all are products of the long-time payment plans which were followed extensively in this city last year, principally by concerns that put out cheap goods. Of the various pleas put in by defendants, that of misrepresentation largely predominates. As a rule, the courts sympathize with the defendant, or buyer, and this feeling is perhaps justified on account of some cases savoring of sharp practice that are occasionally brought to light. Unless it is shown that there is intent to defraud, the dealer usually gets the worst of it.

#### A Venomous Judge.

As an illustration of how the courts feel towards bicycle dealers, the following is a fair sample: J. L. McGraul, a bicycle dealer, had an 11-year-old boy arrested for selling a bicycle that he rented the boy last August, and the court, in sentencing the lad, said:

"I suppose I must convict this boy, but let me tell you that you are about the meanest specimen of humanity on earth. You don't care if a child is sent to the lower regions, so long as you can make twenty-five cents. If you did, you wouldn't let a boy of this age have a wheel without an order. It was a despicable trick to swear out a warrant for this boy. I will send him down, for I guess he has sold several rented wheels, but I only wish I could send you to prison. You are worse than a receiver of stolen property. I'll get you some day."

#### Variety in the Programme.

The programme varied from the usual recently when a man brought suit against a firm of side street dealers to recover the price paid for a bicycle on the ground of misrepresentation. The complainant testified that the machine was sold to him upon the representation that it was made in 1898. He contended that he was deceived because it was not fitted with ball retainers. All machines made in 1898, he declared, were made with ball retainers. But upon the testimony of several cycle people that bicycles were now being made that were not fitted with retainers, he lost the suit.

#### An Important Legal Precedent.

A suit was tried before a judge and jury in the supreme court here last week which is unique and important because

it is the first time in local history that the municipal ordinances pertaining to the travel of vehicles on the city streets were passed upon by a judge and jury. Last May a man was run down while riding a bicycle by a brewing company's wagon. The man received injuries that incapacitated him from work and his bicycle was wrecked. He brought suit against the owners of the wagon to recover \$5,000. The jury promptly returned a verdict for \$600.

## SINGLE TUBE TIRES ABROAD

Deviation from American Form of Manufacture Made Necessary in Order to Secure Trade.

Renewed effort is being made to educate the British public to the use of single tube tires. When the Single Tube Tire Company, composed of the makers of Hartford, Goodrich and Vim tires, was formed a year ago for the purpose of invading Europe and Great Britain, it was freely predicted that they would spend a twelvemonth in vainly endeavoring to force their goods upon continental and British riders, and in the end would recognize the fact that they would be unable to compel an appreciation of the American style of manufacture.

The prophecy has come true, and it is now announced that, owing to the thorns and flints to be found on all English roads, as well as to the influence which English tire manufacture exercises on the minds of continental buyers, tires especially made for British and continental roads will hereafter be supplied by the Single Tube Tire Company, which implies considerable deviation from the American products of the establishments making up that concern. Two patterns of tires will be made, one having a very open fabric, which will be supplied for speed work, the other with a close fabric intended for road work.

The company has made careful arrangements for helping the agents. They make a feature of vulcanizers for the heavier forms of repair work and send them to agents with full instructions for use.

The Decauville bicycle and automobile factory situated at Evry - Petit - Bourg, near Paris, France, was burned January 24, the loss amounting to more than \$160,000.

## PLAINTS OF THE CANADIANS

### Despite High Advalorem Duty They Ask for Additional Duty on Each Machine Imported.

The Canadian cycle trade is now complaining that the Dominion is being used as a dumping ground for the product of American bicycle factories. It is said that the Canadian Bicycle Manufacturers' Association has vainly attempted to arrest the shipments of our machines by petitioning the Canadian government to place a specific duty of \$9 on each machine in addition to the ad valorem duty of 30 per cent, irrespective of grade of manufacture.

#### Find Fault With Cheap Construction.

There is not a part of an American machine which is not subject to bitter criticism across the border. For using pressed cups instead of turning them out of the solid bar; for employing fork sides which are not seamless; for constructing frames of tubing naively alleged to be of "indifferent quality;" for equipping saddles of the most "flimsy construction"—for these and many more sins of commission and omission our manufacturers are roundly abused. But they are given credit for being able to put a lustre on frame enamel which brings the purchaser to book.

#### Cannot Compete With Low Prices.

"There are tricks of the trade, too," says a daily newspaper which has taken up arms in defense of the Canadian manufacturers. "For example, a machine the retail price of which should be \$25 will be catalogued at \$60, and then sold at \$35 or \$40 on the plea of over-stocking. More cheap bicycles than ever are being received from the United States and they are seriously interfering with Canadian manufacture. Canadian makers do not object to the importation of high-grade American bicycles, as they can compete against them. But the trash is getting into the trade, and already has been instrumental in reducing the wages of cycle factory labor. Canada is the dumping ground for cheap and bankrupt stock.

"As an incidence of the rubbish that is offered, it may be stated that a representative of an American tire house was in Canada not long ago offering tires at \$1.75 a pair."

#### Conditions Common in United States.

Considerable surprise is affected over the fact that one of the invaders is offering bicycles to the trade at \$10 without tires and \$15 with tires. A little familiarity with the conditions in this country would show the grumblers at this state of affairs that such an incident is an every-day occurrence in the United States, and yet no great outcry is heard.

A carload of bicycles recently passed through Kansas City on the way to Manila.

**EXPECTED BIG TIRE PROFITS**

**ENGLISH PROMOTER TOO SLOW**

**Slips Up on a Deal to Sell Morgan & Wright Patents Abroad—Sues for a Million.**

Some years ago Morgan & Wright, through the medium of a Chicago attorney, agreed to sell the patents on their well known tire in every country in the world except America to an Englishman named Joseph. The purchase price was fixed at \$1,000,000, payable one-half in cash and the remainder in shares in a company to be formed by Joseph. A deposit of \$15,000 was to be paid by November 30, 1896. This sum was tendered, but on November 20 of the same year Morgan & Wright served notice upon Joseph that they repudiated the agreement, and accordingly Joseph entered suit for \$1,000,000 damages, which he estimated as the sum he would have cleared by the promotion of the company.

**Wanted to Sell Outright.**

The case was recently aired in the British courts. Morgan & Wright's solicitor contended that the firm had never authorized the Chicago attorney to enter into such a contract, but had sent to England to try to find a purchaser for the European rights of their patent. The solicitor stated that Morgan & Wright were willing to accept \$500,000 cash for their patents, but distinctly declared that the firm did not wish to be mixed up in the promotion of any company.

Judgment was given in favor of Morgan & Wright. The court, in rendering his decision, stated that it was obvious that the company which Joseph intended to float would have been ruinous to all who had anything to do with it.

**Movement to Lessen Cycle Thieving.**

An organized movement is afoot in Michigan to make bicycle theft grand larceny, irrespective of the value of the machine. While the special police of Detroit have done much to prevent cycle

stealing and to bring thieves to justice, there is still in the eyes of the cyclist room for efforts which will further protect the riding public. More than 400 bicycles were stolen in Detroit alone last year. One of the main difficulties in the way of bringing cycle thieves to merited justice is the inability to satisfy a jury that the stolen machine was worth more than \$25, the dividing line between petit and grand larceny. On account of the rapid depreciation in market value of second-hand bicycles, it is seldom proven that a machine is worth, were it placed for sale, anywhere near what it is worth to the owner. Further than this, it is stated as having been the case in many instances that the defense in cycle thieving cases have brought into court as expert witnesses agents and dealers selling some rival make of bicycle to that stolen. These dealers, in order to "knock" the make of the stolen machine, would swear that it was not worth \$25.

**Opposing the Canadian Shows.**

In its opposition to the cycle shows which promoters are attempting to arrange for Montreal and Toronto, the Bicycle Manufacturers' Association of Canada is advertising that, with the acquiescence of each of its members and other makers, it has decided not to exhibit bicycles or parts thereof at such shows, nor to permit any agent or agents of its members to make an exhibit. No other explanation is offered than that each manufacturer has large showrooms in these cities where his machines and products are at all times on exhibition free of charge to the public.

**Boston Cycle Supply Men Organize.**

The cycle supply men of Boston recently met and organized the Cycle Dealers' Supply Association. Ten firms were represented at the meeting. The object of the organization is to conserve the business interests of those who sell bicycles, parts and sundries. A committee consisting of Daniel S. Pratt, Joseph A. Cushing and J. F. Scott was appointed to prepare by-laws. Dealers desiring further information are requested to communicate with Secretary King at 69 Purchase street.

**TO OPEN THE SEASON'S TRADE**

**LOCAL EXHIBITIONS PLANNED**

**Space for Philadelphia and Washington Shows Well Taken—General Opening in Cleveland.**

Every foot of exhibition space in the local show promoted by the Philadelphia cycle board of trade, to be held the week of February 18 to 25, has been taken, the more desirable booths having been auctioned off at a premium. Every Philadelphia dealer, without exception, will be represented, and a dozen out-of-town manufacturers of bicycles and sundries will have exhibits there.

A very few of the booths at the Washington, D. C., cycle show remain to be disposed of. Manager John Woerner visited the New York show and closed contracts with about twenty exhibitors there to make generous displays in the capital city during the week beginning February 27. The manager also expects to visit the Philadelphia show and secure additional contracts for space.

**Cleveland Decides Against Show.**

The Cleveland cycle board of trade, at a recent meeting, decided not to hold a local show, but to repeat last year's experiment of a general opening of all the stores, to be held during the week of February 20. A committee was appointed to handle the matter. The annual election of officers of the board resulted as follows: President, George Collister; vice-president, H. S. Covey; secretary, George S. Waite; treasurer, H. K. Taylor.

The proposition of the Hartford Wheel Club to hold an exhibition of bicycles and sundries in Hartford, Conn., has fallen through, owing to opposition which developed. The plans contemplated renting spaces for \$1 per front foot and charging only fifty cents for a season ticket. The low price of admission was expected to swell the attendance very materially, to the direct benefit of the exhibitors.

**Baltimore Promoter at Work.**

The owners of the Coliseum building near Baltimore are endeavoring to arouse interest among the dealers of that city to the point of holding a local exhibition of bicycles and sundries.

A proposition has been advanced as a feeler to determine the attitude of the dealers of Portland, Ore., toward the holding of a local cycle show in that city, not so much in the nature of an exhibitor's display as a cyclists' carnival, with the show feature added.

The bicycle dealers in Grand Rapids are planning for a formal opening of the season's trade during the last week of this month.

**Rochester Pedal Co.'s Plant Scorched.**

A slight fire occurred in the power room of the Rochester Pedal Company's plant in Rochester, N. Y., last Thursday, which will delay the work of the company for about a fortnight. The machine and assembling rooms were not injured, the greatest damage having been done in the case-hardening department. The company is working twenty-three hours a day to minimize the interruption as much as possible.

**Trade in the Northwest.**

The cycle trade in Oregon, Washington and Idaho last year was twice as great as that of 1897. A flourishing trade is done by dealers with the better class of people throughout the entire northwest. It is said that many of the agents in Portland, Ore., who are doing a heavy busi-

**CONDITION OF ENGLISH CYCLE INDUSTRY.**

The condition of the English cycle manufacturing industry is fully revealed in the table given above, which shows how roughly many of the leading concerns have been handled in the past year.

ness, make a practice of crying hard times and poor business. This in a measure accounts for the stories being circulated in other cities of the northwest that cycle trade affairs are very dull in Portland. In reality there is not a city on the Pacific coast which enjoys a more thriving cycle trade, and the authority for this statement is one of the largest dealers in Portland.

**STEALING AMERICAN DESIGNS**

**Machine Tools Are Imported by Austrian Shops Simply as Models—Protection Available.**

The introduction of American machinery and tools into Austria has created a larger demand for machine tools of increased capacity and greater accuracy, which has caused the native manufacturers to make especial efforts to reach the high standard of many lines of American origin. The desire to supply this demand has led some of the prominent Austrian shops to the extreme and reprehensible practice of taking orders for a number of machines of special design and then buying one from the United States, either direct or through an agent, taking it apart, having drawings and patterns made, and, in short, imitating it down to each screw and pin.

A great number of prominent machine tool builders on the European continent advertise their tools as being built on American plans. This means they improved their regular patterns to the best of their knowledge, adopting some American ideas. Nobody could say anything against this if it is done in a fair way, but the competition referred to above could not be called fair.

Everyone who attempts to imitate a certain machine tries to improve it a little, and if he does not find anything to do he puts in a little more weight here and a little less there, or replaces a worm gear by a bevel gear, or anything else which in his opinion might give a little feature in addition to those the machine already possesses.

This seems to be but human nature. Now one could say that in very many cases such an "improved" machine fully resembles a previous stage of the original construction, and that it shows anything but an improvement; in some parts even just the reverse.

American manufacturers will find perfect legal protection in all the European countries where such imitations could be expected. The patent laws of the principal industrial countries afford protection, and manufacturers should not spare the cost, which is not too high, of having their improvements thoroughly protected. A few machines that they will sell in preference to foreign imitations will be sufficient to indemnify them in every respect.

**Trade Change in Wichita.**

The partnership heretofore existing between J. R. Mead and A. J. Musselman in Wichita, Kan., known as the Mead Cycle Co., has been dissolved, J. R. Mead, the senior partner, disposing of his interest to Jos. W. Musselman, the new firm taking charge of all accounts and business of the old firm and the new firm being known as Musselman Bros. A general jobbing and agency business in bicycles will be carried on in connection with a repair shop and general supply depot.

A Pennsylvania bicycle maker has received an order for 200 bicycles to be used by the government in Sydney, New South Wales.

A Chicago bicycle maker is exhibiting a tandem with 30-inch wheels, one of the first double-seated machines to be thus equipped.

**EXPORTS FOR ELEVEN MONTHS**

**HEAVY INCREASE IN NOVEMBER**

**Our Foreign Trade for the Past Year Likely to Exceed the Business Done in 1897.**

Delayed governmental returns on the exports of bicycles, parts and material for eleven months ending with November (1896, 1897 and 1898 in comparison) are here given:

**Bicycles Exempt in Minnesota.**

The Minnesota state senate has passed a bill exempting from execution one bicycle for each person. Despite this recognition of the bicycle as a necessity, there are still many localities where they are considered a luxury and efforts are being made to tax them. With the various recent rulings against the legality of a tax and the above bill as precedents, organized effort should experience little difficulty in defeating future efforts to tax bicycles.

**Canadian Jobbers Revolt.**

Canadian hardware jobbers have decided to boycott manufacturers who sell direct to retail dealers. It seems that the Canadian jobbers and manufacturers had an agreement to the effect that the latter should not sell the retail trade. This agreement the manufacturers have violated, according to the reports, and now the jobbers are up in arms against the offending manufacturers. Representative firms from all parts of the Dominion were present at a meeting recently held at Montreal when the plan to boycott the manufacturers was determined upon.

**Stanley Wagons Under Construction.**

There has been a rumor afloat in regard to the organizing of a \$300,000 company to handle the Stanley steam wagon, but nothing has yet been actually done.

It is expected that the first of the new model Stanley steam wagons will be completed by the 1st of March, and that the remainder of the hundred under construction in the first lot will follow rapidly.

The case of the B. F. Goodrich Company against Humber & Co., Limited, et al., has been removed from the superior court to the United States circuit court on motion of the English stockholders.

Austrian cycle fittings makers are petitioning their government to increase the duty on these goods.

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## DIP BRAZING ENDORSED

"The new process of dip brazing enables us to guarantee the perfect union of all members of the frame, and the flush joint is therefore a feature of Sterling construction as well as the outside connection." With this straightforward reference to dip brazing as a method assuring superior mechanical results, the Sterling Cycle Works company takes rank as the first well known cycle manufacturing concern which makes it a point to acknowledge openly in its catalogue that it considers the new method as something more than a measure of economy, and, indeed, as a distinct improvement which, in the company's opinion, is indispensable for any conscientious bicycle manufacturer who desires to guarantee his customers that all flush joints in the frames of his manufacture are sound and reliable. The company emphasizes its statement by adding that it has been slow to adopt flush joint construction, as "we felt we could not be assured that the parts were thoroughly united."

The reputation which the Sterling company has earned in the past for high-class work, careful selection of material, and cautious testing at every new step, cannot but add to the importance which the trade at large will attach to its endorsement of dip brazing.

As a money-saving method, whose value to the rider was undiscussed and therefore of doubtful value from a commercial standpoint, the practice of dip brazing was hedged with reserve and secrecy until The Cycle Age, firmly convinced that the method had virtues which should recommend it strongly to riders of bicycles, undertook to place it before the whole trade.

Now, with the ice once broken by a highly reputable firm of bicycle makers, it seems safe to predict that other manufacturers who have reached results with dip brazing which were satisfactory to themselves, will speedily make their agents and patrons conversant with all the claims that can be made for the method in regard to safety against burning of tubing, non-flowing of spelter, and other causes of unforeseeable breakdowns which in the aggregate have done much to diminish the popularity of cycling.

## DEFENSE FUND NEEDED

Every bicycle maker in this country is haunted and made nervous by the fear that the exact measure of his legal liability for accidents resulting from defective construction will one day be harshly and definitely fixed

by a court of competent jurisdiction. The same dread is felt by English makers. But the German manufacturers, more rash than either the Americans or English in seeking light on the subject, have already found to their great dismay that there are more common law rights granted to buyers of bicycles than it is wise to exploit—indeed, have ascertained that though a machine may be guaranteed for a year or longer, yet this guaranty in no way implies an abrupt termination of the period of responsibility, which is held to extend for five or six years.

There is little doubt concerning the anxiety of our makers to see this important question settled, but the difficulty in the way of a decision is one which might naturally be anticipated from the risk which would inevitably attend a prosecution. Aside from the fact that martyrs are scarce in the cycle trade, there is but too much reason for believing that the courts would hold the low factor of safety in construction to be adequate cause for pronouncing adversely against the defendant in a case which was vigorously pushed. The guaranty is no shield; on the contrary, it is merely a proclamation of good intention on the part of the maker, and if legally accepted by the purchaser, does not

constitute a waiver of right to sue for damages if, after the expiration of its period, the machine shall prove defective. It is of no more value in defense against suit for damages than the acceptance of the conditions attached to a railroad mileage book, which commonly is supposed to act as an effectual barrier against legal proceedings in the event that the holder is injured while being transported over the road.

There is quite a distinction as to liability on the part of a manufacturer and of a dealer, the first being responsible for latent defects, while the latter is not, if he buys from a well known maker whose reputation is established, and he is permitted to rely upon that reputation. This is also true of the manufacturer, where he buys his parts, such as tubing of a well known make; in this case, the maker of bicycles is not responsible for invisible defects, all that is required being that he buys the best in the market and uses care and skill in putting it together.

The number of reputable firms which have paid hush-money rather than be dragged into court may never be known, but it is doubtful if they would have resorted to such tactics were they assured that others, similarly victimized or threatened, would come to the rescue with money and counsel. It is not alone in this matter that the cycle making industry stands in need of a defense fund. There are other dangers, and far greater, threatening.

## CREDIT IN COLONIAL COUNTRIES

When the question of allowing or not allowing credit in export deals is put as broadly as it usually is, it loses its point. "Foreign" trade includes a big scope of country, and it is hardly possible to apply the same rule to all of it. Yet the cry for credits, as voiced by our consuls, comes with almost equal vigor from all parts of the world.

What really most puzzles our exporters is not, however, the well-meaning admonitions of our representatives abroad, which may be taken with a grain of salt, but the observation that those markets where trade follows liberal credit methods are precisely the same where the danger in allowing credits is greatest and where our facilities for protecting accounts are most meager.

As a general rule, it may perhaps be said that where the means of communication and transportation are lagging behind the progress of civilization in other respects, there the demand for credit is peremptory, while the protection afforded creditors depends upon facilities which the American exporter usually does not possess. The liberal prices which prevail in these markets furnish the inducement for European colonial traders, who hold the key to the credit situation, to buy American bicycles for cash and either reship them to their colonial customers or have them shipped directly from New York.

This applies to the colonial countries, where the tide of new enterprises runs high and where cash capital is made scarce by the constant demand for it. South and Central America and Mexico, while not colonies, belong to this class, and British India and Java on the other hand, though colonies, have reached a point in development which makes credit less imperative for trade than quality and price.

In European countries where the creditor is well protected it might seem as if the system of selling for cash against documents were not indispensable; and, in fact, deviations from it have been freely made in the past year or two. But the question has two sides: In the colonial countries much trade would be gained if credit could be generally conceded with safety. In Europe credit is practicable, but hardly altogether desirable.

The European importer who, in the midst of a comparatively easy financial market, is incapable of producing cash at a rate of interest much below the discount that our manufacturers can afford to allow for cash, is readily distanced by the many who can do better, and under such circumstances extension of credit is practically a bid for unsafe trade and therefore a confession of weakness.

With all its undisputed drawbacks, the cash system is probably for the present best adapted to our commercial position: in new countries because ye cannot yet get around it, and in older foreign communities because the risk and expense inseparable from a credit system are not offset by prospective rewards in the form of high prices or much increased volume of business.

# CRESCENT BICYCLES 1899 CRESCENTS ARE NOT '98 MODELS

When you buy a CRESCENT you get the wheel of all wheels—the STANDARD both in PRICE and QUALITY—the one bicycle that has always been sold the year round for the same standard price—the POPULAR WHEEL—the wheel you want.

# MILWAUKEE TIRES

## PUNCTURE PROOF

Pneumatic

Resilient

Single Tube

Easy Riding

COPYRIGHT 1898, BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.

PRESENTING TESTIMONIALS:

Office of Judge of Probate of Menominee County, Eugene Grignon, Judge.

MENOMINEE, MICH., Jan. 12, 1899.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
 Dear Sirs:—I take great pleasure in testifying to the worth of your "PUNCTURELESS TIRES," a pair of which I rode all last season, without a puncture, and with perfect satisfaction. I weigh two hundred and seventy-five pounds, and never before have been able to get a tire that would hold for any length of time, besides being punctured from one to three times a week. I am riding your tires and feel perfectly safe, and they do not require inflating oftener than once in two weeks. I shall recommend your tires to all my friends.  
 Yours respectfully,  
 (Signed) EUGENE GRIGNON, Judge of Probate.

MANISTIQUE, MICH., Dec. 11, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
 Gentlemen:—In reply to yours of recent date, would state that I am very well pleased with your tires. My boy is hard on a wheel, and they have stood it the best of any tire I have yet used.  
 He has ridden the tires all season and the tires are as good as new.  
 Very truly,  
 (Signed) JOHN WOODRUFF.

## BRAZING BY IMMERSION

### Requirments of a Crucible—Effect of the Flux Upon Its Walls—Method of Removing Spelter

Crucibles for bicycle brazing are made in triangular shape for the purpose of allowing the four corners of the frame to be dipped in a comparatively small body of molten spelter. Any other shape would necessitate the heating of twice or three times the amount of spelter, for the frame tubes are immersed to a depth of five or six inches. If the crucible were round, it would need to be of large diameter to furnish sufficient immersion of all parts.

#### Purpose of the Flanges.

The flanges of a crucible would at first thought appear to be superfluous except on the ends, for the side flanges are not used to support the crucible as are the

OLD AND NEW CRUCIBLE, FORMER SHOWING EFFECTS OF FLUX.

end flanges. But the side flanges play a very important part in the control of the heat. As the heat arises alongside the crucible it strikes these flanges and is checked and diverted, passing around over the top of the flanges and out through an opening not over half an inch wide. If the flanges, which are  $2\frac{1}{4}$  inches wide, were not there, the flames would pour out without anything to check them, and the operator would have difficulty in preventing his face from being scorched, and the fuel would burn up in half the time. The inside measurements of the crucible are about 24 inches in length, 6 inches in width, and 9 inches in depth.

#### The Best Fuel to Use.

The best fuel to use in a brazing furnace is hard coal. It produces an intense heat, with very little smoke. The lumps, being of uniform size and not too large, can be fed into the furnace more readily than coke, and the fire is more compact. Gas would require a furnace of different construction. It has a tendency to shorten the life of a crucible and produce an uneven heat if not scientifically handled.

#### Heating and Cooling Uniformly.

A crucible should be heated and cooled uniformly. More depends upon the regularity of the temperature at all points than upon sudden changes to extremes of heat and cold. To illustrate: A crucible heated to a white heat can be suddenly plunged into a tub of ice water without breaking, because all parts of the material cool and contract evenly. On the other hand, if a draft of cold air be allowed to strike one part while the rest is hot, it is likely to crack at the point where the cold air strikes.

#### Drying Crucibles Before Use.

Crucibles are susceptible to dampness and gather moisture very readily. They are annealed before leaving the factory. When received, they should be imme-

diately unpacked and stored in a warm, dry place. Before using they should be re-annealed to remove any moisture gathered in transit. This can be readily accomplished by placing them in the enameling oven and gradually bringing the heat up to 212 degrees. If this is not done, they may scalp or flake off on the first heat.

#### Removing Spelter from Crucible.

Spelter should never be allowed to cool in a crucible, for when it is re-heated it expands and breaks the crucible. It should be dipped out and poured into a mold like that shown in the illustration. The bars in the mold will re-melt much more readily than if the spelter is re-

moved from the crucible by other means.

The crucible should be placed in the brazing furnace with the two end flanges resting on the brick work and the side flanges unsupported. Projecting bricks from the side walls of the furnace should engage the bottom of the crucible so that the weight is evenly distributed. Some prefer to set a brick directly under the bottom of the crucible; others claim this interferes with the fire.

#### Action of Flux on Crucible.

The flux which floats on the top of the spelter in a crucible gradually eats its

MOLD FOR SPELTER.

way into the walls, as may be noticed in the illustration, and eventually would cut clear through if the crucible did not first crack or give way at some other point. A good practice is to lower the surface line of spelter occasionally and allow the flux to attack a new level, and thus prolong the life of the crucible.

If a crack should develop and allow a little of the spelter to run into the fire,

a blue flame would appear. The spelter should be dipped out at once, the old crucible removed, and a new one substituted. It rarely happens that a crucible breaks suddenly. It has occurred in brass foundries, but has never been reported in bicycle practice. The average life of a brazing crucible can be conservatively estimated at ten days. Instances have been reported where twenty and even thirty consecutive days' use has been obtained. Much depends upon the manner of handling. As the operator becomes familiar with the peculiarities of his crucible, he will be able to obtain more efficiency. A broken crucible cannot be repaired.

#### Graphite is the Best Material.

No other material is so well adapted for use in crucibles as graphite. It is the form of carbon nearest to the diamond form and is unaffected by heat or cold, or any known chemical. It is an excellent conductor of heat. As it comes from the mine, it contains from 50 to 60 per cent of sulphur, silica, and other impurities, which are eventually set free.

Melung pots have been made of clay, glass, platinum, lime and, for very low fusion metals, of iron. Glass on account of its brittle nature, platinum on account of the enormous expense and the fact that it corrodes if heated with alkalides, and fuses with the oxides of metals of easy reduction, lime and iron for obvious reasons, all have been used only for special work, but can never come into general use and hence deserve but casual mention in this article.

#### Development of the Crucible.

An English patent was granted in 1762 to William White for the manufacture of clay crucibles. They stood the heat fairly well, but had to be heated slowly. If plunged suddenly into an intense heat they would crack. They would not stand alternate heating and cooling. Flux ate them up very quickly, and altogether they were not to be compared with the established standard for crucibles of today. Slight improvements were made from time to time by the addition of coke, etc., but the clay pot of today is very little different from that of 1762. In 1827 Joseph Dixon discovered the plumbago crucible and revolutionized the business of melting metals.

#### Suggestions Are Plenty.

Many suggestions are made to the crucible bakers for alterations in shape, changes in the thickness of ware or flanges, etc. These suggestions will all receive due consideration, but it must be remembered that there are many reasons why they may not be practical and cannot be adopted. Crucibles cannot be made in a day. It is a tedious process. After the materials are prepared and fashioned into the proper form, a week is required to dry them thoroughly. Another week must elapse before they are out of the kiln, to say nothing of the time necessary to transfer them from one department to another, pack, ship, etc.

Crucibles are not all made of the same mixture. They vary in nature according to the composition of the metals to be melted, the intensity of the heat to which they are to be subjected, the flux, the style of furnace, the draft, etc.

#### Combined Cycling Hose and Garter.

Albert Gutschne, of Philadelphia, has invented a means of weaving strands of rubber together with the yarn of a woolen stocking and of fastening the ends so as to cause the top of the stocking when rolled down, as in the usual golf pattern, to cling firmly to the leg. Many local wheelmen are already using these hose. The process is also applicable to hosiery of all kinds.

## COMMERCE IN FOREIGN MARKETS

### BELGIUM CYCLE MAKERS ACTIVE

A prominent Belgian tradesman is endeavoring to form some of the largest cycle concerns in his country into a syndicate for the purpose of exporting to South America, Asia and Australia. It is the intention to procure the services of a first-class traveling salesman, who will be provided with samples of bicycles, fittings, equipments, sundries, etc., and he is to make a tour of South Africa, the West Indies, Australia, New Zealand and South America. At the most important points he is to make special displays of his wares in order to make known the low prices of Belgian cycle products. Price lists and catalogues printed in the languages of the countries in which he may happen to find himself will be distributed. It is expected that the Belgian government will give financial aid to the project and that the consuls will lend all assistance in their power.

Belgian cycle imports for the past year show a great decrease as compared with the two previous years, as the following figures prove: 1898, \$379,100; 1897, \$436,975; 1896, \$637,305. The exports, on the other hand, have considerably increased, the figures for the three years being: 1898, \$537,060; 1897, \$484,195; 1896, \$334,725.

### TRADE POSSIBILITIES IN RUSSIA

Notwithstanding the rapid progress Russia is making in the establishment of manufactories, which are being encouraged by the government, she is not able to keep pace with the increased demand for iron, locomotives, cars, coast steamers, battleships, elevators, electrical apparatus and supplies, woodworking machinery, tin plate, agricultural implements, rosin, cotton, roofing slate, leather, scales, heavy ordnance, typewriters, tools, bicycles, sewing machines, hardware, coal and other machinery, photographic materials, as well as in other lines in which our supremacy is unquestioned.

Ambassador Hitchcock has been consulting American residents of St. Petersburg and Moscow, as well as American manufacturers who have visited the former city during the past year, as to the advantages to be derived from an American exposition to be held in St. Petersburg in 1901, immediately after the Paris exposition, as the best method of introducing and advertising goods and affording American manufacturers an opportunity to become acquainted with Russian merchants, and familiarize themselves with the kind of goods adapted to the Russian market and the methods of doing business. Such an exposition would result in the establishment of a Russo-American bank to handle American business, a commercial agency to report on the standing of business men in both countries, as well as an international express company and parcels post, all of which are essential to the proper development of trade with this rapidly growing country.

English firms give a credit of from nine to twelve months, the buyer usually accepting a draft payable at a London bank, without interest, that being included in the price. Some English firms of German extraction give even longer credits and keep open accounts with regular customers, the buyer remitting at his convenience during the year.

The custom of German firms, where money is very cheap, is to give six months' credit and frequently from nine

to twelve, while open accounts are common.

American exporters usually require payment at an American bank on the presentation of bills of lading, showing the freight to have been delivered on board of a steamer at some leading seaport in the United States, which is well enough for cotton, rosin, and such other cash articles, for which the United States is the leading market; but where there is sharp competition from England, Germany, Austria, Belgium and France, the terms offered by these countries must be met to secure business.

### EFFECT OF CARACAS WAREHOUSE

The Caracas warehouse is one of the largest and most convenient business buildings in that city. At the present time ninety manufacturers have their lines of samples shown there or now in course of shipment. In addition to these exhibits, the library in the warehouse contains catalogues of hundreds of manufacturers, all classified and indexed. The library also contains files of all the leading trade papers published in the United States, which prove of great interest to the business men of Venezuela. The attendance at the warehouse has been surprising, both as to number and character of the visitors.

Within an exceedingly short time this warehouse has become recognized as the headquarters for American goods in Venezuela. Although an active and aggressive factor in developing American trade in Venezuela, the warehouse does not occupy the position of a competitor with any of the existing business houses, but acts in the most complete harmony and co-operation with all of them. Its aim is not to divert or intercept their trade in any manner, but to aid them, and this fact has won for the warehouse the friendship and co-operation of the important business interests of that country.

Many of the manufacturers whose lines are shown are represented by resident agents, who make their headquarters in the warehouse and act as salesmen for the firms they represent; consequently, a large amount of business is constantly passing through the warehouse, being handled by these resident salesmen. In this manner it has been possible to watch the actual development of business and to trace to some extent the influence of the warehouse, although a large amount of business has been developed which cannot be traced with any degree of accuracy.

The exports from the United States to Venezuela in December, 1898, were 60 per cent greater than in the same month of the preceding year, and the warehouse in Caracas is entitled to credit for a very considerable portion of this increase.

### JAPANESE JEALOUS OF FOREIGNERS

The Japanese are attempting to imitate all civilized nations as regards government in judicial, social, naval and military matters. They are attempting to put into operation full judicial machinery with judges having no previous training. It is extremely difficult for a foreigner to accomplish what he would in other countries. Judgments attained are seldom satisfied, as in such contingencies the Jap changes his name and disappears.

The present tendency of all legislation and business is to crowd out the foreigner. It is against their law to give any government contract to a foreigner, and

it is necessary to resort to subterfuges to get around it, some of the foreign houses keeping Japanese representatives regularly at Tokio as their agents to secure government business. The typical Japanese sees no value in a contract except as it binds the other party to it.

### CHINESE AS MERCHANTS

Chinese merchants are shrewd, sagacious, enterprising and, as a class, upright and honorable. They fully realize the importance of a reputation for commercial integrity and scrupulously maintain their credit. They delight, however, in broad generalities and a bargain is a contest of wits in which the keenest wins. Generally speaking, the co-operative system is in vogue throughout the empire. Every person engaged in a trading firm, from the proprietor down to the errand boy, has his share of the profits, which are carefully graded to correspond with the position he holds.

The empire will not disintegrate, neither will it be divided up. Not that the government is incapable of being overthrown, but it is a cube, and when it capsize it simply falls upon some other face, and to external appearances, as well as interior substance, is the same that it has always been. Repeated experience of this process during the past 4,000 years has taught the Chinese that this result is as certain as that a cat will fall upon its feet.

### CHANGE IN PORTO RICAN TARIFF

The manufacturers and merchants of the United States now have for the first time equal access with other parts of the world to the markets of Porto Rico. Under Spanish tariffs a very large proportion of the imports into the island almost necessarily came from Spain, the duties on goods from that country being but a small fraction of those on goods from other parts of the world. The new tariff which went into effect on February 1 places all countries on precisely the same footing with reference to their goods imported into the island, and thus for the first time the Porto Ricans will have an opportunity of exercising their judgment and wishes free from control as to where they shall purchase.

Porto Rico offers an annual market for \$15,000,000 worth of goods, and this will be very materially increased as the conditions of the people improve and the market is judiciously cultivated by American energy and intelligence.

The Japanese are now inflated with conceit, says a Yokohama paper. The progress made by them in the past twenty years was the result of being humble and working earnestly to supply their deficiencies. With the loss of humility and the development of a conceited mood, progress has ceased.

Apparently Austria is suffering from over-production in the cycle trades. At a recent meeting of workmen dismissed from the principal cycle factories, it was stated that matters were assuming a most critical aspect.

The makers of the Acatene chainless bicycle in England have lost heavily in their trading. The company was organized in the fall of 1896 and the net loss for two years amounts to \$47,000.

## SUBJECTS OF GENERAL INTEREST

**WHERE TRUSTS ARE MANUFACTURED**

The fact has found its way into print that of the great combines organized as corporations under the free and easy laws of New Jersey sixteen have an aggregate nominal capital of \$616,100,000, or an average of over \$38,500,000 each. The scope of these aggregations to stifle competition is plainly indicated by their "national," "American" and "continental" names. They mean to be literally "the whole thing" in their respective fields. The smallest capitalization in the list—\$5,600,000—is that of the United Brewers' Company, which is too modest to pretend to be continental or even national.

These combines of 1898 find themselves in a very select circle of older ones which have the honor and pleasure of skinning the public under the laws of New Jersey. Sixteen of the earlier members of this circle have an aggregate capital of \$592,445,000, or an average of more than \$37,000,000 each.

The aggregate capital of thirty-two combines is \$1,208,400,000. The interesting statement is made that the stocks of combine corporations organized under Jersey law to the amount of more than \$1,000,000,000 does not represent a dollar of investment in New Jersey. This shows how obliging the state is in facilitating the organization of conspiracies against consumers. It should be stated, however, that the state is not altogether unselfish in this matter, for it is collecting a tax on about \$2,270,000,000 of stock representing capital of which the great bulk is invested outside of the state. During 1898 the state derived a revenue of \$2,359,198 from corporation fees and taxes, or about enough to pay the cost of the state government.

But it appears that the legislature of that state has under consideration a measure which may drive the business of manufacturing corporations into some other state. A bill has been introduced changing the tax from \$40 a year for each million of capital stock of any corporation over \$5,000,000 to \$500 for each million over \$5,000,000, or nearly six and a half times as much.

**CURIOUS RAILROAD STATISTICS**

Nearly one-half of the railroads in the hands of receivers at the beginning of 1898 were taken from the courts during the year. On January 1, 1898, according to the Railroad Gazette, there were 120 companies in the hands of receivers, owning 12,798 miles, or 7 per cent, of the entire mileage of the country, and operating 16,199 miles, or 9 per cent, of the entire mileage. The high water mark of receiverships was reached in April, 1894, when there were 210 roads, embracing 36,619 miles, or 20 per cent, of the entire mileage of the country, in the hands of receivers. On January 1, 1896, there were some 31,000 miles, or 17 per cent, of the mileage, in the hands of receivers. During 1898, of these 120 roads not less than 49, owning 6,050 miles and operating 6,639 miles, have had their receiverships closed. In addition, there have been added 18 roads during the year, owning 1,132 miles and operating 1,235 miles.

The net result is that on January 1, 1899, there were 89 roads in the hands of the courts, owning 7,880 miles and operating 10,795 miles. The mileage owned has dropped to about 41-3 per cent and the mileage operated to about 6 per cent of the entire mileage of the

country. The aggregate capital stock and funded debt under the courts at the beginning of 1898 was \$818,286,677, or about one-thirteenth of the entire railroad stocks and bonds of the country. At the end of the year the net aggregate of securities in the hands of the courts was \$568,261,144, or only one-twentieth of the railroad values.

With the Baltimore & Ohio operating over 2,000 miles, the Cape Fear & Yadkin Valley 333 miles, the Columbus, Hocking Valley & Toledo 323 miles, and other roads soon to be taken from the courts, it is not improbable that the end of this year will see the railroad mileage in the hands of receivers as low as it has ever been in the history of the country. Prior to 1894 the lowest percentage was a trifle over 4 per cent, which is about the proportion that now prevails.

**CAN CRUDE RUBBER BE CORNERED?**

Is it possible to corner the production of crude rubber? Suppose the trust people were really to buy up all Bolivia—

and it would only be a question of getting enough money together—the government would be powerless to protect them in a monopoly of rubber. The people already on the ground would claim some rights, and others would be sure to come in, without regard to the rights of the trust. Bolivia is a vast country, with a sparse population, limited means of communication, and a weak government. Under such conditions, any company which gained control of the rubber sources there through the expenditure of large sums of money would be worse off than the rubber handlers who went on buying in the old way, investing nothing beyond the amount of current purchases.

Suppose, too, that control of Bolivia should be gained by the trust; it would be only a beginning, so immense is the rubber district of South America alone. Only 4 per cent of all the rubber that comes through Para is grown in Bolivia. The Brazilian rubber belt is 2,000 miles long, and beyond that is Peru, with a rubber area that has never been measured. In all that country business methods are wonderfully complicated.

There are long established houses in the Para trade that don't know how they stand today, and that couldn't liquidate in ten years. They are making advances constantly of merchandise and provisions to operators up the river, against prospective supplies of rubber; they are receiving rubber constantly for which credit is given, but the accounts are never closed. When a partner in such a house wants to retire he sells his interest to another, who remains on the ground to look after it; if he can't sell, there is nothing to do but charge the unsettled accounts to "profit and loss" and go away and leave them. How could a combination be made of such houses? On what basis could they be brought together?

The leaders in Para rubber trade have reached their present position only after long experience, which has enabled them to know the people they have to deal with, and their peculiar trade customs, so that they are able to decide to whom to make advances and whom to refuse, and how to proceed to collect debts in a country where the courts afford no aid. A public company—such as this proposed trust—controlled by a board of non-resident directors, through salaried managers, could never conduct the rubber

business successfully, in South America or anywhere else.

The African rubber supply must not be forgotten. The production there is very large already, and seems to be growing, though it is hard for outsiders to learn anything about conditions in the interior. No one can say when the supply may begin to fail. Just now, however, immense profits are being made in Congo rubber. Shares in one of the Belgian companies having concessions for rubber in the Congo Free State, of 500 francs par value, were sold lately at 10,000 francs, and are said to pay 15 per cent on this valuation. This sort of thing cannot go on long without attracting a host of new explorers for rubber. If they can't get into the Belgian Congo territory, they have only to cross the river into French Congo, where the same kind of rubber doubtless exists.

There never will be any trouble about getting rubber so long as there are buyers for it, until rubber trees stop growing. The known rubber countries are too extensive, and the people now engaged in handling rubber have interests too diverse to render consolidation possible.

**GRAPHITE AND ITS MANY USES**

Few, even of the well informed, dream how indispensable graphite is to modern civilization. Not a single iron casting is

taken from its sand mould without the sand being first faced by graphite; not a gun projectile is cast but the steel is melted in a graphite crucible; not a tool nor a saw is made but from graphite crucible steel. Every pound of nickel, of copper, of composition metal, of brass, is cast in some way, the metal being reduced in a graphite crucible. Every printing house, for the perfection of its electrotypes, is absolutely dependent on graphite. Every electrician and every department of electrical work comes under the same tribute. Graphite lubricates friction ways, it is notably the most enduring paint pigment, and the bulk of the writing done on the globe today is done with a graphite pencil; it has ministered to the arts of peace and to the science of war. It saves labor and it proves a short cut to desired results.

Graphite is found in great abundance in the island of Ceylon, in the Indian ocean, and next in quality and quantity at the graphite mines at Ticonderoga.

**GREAT REDUCTION OF OUR IMPORTS**

Governmental statistics of the import trade of the United States in the year just ended show the smallest importation in

twenty years, with the single exception of the year 1885. The total imports for the year were \$634,958,229. This is \$100,000,000 less than the imports of 1897 and \$200,000,000 less than those of 1892. The reduction of imports is altogether in articles free of duty, the dutiable imports in 1898 being \$366,595,549, while those of 1897 were \$365,302,240, while the free articles imported in 1898 amounted in value to \$268,362,680, as against \$377,329,110 in 1897.

The reduction of more than \$100,000,000 in imports is apportioned among the great groups as follows: Articles manufactured for consumption, \$14,000,000; articles manufactured for use in the mechanic arts, \$22,000,000; articles of food and live animals, \$32,000,000, and articles in a crude condition for domestic industry, \$39,000,000.

# THE STERLING

## "BUILT LIKE A WATCH"

The True Sportsman is not satisfied with a Makeshift

Instinctively he buys the BEST regardless of a few extra dollars in cost.

His Horse and Dog are thoroughbreds—his Gun and Rod are unexcelled—and his BICYCLE is High Grade and a Standard make.

STERLINGS at \$50.00 are within the reach of every purchaser who takes a pride in being as well mounted as his friends.

Our 1899 campaign is a vigorous one and we want Energetic Agents to conduct it.

Send for our Catalog and Proposition.

### STERLING CYCLE WORKS, KENOSHA, WIS.

RECENT PATENTS

Flexible Rear Fork Connection—Featherstone's Handlebar  
—Ecaubert's New Brake—Tubeless Tire

Single Tube Detachable Tire.—Differing from the English tubeless detachable tires, this tire is made for applying to ordinary crescent shaped rims. The open side is formed so that the two edges overlap and so that the under lap may be cemented to the rim. The upper flap may be secured to the under in any of several different ways. The methods de-

scribed by the inventor include glove button fastenings and continuous lacing through eyeletted holes. All surfaces of the flaps are covered with rubber so that when the operator is closing the tire after fixing a puncture by patching on the inner wall, he can cement the adjacent surfaces of the flaps together with rubber solution and thus make the joint air tight. The inventor is A. J. Whisler, of Kokomo, Ind.

Back Pedaling Tire Brake.—The brake is a combination affair in which the braking is done both through a friction brake band acting on the sprocket and through a brake shoe acting against the tire of the rear wheel. The front sprocket is mounted on a disk attached to the crank shaft and rotates with the disk when the pedals are moving in a forward direction, the connection being through pawls and ratchets. Projecting inwardly from the sprocket rim is a flange lined on its inner periphery with cork, which forms the braking surface for a steel brake band carried by a disk secured to the hanger barrel. The expansion of the brake band depends upon the action of

pawls and occurs immediately after forward pedaling has ceased and the back-pedaling is begun. If the back-pedaling is sufficient, a small cam arranged on one of the pawls will be moved backward till it catches a stud projecting from the disk screwed on the hanger and turns the latter backward. In turning the disk backward, the connecting arm of the spoon brake pushes the latter against the rear wheel tire. The tire brake thus affords a second brake for use when the sprocket brake is not sufficient or when the chain breaks. The tire brake can also

be operated without having first actuated the sprocket brake, by back-pedaling suddenly so that the pawl cam will skip the first stud and catch a second stud on the hanger disk, which is independent of the band brake. The inventor is Frederic Ecaubert, of New York city.

Cushion Frame.—The inventor whose well known cushion-frame construction is embodied in special models by several bicycle manufacturers seeks to strengthen the rear forks against lateral strains and twists and at the same time to afford elastic coupling between the forks and hanger by forming the connection with three flat plates. Projecting rearwardly from the crank hanger is a transverse web or flange in which is cut a slot extending from one end to the other. A recess is formed in the lower lip of the flange, but is not as deep as the main slot. The round arch which forms the front end of the rear forks has a similar flange and slot, with the exception that the recess is cut in the upper instead of in the lower lip. The middle plate extends back into both slots abutting against their respective ends, but the lower plate, while it extends to the bottom of the rear slot, merely enters the

recess in the front slot and does not quite touch its end wall. The top plate enters the recess in the rear slot in the same manner. Countersunk rivets passing through the webs secure the top and middle plates at the front and the bottom and middle plates at the rear. In the center of the plates holes are drilled for the passage of a bolt which is slightly smaller than the hole and which is provided with a shoulder at the bottom of its threading, so that the nut may be screwed down tight but will still not bind the plates. This construction allows the plates to bend either way on the same general curve without undue strain on any of the webs. The inventor has also worked the same idea of a flat plate back of the hanger into a rigid frame for the purpose of giving added lateral stiffness. The patent covering the latter construction specifies a round crown for the forks, which is made in two sections, the division being made on a central horizontal plane. From the front of each section projects a flat plate. These two plates lie together when the parts are assembled and enter a slot in a flange projecting from the hanger. On the top of the upper plate and on the bottom of the lower plate central longitudinal beads joining the crown surface are formed in the plates for the purpose of stiffening the construction against vertical strains. A design patent has also been obtained

on the general form of these constructions. The inventor is C. L. Travis, of Minneapolis, Minn.

Featherstone Expander.—A shoulder is formed upon the inside of the handle bar stem, and near its top on this rests the expander by means of a flange. After the rod has been placed in the stem a ring is screwed into the upper end of the stem tube and abuts against a shoulder on the rod, thus retaining it against vertical movement in the stem. The tapered expander piece and split stem end are of the usual construction, but in order to keep the expander piece from turning in

unison with the rod when the parts are being loosened or before they are sufficiently tightened for the expander to bind, a small pin is screwed into the side of the expander taper, its projecting end engaging one of the slits in the handle bar stem. A distinctive feature of the device is the threaded cap which is screwed into the open upper end of the handle bar stem tee piece after the desired adjustment has been made, and hides the squared end of the rod from view. The inventor is Anthony Jerome, of Chicago, assignor to A. Featherstone & Co., same place.

Cantilever Cycle Saddle.—The saddle is that designed for and used on the Pedersen cantilever bicycle. It is composed of a series of cords or leather thongs attached at their front ends to an eye suitable for attachment to the forward end of the cycle frame, and at their rear ends to a curved cantle connected by a series of springs to the rear of the frame. The springs radiate from a socket to which they are attached by a curved bolt, and

spread sufficiently to steady the saddle, but not so much as to make it rigid. The inventor is Mikel Pedersen, of Dursley, Eng.

The French makers have declared that "the bicycle is now so near perfection that cycle shows are not needed." Moreover, it is added that "all the people who intend to ride are educated in bicycle construction." Both statements are very wide of the truth.

The post office authorities in Great Britain find use for 10,000 bicycles.

## NEW MOTOR VEHICLES

Light Weight Orient Electric—Tinkham Motor Tricycle—  
Hertel's Improvements in Motor and Running Gear

At the recent New York cycle show there were among the motor vehicle exhibits, besides the Pope electric carriages and gasoline carrier and the Riker electric vehicles, which have all been illustrated and described in detail in previous issues of this paper, also several new patterns which deserve more special attention than was accorded them in the show report.

## One Dollar Per Pound.

The one novelty exhibited in electrics was the four-wheeler for two passengers shown in Fig. 1, which is the first motorcycle turned out by the Waltham Mfg. Company. This Orient electric is, as shown by the engraving, a vehicle of good appearance, and its workmanship appeared to be excellent. The running gear is all of steel tubing, similar in general design to that of the Stanley

The brakes are of the band and drum variety, applied directly to the hub of each rear wheel, and are of ample power.

The battery weight is very small as compared with weights used in the Riker and Pope vehicles, but of course the light weight of the Orient wheels—only half that of the Riker and Pope average—makes a much smaller motive force sufficient. This Orient carriage is said to have a range of twenty-five miles on ordinary roads, and to be a good hill climber. The lightness of construction is not obtained by a reduction of overall dimensions, as the carriage has ample seating room, and is in every way a thoroughly comfortable road wagon.

## Two-Stroke Cycle Gas Engine.

A new explosion engine driven vehicle shown was the Tinkham tricycle, Fig. 2. The wheel base is 54 inches and the

A two-cycle gas engine is greatly desired, and it is to be hoped that the Dennison may prove to be all that is claimed for it.

Like all other motorcycle exhibits at the Garden, this Tinkham tricycle attracted great attention, crowds of spectators constantly surrounding it, eager for information in motorcycle matters.

## Accessible for Inspection and Repair.

The Hertel explosion engine driven wagon, built and shown by the Oakman Motor Vehicle Company, Greenfield, Mass., of which a side view and maker's description are given on page 320 of The Cycle Age, issue January 12, embodies original features at almost every important point of construction, and is evidently the result of independent thought long continued. In many directions this wagon is theoretically superior to anything else yet shown, and one extremely meritorious practical detail is to be found in the very complete exposure of, and access to, every part of the machinery, gained by simply raising the sheet metal tail board, as shown in Fig. 3. The tail board is supported in its elevated position by rule-jointed pivoted metal bars, and the mechanism is all disclosed, so that any part can be readily reached with a wrench or screw driver by a per-

FIG. 1.—ORIENT ELECTRIC CARRIAGE.

FIG. 2.—TINKHAM GAS ENGINE TRICYCLE.

steam wagon, which was fully illustrated in these pages a short time since. A peculiarity of this Orient frame consists in fitting the middle parts of the top side bars to turn in the end sections; this gives the frame sufficient twisting flexibility to enable the wheels to accommodate themselves to road surface irregularities. The weight of this wagon is 1,000 pounds, and the price is \$1,000.

The particulars of the Orient electric are as follows: Wheels, suspension; Fairbank's laminated wood rims, 32 and 34 inch diameter; rear wheels driven; front steering wheels, on the usual short pivoted axles; all wheel bearings on balls; the tires are 4 inch diameter, by Morgan & Wright, and can be furnished for \$100 per set of four. The wheel base is 60 inches and the gauge is 48 inches. The air pressure is 100 pounds. The batteries, by the Chloride Company, Philadelphia, weigh 550 pounds, and can be replaced for something under \$300. The motor is by Riker, 8-10 K. W., and weighs 100 pounds. The gear reduction from the motor shaft to the compensator gear disk is 8 to 1. The compensating gear is a special design by President Metz, of the Waltham Company, and is spoken of as a decided advance in the construction of that important detail.

gauge is 30 inches. The wheels are all 28 inch diameter and the pneumatic tires are 2½ inch diameter; price, \$15 for the set of three. The motor has a two-stroke cycle, and was designed and built by J. F. Dennison, New Haven, Conn. There have been many attempts made to produce a satisfactory explosion engine working on a two-stroke cycle, commonly written "2-cycle," but so far none of the two-cycle explosion engines have proved entirely satisfactory. Mr. Walton, who gave the information in regard to the details of this Tinkham tricycle, did not explain the construction of the Dennison engine to the writer, more than to say it was two-cycle, and had no puppet valves, a single disk valve, secured to and revolving with the engine shaft, answering for both cylinders. These cylinders are located opposite each other, are on each side of the engine shaft, and give one turning impulse for each half-turn of the crank shaft. The usual chain and sprocket transmission is introduced between the pedal crank shaft and the engine shaft, for starting the motor, and a pinion on the engine shaft meshes with a ring of internal gear on one driving wheel. The price of this tricycle is \$500. The Tinkham company will build all styles of automobiles.

son standing on the ground. This is in strong contrast to the French automobiles, the machinery of which is accessible only to a man lying flat on his back, underneath the wagon, a most unsuitable position for working comfort and cleanliness as well. This ready access to all of the mechanism is a very strong point in Hertel's favor, as it enables attention to be given to the machinery on the road by a man standing squarely on his feet and working at a natural height.

## Wheels Conform to Road Surface.

Perhaps the most original feature of Hertel's running gear is the independent wheel support given, which enables any one of the four wheels to rise or fall a considerable distance, without raising or lowering any other part of the mechanism.

This independent wheel rise and fall is obtained by mounting each wheel on an axle carried on the free end of a pivoted spring-controlled arm, so that the wheels rise and fall independently of the wagon frame. While these swinging axle supports do not give the eye an impression of superabundant rigidity of wheel axle support, Hertel states that in all of his five or six years of experience with it on the road he has never seen the smallest

indication of weakness in this direction.

Hertel obviates all the difficulties of the gear case by using V-grooved friction pinions, 3-inch pitch diameter, on the ends of his countershaft, which internally engage leather covered metal rings, 28-inch pitch diameter, secured directly to the driving wheel rims, thus greatly relieving the wheel spokes from tangent stress. This friction drive is still; it is also unaffected by road grit, and it is applied so near the wheel tread as not to require much pressure to make it drive efficiently, and it can be thrown in and out of action instantly, without noise or shock.

#### Description of Motor.

The Hertel motor is a pair of Otto-cycle explosion engines, 4 inch bore and  $4\frac{3}{4}$  inch stroke, both cylinders cast in one piece, as close together as possible, and both pistons working on one crank; the explosions alternate, so as to give a turning impulse during one-half of each turn of the crank-shaft. The clearance is  $2\frac{1}{2}$  inches, or something more than half the piston displacement. The large clearance makes a low compression, and gives, of course, a low initial pressure and a "soft" action. The cylinders are water jacketed over the extent of the piston-ring travel only; this gives the

inch spiral spur gear on the crankshaft which meshes with a 3 inch spiral pinion on the countershaft; this makes the total reduction from the engine shaft to the driving wheels about 41-3 to 1.

The wheels are 26 and 36 inch diameter, suspension; steel rims and ball-bearing hubs. The gauge forward is 33 inches, rear 45 inches, and the carriage will turn in a 10-foot circle. The tires are pneumatic,  $2\frac{1}{2}$  inch diameter, by the Newton Rubber Company, and cost about \$50 for the set of four. The total weight of the Hertel wagon is 475 pounds and the price named is \$750.

The Oakman Company is said to be ready to supply these wagons at short notice. The Hertel wagon has no geared speed changes; the speed is governed by regulating the volume of the explosive charge, which is effected by turning the handle of the brake lever; by this means the engine revolutions can be varied from 160 to 800 per minute.

### EXTRAORDINARY ROAD SPEED

Action of Electric Wagons Traveling Over Forty Miles an Hour—High Horse Power.

Further details at hand regarding the match contest between the Jenatzy and

ometer, flying start, and 2:09 for two kilometers. At pistol fire his carriage shot forward at a terrific pace. The spectators at the winning post could see the black mass rapidly approaching in a perfectly straight line and running as steady as a locomotive. It flashed by the winning post, and so powerful were the brakes that it stopped almost immediately the tape was crossed. The times were as follows: For the kilometer, standing start, 1:08; for the kilometer, flying start, :54; total for the two kilometers, 2:02.

Three records were thus broken and it then remained to be seen whether the count could better his opponent's performance.

The count's carriage had not the same steadiness as Jenatzy's and appeared to be more difficult to guide. It went thundering along the road at a breakneck pace, and it looked every now and then as if it would jump right up into the air. About 250 yards from home there was a sudden slackening in the velocity, and when the tape was reached the speed was barely twenty-five miles an hour. A shower of green sparks under the carriage and a strong smell of something burning indicated that something had gone wrong with the motor. In spite of this accident, the time for the last kilometer was :51 1-5, which gives an average speed of more than seventy kilometers (about forty-four miles) per hour, and showed that at half distance the speed must have been extraordinary.

The official figures for the count's performance were as follows: For the kilometer, standing start, :51 2-5; for the kilometer, flying start, :51 1-5; for two kilometers, :1:47 3-5.

The count is an authority on steam and petroleum motors and is now trying his hand at electricity. His carriage has a 36-horse power motor, but in ordinary work the release of the accumulators is equal only to 6 horse-power per hour. In the race he used 32 horse-power, and it is therefore easy to understand how he got "a move" on his carriage.

The return speed contest between the Jenatzy and Count de Chasseloup-Loubat electric road vehicles is to be run within a week or two and is being awaited with keen interest in France.

#### Automobile Cabs for Chicago.

It is said that twenty automobile hansom cabs owned by the Croker-Leiter combination will soon be in operation in Chicago. These cabs will be similar in construction to those which will begin running in New York next month. It is understood that the rate of fare in both cities will be three cents a mile. The plans of the cab line in Chicago are to avoid the downtown district as much as possible and seek fares along the boulevards and highways of the parks. Tallyho coaches driven by electricity will also be operated in the parks, the circuit of the entire Chicago park system to be traversed in  $1\frac{3}{4}$  hours at a low rate of fare.

#### Boilerless Steam Motor Carriage.

A number of citizens of Cincinnati are interested in a new motor carriage to be propelled by steam which is being perfected in that city. The engine differs from any other steam engine, as it has no boiler, the steam being generated by the flash system. The motive power consists of a generator, 10x5 inches, and two rotary engines, 8 inches in diameter, which constitute the entire mechanism, while the fuel supply is contained in a water and oil tank under the seat. The inventor claims that it will run up or down hill with equal ease, and that any person can operate it.

FIG. 3.—HERTEL CARRIAGE—TAIL BOARD RAISED.

cooling water little to do, as the explosion chambers are left to assume their natural temperature, the low compression obviating the liability of premature explosion.

The amount of water carried is only six gallons, and Hertel asserts that this water does not reach the boiling point, and hence, as it circulates in a closed system, does not give out steam nor require replenishment.

The ignition is electric, from a dynamo which is driven by the engine shaft, and delivers its current to a storage battery, whence the sparking wires are led. The weight of the dynamo is 22 pounds, and that of the storage battery is 14 pounds. This arrangement gives a sure spark, whether the dynamo is operating at the instant or not, and enables the driver to start the motor in action from the seat with perfect certainty.

#### Gear Arrangement.

The counter-shaft, which carries the driving wheel friction pinions, carries also a 24-pound flywheel, and is geared up to over 2 to 1, by means of a  $6\frac{1}{2}$

Count de Chasseloup-Loubat motor road wagons, as published in Cycle Age last week, furnish the information that both were electrically driven, that the match was for the gold medal of the French Automobile Club, of which both gentlemen are members, and that a great deal of interest in the event was manifested by the automobile enthusiasts, who journeyed out to Poissy, where the race was run, in large numbers.

The Jenatzy wagon has seen some hard road service and had previously won several contests for hill climbing. The count's carriage had been in use for some time also and last year took first prize in the kilometer race for autocars organized by the French Automobile Club.

Each vehicle was allowed only one trial, but times were taken as follows: for first kilometer, standing start; second kilometer, flying start; two kilometers, standing start.

Jenatzy lost the toss up and had to start first. To win he would have to lower the records, which were 1:12 for the kilometer, standing start, :57 for the kil-

GARFORD

HUNT

BROWN

## Guarantees

**W**E imagine that the average dealer gets awfully tired of having to bolster up little-known goods with a guarantee. He must labor to convince that they are safe to buy; that no risk is run because "money will be refunded if not satisfied," etc., etc.

How much better to handle goods that need no long-winded, brain-cudgelling argument to sell, above all, goods that don't have to be lied about; in other words Garford-made goods that sell themselves.

All we ask is that dealers will *tell the truth* about our saddles—if they can find anyone who does not already know about them.

# INFORMATION FOR BUYERS

## THE M. & W. "LANCASTER" GAS LAMP.

The Matthews & Willard Mfg. Co., of Waterbury, Conn., having salesrooms at 40 Murray street, New York City, is just sending to the trade an attractive bristol board hanger bearing a life size artotype of the new "Lancaster" acetylene bicycle lamp here illustrated. The reproduction on the hanger is so faithful a picture and yet so delicate that it must attract instant attention and prejudice the mind in favor of the goods.

By separating the water reservoir, combustion chamber, and carbide chamber so far from one another all the parts are kept

cool and all the gas generated is used in illumination, none being wasted in heat. The generator is scientifically constructed. By the use of a new patented water trap and gas seal unsteadiness of the flame is claimed to be rendered impossible, the lamp giving a steady light even when standing still, and the jarring of the bicycle in motion not being needed to make it work. The water valve affords complete control of the flame, graduating it instantly at the will of the rider from a very small to a large, broad flame. A quarter-foot fishtail burner is used, and it is readily removable for cleaning. The carbide is placed in a corrugated holder, which is so constructed that it facilitates the dissemination of water or gas, and is very easy to clean. It can be filled or emptied instantly.

With a full charge the lamp will burn more than five hours. As it is not necessary to use carbide specially prepared or put up in special packages, the lamp can be charged so as to burn a shorter time if required. One pound of carbide will give 20 hours' light.

## IMPROVEMENTS IN COLUMBIA CHAINLESS.

While in principle the bevel gear mechanism of the Columbia bicycle, manufactured by the Pope Mfg. Co. of Hartford, Conn., remains the same as formerly, the latest pattern has some important changes which tend toward more accurate running of the gears and pinions and toward the reduction of weight. The new design allows the use of smaller gear covers and of narrower rear forks and hub. Of greater importance, however, are the changes in the arrangement of the gears and pinions themselves. The forward mechanism which was formerly assembled directly into the crank bracket is now placed in an independent

sleeve which is inserted in the bracket and there clamped in position. The gear adjustments have been made entirely independent of the bearing adjustments, both at the front and rear. All of the gears and pinions bear in the line of thrust, the ball races of the several gear supporting bearings forming a part of the gears themselves. The right crank shaft bearing, which was formerly inside of the large driving gear, has been carried to the outside and placed at the periphery of the driving gear, thus giving a large diameter ball race such as has never before been used in cycle construction.

This last change greatly reduces the liability of the forward gear springing out of proper mesh with its pinion and at the same time reduces the weight of material necessary to properly support the parts. Provi-

sion has been made for the quick adjustment of all the gears independently of each other, thus greatly simplifying the operation of bringing the gears into mesh.

## PROGRESS OF WALKER & EHRMAN MFG. CO

The Walker & Ehrman Mfg. Co., Washington and Union streets, Chicago, has passed its fourth anniversary in the manufacture of bicycle parts and fittings and is justly proud of the fact that it has enjoyed a steady growth since its birth. The original W. & E. factory occupied but a small corner in a manufacturing building and employed but half a dozen men and boys. Now the floor space occupied is nearly 100,000 square feet and the pay roll includes nearly 200 men. The proprietors are young men and have conscientiously pushed their business and honestly endeavored to turn out nothing but first-class work, with the result that W. & E. parts today are widely recognized as possessing unusual merit and reliability.

The company's line of hubs is quite notable because it not only includes these parts for singles and tandems of ordinary construction, but embraces as well hubs for racing machines and for triplets, quads and other multiplets. The W. & E. Special hub is the latest of the firm's creation in this line and, as will be seen from the illustration, adjusts by means of the cups which screw into the barrel. The cones screw on to the axle, but abut against the ends of a light sleeve slipped on over the axle and are thus held from moving after having been once screwed tight into position. The locking arrangement for the cups is similar to that which has been used for some time on W. & E. crank hangers and is positive in its action, the security of the cups not depending upon the binding power of locking nuts. The racing hubs are light, carefully designed, and of standard three-point cup

and cone design and free from contrivances which add weight without lending ease of running. The tandem hubs are furnished regularly in two chain lines and will be made to order with almost any chain line desired. They are made of the same material and in the same general manner as the single hubs and are guaranteed by the company to give the same satisfaction.

The leading feature of the W. & E. pedal is the form of the forged center frame, the cross bars of which have a neat and striking diamond shape—a new departure from the usual round or flat cross bar. The cap on the outer end of the barrel is knurled around the edge, as well as slotted for screw driver, so that if desired it can be screwed tightly into place with the fingers. The shape of the stamped frame plate is original and enough different from usual shapes to give the pedal a distinctive appearance. In the line of head and handle bar fittings the W. & E. company offers as original products its expander and its rear handle bar clamp for single steering tandems. Both of these fittings are here illustrated. The tandem clamp fastens directly to the rear top tube of the frame and has a short upward projection which receives the handle bar stem in the usual manner, though instead of being secured by bolt or set screw the bar is held by an expander, making the exterior appearance of the fitting clean cut and neat.

The company handles the Fauber one-piece hanger in addition to selling its own two-piece hanger, and thus meets both requirements among hanger purchasers. In the W. & E. hanger the left crank and axle are made in one piece and the right crank is secured to the end of the shaft by means of a taper seat and end draw screw, the head of which comes flush with the outer

face of the crank. The hanger is furnished in both regular and eccentric brackets. A full stock of standard handle bars and seat posts is carried by the firm, which also makes a seat post that may be readily changed from a front to a rear L by the loosening of one screw. This post is here-with illustrated. In frame sets and fittings a wide range is offered, including parts for building frames of all of the present popular styles. The fittings are offered both in machined drop forgings and in steel castings. All the fittings for multiple frames match the angles of Fauber hangers. Shelby tubing and front and rear forks and stays are carried in stock, as are also the Wire Goods Co.'s spokes and nipples. The head fittings for singles and tandems are

all turned from solid steel stock and are intended for use on high grade machines.

The company has recently engaged the services of J. E. Smith, who for several years past has acted as purchasing agent of the Monarch Cycle Mfg. Co., and who in his new position will doubtless prove a valuable assistant because of his wide acquaintance among manufacturers and dealers in parts and supplies.

## THE CROWN DETACHABLE CHAIN.

The breaking of a bicycle chain on a country road usually precedes a series of events more or less disagreeable according to circumstances, such as the distance from the nearest town or repair shop, whether or not the rider has a file and punch and extra links and rivets, and whether the walking is good or bad. All possibility of such unpleasantness is obviated by the use of a chain composed of detachable links, like the Crown Detachable chain here illustrated. With such a chain one has but to carry an extra link or two, with rivets, to be provided for any emergency that may arise through chain accidents, for a broken link may be replaced with a new one by the use of the fingers alone, anywhere upon the road. In the same way it minimizes the trouble of lengthening or shortening the chain when altering the gear of the machine, or of taking up slack due to stretching of the chain.

The principle of the Crown Detachable chain is not a new one and is plainly understood from the illustration, but the Thorsen Co., 56 Fifth avenue, Chicago, which is selling agent for this chain, made by the Crown Electrical Mfg. Co., of St. Charles, Ill., claims superior quality and finish for these chains. They are all made in B block pattern with flat tops, are 3-16 inch wide and made in four styles, as follows: No. 110, straw color hardened blocks bright side plates; 125, straw color hardened blocks, finely polished, blue side plates, fine revol-

ver finish; 130, white color hardened blocks, finely polished, blue side plates, fine revolver finish; 150, finely blued and polished blocks, polished and nickel plated side plates.

## UNITED SPECIALTY CO.'S TIRE INFLATOR.

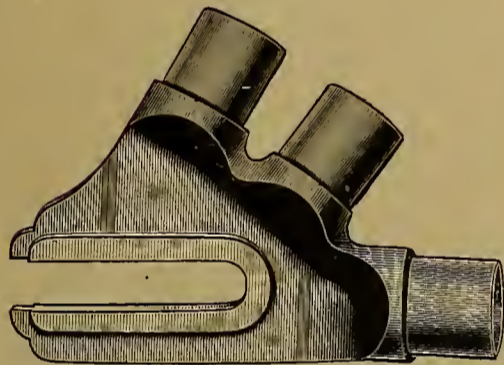

This cent-in-the-slot machine offers an entirely new solution of the tire inflation problem, at either high or low pressures, and can be made available for the 100 or 125 lb. pressures which are used in pneumatic motor vehicle tires and are difficult to obtain by ordinary tire inflating machines.

This inflator consists of a hexagon pillar rising from a cast iron base, and surmounted by a copper cap. The sides are made of enameled plates, blue, with white lettering, retained by copper corner strips. The base and middle band and the cap-support are

**WALKER & EHRMAN MFG. CO.**

WASHINGTON AND UNION STS.

**CHICAGO**

bronzed, giving the structure an attractive appearance. From the front side of the machine a small tube projects; this tube is bent upward at right angles, and has a cup at the top end, in which the air valve tube of the tire is placed after removing the cap. There is no hose and screw connection to be made in bicycle tire inflating. All that is necessary is to hang the cycle on the pressure tube, as shown, and then drop a cent in the slot. The machine blows a tire up to 45 lbs. pressure in about 20 seconds, and this pressure cannot be exceeded. If less pressure is desired the wheel may be taken off at any time.

Inside the pillar there is a steel bottle of liquid carbonic acid gas, at a very high pressure, and a steel tank, about 8 in. in diameter is connected to the gas bottle through a reducing valve, this tank or receiver being always filled with carbonic acid gas at 45 lbs. pressure. It is the intention of the United Supply Company to place a great number of these inflating machines at points frequented by cyclists. No attendant is needed, as the pressure is always there, and any cyclist can hang his wheel on the delivery tube as shown and drop a cent in the slot, and the machine does all the rest.

By adjusting the reducing valve, the pressure can be made 100 or 125 lbs., instead of the 45 lbs. demanded for cycle tires, and hence this charging machine becomes available for motorcycle tire inflation, without the slightest difficulty of any sort. For moto-

ten patterns in colors to match frames, and the bringing out of the new "Lenawee Flush" handle bar, which will be furnished regularly on four models of the line. The three Hudson patterns will be equipped with either the Claus or the Sanger adjustable bar.

#### DIRKSEN ADJUSTABLE HANDLE BAR.

This handle bar is adjustable without the aid of tools or wrench and may be changed from one position to another while the rider is on the machine. The locking device is

original as applied to bars, consisting of a transverse screw which actuates an inclined plane block that in turn raises or lowers the binding block proper. The last acts on the annularly grooved bar tube center. A half turn of the thumb screw to the left unlocks the bar and an equal turn to the right locks it in its new position. The bar is furnished in several of the popular shapes and will be supplied with stem of any desired size. It is manufactured by the Dirksen Handle Bar Co. of Hornellsville, N. Y.

#### CONTRACTS FOR HALF A MILLION BARS.

Some idea of the immense volume of business done by the Chicago Handle Bar Co. can be obtained by noticing their large purchases of Shelby seamless tubing. Another car load containing 150,000 feet was shipped from Shelby Jan. 31 and consigned to the big Chicago concern. This makes the third shipment for the requirements of the current season. President Webster reports that the outlook for business is exceptionally good, contracts having been closed for upward of 500,000 bars.

Speaking of brazed bars, Mr. Webster says: "Their use will not be satisfactory. The trade is becoming most exacting and every detail in the way of equipment must be beyond criticism, particularly as to finish. This applies as well to cheap as to high grade products. While in no way prejudiced against brazed bars, or disinclined to furnish the trade with whatever may be specified; yet experience will demonstrate that brazed bars cannot be made to the standard which the trade will demand. Moreover, there is no material difference in the actual cost to the bar manufacturer in producing either, notwithstanding that the cost of brazed tubing is less than one-half that of seamless material."

#### DRILL FOR HAND OR BELT POWER.

Many cycle repairs shops now have light power such as that afforded by gasoline engines or electric motors, and consequently

in buying drill presses the proprietors are apt to call for a drill which has pulleys for power driving but which is still small and light and not so expensive as the pretentious machine shop drill press. To meet such demands the Silver Mfg. Co. of Salem, O., rigs

up its Advance drill, No. 12, which is designed to be operated by hand power, with tight and loose pulleys, making it a complete and reliable power drill press. This drill and its mate without the power pulley attachment are shown in the accompanying drawings. The drills weigh but 125 pounds each and may be attached to a post or side wall. The spindle is one inch in diameter and has a run of 3 inches and is bored to take 1/2-inch round shank drills unless otherwise ordered. The press drills to the center of stock up to 15 inches in diameter, and any size hole up to 1 1/4 inch.

#### SIMPLEX AUTOMATIC GAS LAMP.

Simplicity, durability, regularity of operation, absolute safety and reliability are the strong features claimed for this new lamp, which is being brought out by the Hine-Watt Mfg. Co., 16 North Canal street, Chicago, makers also of the Octagon gas lamp shown at the Chicago cycle show. The construction and operation of the Simplex is made plain by the accompanying sectional drawing. The cylindrical body of the lamp is independent of the combustion chamber and reflector, which are riveted to the spring clamp that passes around the cylinder on both sides and fastens to the lamp bracket by means of a thumb screw at the back. The cylinder is prevented from dropping out by the engagement of the head of the rivet at the rear of the reflector with a depression formed in the cylinder and by the binding friction of the spring steel clamp.

The water reservoir occupying the upper half of the body of the lamp is provided with a diaphragm near the top to prevent the water splashing up against the top and leaking out. This diaphragm has a central perforation to permit the water poured

through the screw capped opening on top to find its way downward into its proper chamber. A needle valve of special construction allows the water to drop through the central diaphragm to the carbide beneath. The carbide chamber is provided with a cup having a new form of water distributor, made of perforated metal plates designed with a central perpendicular socket or tube to fit over a pin fixed upright in the center of the cup and covered with absorbent fabric. This plate extends diametrically across the entire cup and serves to draw the water by capillary attraction to the outermost edges of the cup. The bottom of the carbide chamber is closed in the usual manner by a screw cap or base having a rubber ring to make the joint air tight.

It will be noted that the end of the needle valve extends downward a short distance between the water distributing plates and is thereby secure from dust and dirt from the dry carbide, and when the carbide cup is in place the surrounding space is also shut off against dust, which therefore cannot enter the burner. The gas tube enters this space from the outside and is provided with a valve and a new patented tip especially suited to use in bicycle gas lamps. The gas tube connecting with this tip is bored with an orifice directly below and coincident with the opening in the tip so that air enters below and mixes with the gas before it leaves the lava tip, thus insuring perfect combustion and giving what is claimed to be the strongest and most regular flame obtainable with this type of burner.

The reflector is of the parabolic type, constructed on scientific principles and is removably held in position by means of a spring wire ring. The crystal is retained in the same manner.

In operation, the water valve is simply opened two turns of the handle at the top of the lamp and not again changed until it is desired to refill the lamp. The size of the

cycle tires, however, a hose and screw connection will undoubtedly be required.

The address of the United Special Company is 47 Great Jones street, New York, and as there is no question about the action or reliability of this new inflator, the machine seems likely to be of interest to many persons.

Carbonic acid gas is by-product of all breweries, and hence the only cost of liquid carbonic gas, which is in very common use for freshening malt liquors on draught, and can be obtained everywhere, is cost of compressing to liquefaction. The steel bottles are used over and over again, and empty ones can be exchanged for full ones almost anywhere in the civilized world.

Should the pneumatic tired motorcycle come into general use, this carbonic acid gas inflator offers a very ready and inexpensive means for obtaining the heavy tire inflation pressures which will be in demand.

#### CHANGES IN THE HUDSON LINE.

The Bean-Chamberlain Mfg. Co. of Hudson, Mich., announces by circular that since going to press with the second edition of its advance catalogue it has made several changes which add to the appearance and value of the line. A new 30-inch wheel machine has been added to the line, it being of the same grade as the Lenawee machines and listing at \$45. Other points embraced in the changes are the furnishing of the company's special one-piece hanger on several additional models to those formerly catalogued, enameling the rims on all of the

flame is regulated by the gas cock, and the length of time the lamp will burn depends on the size of the flame. Water will not flow except when this valve is open and gas is being consumed, the flow being automatically regulated by the pressure of the gas in the carbide chamber. Thus the gas can be turned off and regulated at any time. In charging this lamp, the carbide cup is filled to the top, there being no retaining or compressing springs, and it is claimed there is no difficulty in removing the exhausted charge.

#### THE BARNES COASTER AND BRAKE.

The Heinz & Munschauer Cycle Works of Buffalo, besides making the H. & M. one-

piece crank hanger, the construction of which is shown in the accompanying illustration and which is furnished with brackets for regular and three-crown frames and for various drops, is now manufacturing the Barnes coaster and brake. The exterior appearance of the brake is illustrated in the lower drawing. The device is so constructed that a slight back pressure releases a sprocket clutch and allows the machine to run independent of the cranks. Further back pedaling sets the brake, which acting on a braking surface attached to the front sprocket instead of on the tire, does not give the tire unnecessary wear. All parts of the brake are of metal neatly finished and clustered at the hanger in a way that does not mar the appearance of the bicycle. The company

is prepared to furnish the H. & M. hanger fitted with this brake, and will quote prices upon application.

#### THE RALPH TEMPLE LINE.

Ralph Temple, 204 Thirty-fifth street, Chicago, has just returned from a five-months' trip through European countries. In spite of the congested state of the cycle market in England and the northern continental countries, he states that he succeeded in doing a more satisfactory business than the average American traveler in foreign lands. The experience gained through his many European tours, first as a racing man on the ordinary and later in the furtherance of his export business as a bicycle maker, has been of the greatest assistance and is principally responsible for the success he has invariably met in his recent trips. Knowledge of the language and traits of character of the peoples with whom the foreign traveler desires to do business are a distinct advantage—a fact the German manufacturers are fully

cognizant of and which they make use of in pushing their export business.

The Temple line of bicycles is comprised of the following:

Temple Extra Special, having three-crown frame, nicked joints, Thor fittings but with Fauber hanger, built with both 28 and 30-inch wheels, but only in diamond frame for men.

Temple Scorchers, made in both diamond and drop frames; three-crown construction, one-piece hanger. The model for men is made in both 28 and 30-inch wheel sizes; that for women only with 28-inch wheels.

Superb, made only for men, and fitted with 28 and 30-inch wheels.

Superba, for women, fitted only with 28-inch wheels.

Faultless, made in both diamond and drop frames, but fitted only with 28-inch wheels.

No list prices are quoted on any of these, but they will be sold to agents at a net fixed wholesale price, stripped. Equipment will be furnished if desired at the factory cost with the expense of fitting added.

In addition to the above bicycles, a line of pedals of the Record pattern and an acetylene gas lamp called the Magic will be put in the market.

#### DISTRIBUTORS FOR AUTOMATIC CHAIN BRUSH.

The Cycle Syndicate, 320 Broadway, N. Y., is export agent and eastern and southern distributor for the Automatic chain brush made by the Automatic Chain Brush Co., of Chicago, and solicits correspondence with regard to it from these sections of the United States and from abroad. This chain cleaning device was exhibited at the Chicago and New York cycle shows, where it met with much success, and will be shown at the coming bicycle exhibitions in Philadelphia and Washington. The Cycle Syndicate is confident that it will prove a good seller.

#### NEWARK NO. 7 STAMPED CLAMP.

The all steel stamped saddle clamp here illustrated is made by the Newark Cycle Specialty Co. of Newark, N. J., from 14 gauge sheet steel at a saving in weight over the ordinary clamp of from two to five

ounces. No castings whatever are used and very emphatic claims are made for its superior lightness, strength and appearance. As plainly shown by the engraving, it consists of but three pieces and the bolt. It can of course be reversed to bring the nut below the springs where it will be easily accessible. It has been designed, according to the makers, especially for use on export machines, and it is pointed out that it will increase the export sale of the saddles on which it is used.

#### EXERCISERS AS A SIDELINE.

Bicycle dealers who are looking for side lines which will at once be profitable and will not make necessary large outlays of capital will be interested in the proposition of the Manhattan Web Co., Grand street and Market place, New York city. The company makes two styles of exercisers, the Manhattan and the Hendrickson, each of which is offered in several patterns at different prices. It is claimed by the company that this is the only house in the country which can make reliable first-class exercisers at the prices for which its goods sell, because it makes its own elastic cables.

In order to obtain a country-wide reputation and sale for its exercisers the company will send on consignment to one reliable dealer in each city a fair sized and complete stock of the exercisers, provided that the dealer will agree to mail each week to the firm an account of stock on hand and will remit for the exercisers sold. It is claimed that these make a first-class side line because if a young man is placed in the window to show the various movements possible direct trade in exercisers will not only be obtained but new customers for other goods will be drawn to the store. The goods so consigned will, of course, be subject to the call of the company, but will be left with the dealer as long as the very reasonable agreements are kept.

#### CHAIN RIVETER FOR REPAIRMEN.

When a broken chain is taken to the average repair man, his only method of heading the rivet is by the usual hammering. This

sometimes results in bending the body of the rivet and causing the link to bind. The McCabe Hanger Mfg. Co., 540 W. 22nd street, New York, has just placed on the market the Zamboni bicycle chain riveter, which is here illustrated. It is designed as a convenient, low-priced tool for repairmen, and overcomes the difficulties arising from the misdirected blows of a hammer. The rivet is first upset by the ram at the left, by a blow of a hammer. It is then passed to the other ram, the die of which is quartered and cup-shaped, with a lower die plainly cupped. This finishing ram has a ratchet cut wheel or gear, which, in connection with the side

spring, turns the heading die one-ninth of a complete turn at each blow, so that the head is put on uniformly. The rams are lifted automatically by the springs after each blow. The riveter is formed so that it can be held in the jaws of a vise.

#### COPPERED AND NICKLED SPOKES.

Spokes which will not suffer in appearance as a result of inclement weather are now being made by the Excelsior Needle Co. of Torrington, Conn., the western branch of which establishment is conducted by Frank Odell at 204 Lake street, Chicago. After many experiments on the part of the firm's chemist, bicycle makers are now being supplied with nicked spokes which, subjected to the severest tests, have proven highly satisfactory. The spokes are nicked twice and buffed three times on a copper surface. Excelsior spokes bear the firm's trade mark—Diamond E.

#### STRAUS GRIP PROTECTOR.

The Straus Tire Co. of New York city is introducing a novelty which will be readily

appreciated by all who have marred or broken their handle bar grips by letting the bicycle fall to the ground or against a wall. The article is shown in the illustration. Its principal use, that of protecting the end of the grip, is supplemented by its utility in protecting the entire bicycle at times against fall. The protector being made of rubber will, when the bicycle is leaned against a wall or post, keep the machine from sliding backward and falling to the ground.

#### FEATURES OF NEW DEPARTURE GAS LAMP.

The separation of the generator and gas chamber from the combustion chamber, insuring a cool gas supply to the burner and safety from overheating, is the dominant feature of the New Departure gas lamp now being manufactured by Joseph Lucas & Son Co. of Bristol, Conn. In this lamp the metal cylinder containing the water reservoir and the carbide chamber attaches by

means of spring clips to the lower main tube of the bicycle frame, and the reflector and lens comprising the combustion chamber are supported adjustably in front of the head of the machine on a gas tube leading to the burner. The gas, generated in the lower chamber of the cylinder, has to pass through the water in the reservoir before entering the burner, thereby being washed free from impurities, thus securing the highest illuminating power with the least gas. Provision is made for simply, quickly and effectively freeing the gas chamber and burner from dirt or deposit by attaching an ordinary hand or foot pump to a small nipple underneath the reflector hood and forcing air through the passages.

Loose or broken carbide is used, no special form of charge being necessary, so that in operation this lamp is made convenient, reliable, safe and economical. The New Departure lamp is made of the best materials by skilled workmen. It is supplied to the trade by John H. Graham & Co., 113 Chambers street, New York City.

**IMPORTANCE OF "FILLING" A CHAIN.**

There is as much to be gained by "filling" a chain as by cleaning it. When a chain is thoroughly cleaned by the use of kerosene the grease is not only removed from the surface, but from the rivets and holes through the blocks. Graphite never reaches the rivets, and the chain is dry. The friction in the rivet holes of an ordinary dirty chain that has never gone through kerosene, is probably not as great before the

cleaning as afterwards. The chain, of course, was full of grit between the working parts, but this grit may not have reached the rivets, although it was cutting the sides of the links, etc. The washed chain, therefore, that is not filled with some good lubricant is often not as good a running chain as before it was washed. A chain, therefore, with dry rivets, is not only a hard chain to drive, but it is a chain which is rapidly wearing itself out. It is more important to lubricate the rivets than the outside of the blocks of the chain.

The problem is to arrest the wear and reduce it to a minimum. To do this the grit must be removed by washing and the chain then lubricated with a heavy body grease, that will remain in the joints a reasonable time and also form an armor or protection to the joints against the readmission of grit. A chain, dipped in hot tallow and passed through it until the chain is warm, will "fill." The tallow will also remain on the outside of the chain to a considerable extent when the chain is withdrawn from the grease. This hardens as it cools, leaving a coating all over the chain, as well as filling every joint.

The accompanying drawings show the patent chain cleaner, operated by a crank, made by the American Bicycle Chain Cleaner Co., 106 Beekman street, New York city, which concern has given much study to the question of chain wear. The apparatus is intended to be fastened to a wall or other support.

**MACHINES AT JOBBERS' PRICES.**

In the catalogue of the Chicago Tube Co., which concern manufactures and jobs bicycles, bicycle materials and supplies, dealers are invited to pay attention to the fact that the firm supplies goods at jobbers' prices, that is to say, a calculation has been made concerning the price at which the firm would sell jobbers from one to five thousand bicycles and the same quotation is made to agents. It is urged that in order to buy

good wheels at low prices this season it will be necessary for agents to purchase from first hands, jobbers' profits being a hindrance to sales. Frame sets and frames, complete and stripped bicycles, sundries and tools of all descriptions are described in the catalogue.

**RUBBER NECK RACING SADDLE.**

The Bunker Saddle Co., 65 Milwaukee avenue, Chicago, has just recently put in the market the trim little form racing model

of Rubber Neck saddle illustrated in the accompanying drawing. It comprises a metal stamped base, the honeycomb molded rubber cushion which is the distinguishing feature of all Rubber Neck saddles, and a leather top. The pommel is long and narrow, the seating surface of comfortable shape, and at the extreme rear the cantle is projected upwardly to form a high back. The length is 11 inches and the width 7 1/2. Owing to its peculiar form the saddle may be placed more nearly horizontal on the machine than the ordinary racing model, the rider having the extension of the cantle to push back against when not sprinting. This model is equipped with plain wire springs unless coil springs are ordered.

**MATLACK'S CLEVER PUBLICITY WORK.**

Before the close of the New York cycle show the name of Featherstone was pretty well known to the thousands that thronged Madison Square Garden. In the center of the show, fronting on three aisles, was placed the booth of A. Featherstone & Co. The platform was covered with Smyrna rugs, on which were displayed the seven models of the firm. Desks, chairs and tables lent additional elegance to the arrangement. Extending crosswise of the exhibit, and surmounting the space, was an elaborate electric sign of 350 miniature incandescent lamps, comprising the well known script, "Featherstone bicycles." During the week two pretty girls in cycle costume distributed 10,000 carnation pinks to the visitors.

For the purpose of creating additional interest, J. C. Matlack, who has charge of the eastern trade, offered four Featherstone bicycles, to be allotted on the closing night. Coupon tickets were given to all who wanted them. One part was retained and the other, with name and address, deposited in boxes at the booth. Over 20,000 of these tickets were distributed. On Saturday night all the tickets were placed in a revolving holder and thoroughly shaken up. A little miss in a pink frock was selected to do the drawing. For fully thirty minutes the entire attention of the vast multitude present was concentrated in the direction of the Featherstone booth.

Not content with that, Manager Matlack equipped the programme boys with caps and coats bearing the name of the bicycle and then capped the whole thing by placing small signs reading: "Get a Featherstone pink," in every place in the Garden.

**THE WATSON AUTOMATIC SEAT POST.**

The accompanying illustration shows the latest pattern of the Watson seat post, which since its comparatively recent introduction

has become widely known and popular. By the removal of two screws the post may be readily changed from a front to a rear L seat post or vice versa. The binding of the Watson post, since it acts equally for its entire length, does not tend to bulge the tubing in the seat mast. It is so easy to loosen the post from the frame that a rider may take the saddle and post from his machine when leaving it in public places and thus prevent cycle thieves from riding it off. The ready adjustment also makes it convenient for la-

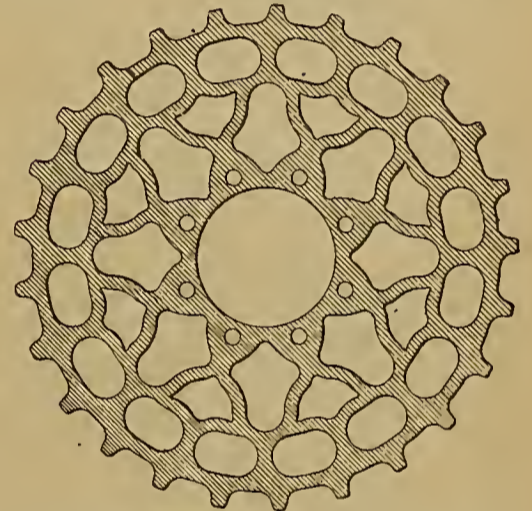

dies and others who, when on a long ride, desire to raise or lower the saddle for the purpose of resting the muscles by obtaining a new limb movement. The scale on the forward section permits the removal and replacement of the post without having to experiment in order to get the post in exactly the same position as before. Eight post diameters are furnished. The maker is the Watson Automatic Seat Post Co., 9 Warren street, New York city.

**A WELL MADE MACHINE.**

The cycle product of the J. L. Board Engraving Co., who are makers of high grade bicycles at 182-186 Clinton street, Chicago, has been on the market for the past three years in a small way, and has given such general satisfaction that the firm has now decided to manufacture on a large scale. A strictly first-class machine is being made by the firm. Unusual care is taken in the selection of materials, which are worked up by special mechanics. Already the firm has booked orders for 75 per cent. of this season's output, as calculated in advance, and may be obliged to increase its capacity. An advertisement descriptive of the characteristic features of the machine is to be found elsewhere in the Cycle Age.

**HADLEY SPROCKET DESIGN.**

G. W. Hadley of Chicopee Falls, Mass., has been granted a design patent on a front sprocket, and the patent is assigned to the Lamb Mfg. Co., which makes the Spalding bicycle. The cutting out of metal in the sprocket plate is shown in the accompanying illustration, from which it will be noticed that the distinctive feature is the leaving of a net work of metal whose parts are ap-

proximately equal in width and have all marginal lines joined together without angles.

**WANAMAKER DISPLAYS ORIENTS.**

In order to assist John Wanamaker, who has secured the agency for Orient bicycles, in making a proper display of these machines at the big store in Philadelphia, the Waltham Mfg. Co. loaned its New York exhibit. This exhibit comprised single machines, multicycles ranging from the tandem to the seven seater, and the Orient electric runabout. In addition to attractively decorating the store, Wanamaker advertised the function in most liberal fashion. The machines were displayed on the first floor of the establishment. It may be said in refutation of various comments on the methods of large stores in selling bicycles that Wanamaker is advertising his intention to maintain prices on the Orient.

**KEIM'S CYCLE FITTINGS.**

John R. Keim, successor to the Spaulding Machine Screw Company, has issued a catalogue descriptive of the cycle fittings which he is manufacturing in Buffalo, consisting of head clips, single piece heads, seat post brackets, frame tees, seat post clusters, handlebar tees, seat post tees, crank hanger brackets, handlebar clamps, brace tips, rear forks, crowns, head shells and fittings, hub and hanger shafts, flanged shells, frame and stay braces, crowns, cones, lamp brackets, reinforcements, coasters, sprocket wheels, wood rim washers, brake spoons, complete hubs, Kensington pedals, Spaulding and Genesee pedals, complete frames, handle bars and flat rolled steel. The catalogue is thoroughly descriptive of the goods which are manufactured, both in reading matter and illustrations.

**A CHANGE IN DISCOUNTS.**

The Chicago Tube Co., 217 E. Washington street, Chicago, has just issued a new discount sheet in which some attractive price combinations have been made on the mate-

rial, parts and fittings handled by the company. The new price sheet, besides affecting sets of stock and fittings, applies as well to built-up frames, either enameled or unenameled, and to frame sets. The built-up frames made by the Chicago Tube Co. are all late popular patterns and are offered both for 28 and 30-inch wheels, with three-crown or regular construction and with eccentric hanger or rear chain adjustment.

**STERLING SINGLES AND TANDEMS.**

The recently issued twelve-page folder of the Sterling Cycle Works of Kenosha, Wis., is distinctive because of two large groups of illustrations, one showing the single machine models and the other the various notable

Men's Roadster. Price, \$50.

Ladies' Roadster. Price, \$50.

Men's Chainless. Price, \$75.

Ladies' Chainless. Price, \$75.

Double Diamond Tandem. Price, \$75.

Convertible Tandem. Price, \$85.

features in Sterling construction and equipment. The Sterling line comprises the six patterns here illustrated.

The singles, while possessing many new points, still embody the short rear frame which has long been a characteristic of Sterling design. The catalogue mentions the fact that the frames are now brazed by the immersion process and states that it is because of the surety of this process that the company is enabled to use flush joints without being doubtful of the brazing in them. English Mannesman tubing is used in all patterns. The Sterling special direct spoke hub and the Sterling arch crown are retained as valuable features. The rim used is the Lobdell one-piece, striped to match the frame.

The regular finish is as heretofore, Sterling olive, striped and ornamented. Plain black is offered as an option. Either Velox or Record pedals will be sent with machines as desired, and in the way of saddles the purchaser may have the Garford, Plew, Wheeler or Hollenbeck rawhide, and for a slight additional charge, the Christy. The tire options include the Hartford, Palmer, Kangaroo, Dunlop or G. & J. The single machines have a new pattern oval crank, while the regular square crank is used on the tandems. Rigid steel handle bars or an adjustable bar of new design are offered on any of the patterns.

**CHANGE OF PARTNERSHIP.**

The American Cycle Fittings Co. of New York city, which has given much attention to the export trade and established strong connections in the principal foreign markets through the residence in London of one of its partners for the past year, is making further bids for business by a change in its arrangements which will be of benefit to the many business firms it represents.

Jos. Friedenstain has disposed of his interest in the company to W. W. Stall, in order to devote his entire time to European business, having formed a company in London under the name of South British Trading Co., Ltd., with a capital of \$50,000, of which he takes the managing directorship. Mr. Stall will continue as manager of the American Cycle Fittings Co. at New York. This arrangement will give the American Cycle Fittings Co. new connections abroad which will bring it in closer touch with foreign buyers and enable it to increase its business by being directly connected with the largest houses in European markets.

**PERPETUAL PEDAL PATENTED.**

The Perpetual separable pedal manufactured by Edmunds & Metzel, 115 Monroe street, Chicago, is now fully protected by a patent granted to G. F. Marchant. The draw-out feature of the pedal barrel which

makes it possible to remove the spindle and balls from the frame without disturbing the adjustment is the particular point claimed in the patent.

**HOLLENBECK STOCKHOLDERS PLEASD.**

At a recent meeting of the stockholders of the Hollenbeck Saddle Co. of Syracuse, Robert Croasdale was re-elected president, and George H. Lloyd, treasurer and general manager. The stockholders received the encouraging report that the factory is being operated day and night turning out the 12-ounce Rawhide saddle for which this company has a large number of orders booked.

**TRANSFER OF CHIEF CYCLE CO. PROPERTY.**

The League Cycle Works of Milwaukee, successors to the League Cycle Mfg. Co., purchased the balance of the stock, tools, fixtures and machinery of the Chief Cycle Mfg. Co. of that city last Saturday, and besides putting up about 500 Chief bicycles, is in a position to furnish repair parts to the owners of the Chief machines.

**MONARCH AND DEFIANCE BICYCLES.**

The catalogue of the Monarch Cycle Mfg. Co. of Chicago has been issued and describes fully the construction and methods used in the manufacture of the various patterns of Monarch and Defiance bicycles. The introductory claim made by the company brings out the point that its growing capacity and its established trade position permits it to turn out machines at lower manufacturing cost and to market them with less selling expense than would be possible in a younger and smaller factory. Accordingly the company is able to reduce the list prices of Monarchs without lowering the quality of the machines.

On all but the Cooper Special racer two-piece hangers of special construction are used. In this hanger a section of the shaft

**THE STAR SCREW CUTTING LATHE.**

The accompanying illustration shows the latest form of Star screw cutting lathe for either foot or engine power, made by the S-neca Falls Mfg. Co., of S-neca Falls, N. Y. The head stock has a hollow spindle, phosphor bronze bearings and improved end thrust ball bearings which greatly reduce friction in drilling. The tail stock is fitted with an adjustable side movement device useful in turning tapers. A plain gib rest is regularly fitted, though a compound rest of late construction is furnished as an extra attachment. The automatic friction cross and longitudinal feeds are actuated by a phosphor bronze worm on the lead screw which is splined, and for all work except screw cutting it acts simply as a feed rod, and therefore the only wear on its threads is in screw cutting. The feed may be thrown in or out of contact by simply turning a band knob in the apron, and will feed in or out, right or left, cut screws right or left, or may be thrown out of gear entirely by moving a lever in the head stock, without changing the motion of the foot or driving power. The cross-feed will be found valuable in a large variety of work, as it secures perfect accuracy in turning or facing up work, and with the addition of simple fixtures, which can be made by any ordinary workman, light milling may be done. The lead screw is provided with an open and shut nut, which is thrown in or out of contact by means of a cam lever in the apron. It will cut all standard threads, from 3 to 64, inclusive, without compounding the gears, and nearly all threads by compounding them. The foot power attachment affords a walking motion and can be started or stopped instantly and may be operated with both feet when sitting or one foot when standing. Countershaft is furnished if desired. The lathe is fully described in the company's catalogue "B".

## Graceful Staunch Reliable

What you get for your money is as important as the amount you pay.

### National Bicycles

have an unblemished reputation. They have always given dealer and rider satisfaction. They have always been sold at a stable price. They have always carried the greatest number of practical yet simple improvements. They have a market of their own. No National dealer ever suffered cross competition. Every National dealer gets the benefit of his efforts in increased sales and a growing number of satisfied customers.

Price is relative. Profits are predicted by good business men on something besides first cost. It's the NET profit you want. Our catalog is readable.

Bay City, Mich.

A NATIONAL RIDER NEVER CHANGES HIS MOUNT.

## Plain Talks on ANDRAE Cycles

VIII—Light Roadster for Men, \$50.

This is the most handsome bicycle built.

Its taking points have been turned into selling points.

There's more money in selling than there is in talking. We needn't argue that with agents.

The Andrae improved pattern frame, Andrae rigidity, quality, bearings sell the bicycle without talk.

The Andrae hub, with sprocket-like flange for direct spokes is another selling point.

This light roadster is to be shown to the "elite" of your city. There is no reason why a man should not buy an Andrae after he sees it.

There are 14 models in the Andrae line. Every one a seller on sight. Write for trade prices and our monthly paper, "The Andrae Agent."

**Julius Andrae & Sons Co.**  
MILWAUKEE, WIS.

## The Welcome to Waverley BICYCLES

This year is phenomenal. It is based on the good service Waverley Bicycles gave their riders all through 1898, and on the profitable business that resulted to Waverley agents. This year Waverleys are better than ever, with more talking points, and yet their price is but

≡≡≡ \$40

In addition we provide for our agents a lower-priced line, so that they can meet the demands of everybody.

Ivanhoe Specials, - - - \$35  
Ivanhoe Bicycles, - \$25 and \$26

Waverleys and Ivanhoes are the best values ever offered to the public, and will make the Waverley agency more desirable than ever. Write.

**INDIANA BICYCLE CO.**  
INDIANAPOLIS, IND.

We are almost ready to talk about our perfected Electric Motor Vehicles. Our announcements of the next few weeks will be interesting.

is forged together with each crank and these are locked together with a sleeve having threads of different pitch but both right-hand, so that when the sleeve, which also serves as a hub for the sprocket and spider,

Hartford and Morgan & Wright tires are the regular options in those fittings. The racer will be fitted with Palmer tires if desired.

To meet the popular demand for one-piece

Monarch Chainless. Price, \$75.

Model 63, Defiance—Weight, 25 lbs. Price, \$35.

Model 70—D. D. Tandem. Weight, 45 lbs. Price, \$75.

Model 68, Monarch—Weight, 25 lbs. Price, \$50.

Model 67, Monarch—Weight, 25 lbs. Price, \$50.

Model 64, Defiance—Weight, 25 lbs. Price, \$35.

is revolved on both shaft sections at the same time it draws them together.

A change toward neater appearance that has been made in Monarch patterns is in the form of the seat cluster lug, which is now clean cut and devoid of bulkiness. The standard finish is plain black, highly polished. Garford and Hunt saddles, and Dunlop,

hangers the Cooper Special is fitted with such a hanger of the company's own construction. There is no threading in the barrel ends, the cups fitting into tapered seats, as may be seen in the illustration

herewith, which shows the construction of the hanger. Besides the regular line shown here in full, the company also makes a pair of up-to-date machines to be sold at popular prices. They are styled the King and Queen.

**WILL SUPPLY BULLIS GEARS.**

The Bullis ball gear will be handled in the west and south by the Excelsior Supply Co. of Chicago. Considerable improvement has been made in this gear since it was first noticed in this paper. Drawings descriptive of the changes will soon be supplied readers.

**WANTS GOODS FOR EXPORT TRADE.**

The Violet Cycle Co. of Westfield, N. J., has just completed its new salesroom and now wants quotations on goods for export. Its store is located in the suburban district of New York, easy of access to buyers, who are personally conducted to the store by representatives of the firm.

**FROST GEAR CASE IN NEW HANDS.**

The American Mfg. Co. of Indianapolis has purchased the entire business and patents of the Frost Gear Case Co., and is now in position to supply the trade with the well known Frost gear covering.

**TRADE NOTES.**

The Miami Cycle & Mfg. Co. of Middletown, O., has begun the manufacture of its well known Racycle two-piece crank hanger at Toronto, Can., under the management of W. E. Houghton.

C. K. Anderson, 164 La Salle street, Chicago, Ill., will in the future take care of the western sales of the Hollenbeck Rawhide saddle made by the Hollenbeck Saddle Co. of Syracuse, N. Y.

# Merit Wins Its Own Reward

Never in the history of Saddle manufacture has the record won by the famous **Hollenbeck Rawhide Saddle** been equaled, and never in the history of this popular saddle has the demand for it been so great.

Thirty high-class bicycle makers are fitting it to their best wheels, while over 75 wide-awake jobbers are distributing the **12-Ounce Rawhide Trade Winner** at factory prices. There must be a reason for this condition, and there are several. No saddle made combines the Lightness, Beauty, Comfort and Durability to such a great extent. Investigate

# THE PASTIME AND SPORT

## GATHERING IN PROVIDENCE

League Delegates Assembling to Elect Officers and Settle the Question of Racing Control.

League officials and state delegates have been gathering in Providence, R. I., during the first part of this week to take part in the annual assembly which convenes there today, February 8. President Potter and a number of other prominent New York state members arrived Tuesday, and delegates from other eastern divisions arrived that night, while later ones were expected Wednesday morning. Illinois delegates left Chicago Saturday night. The two Canadian delegates from the C. W. A. and belated members from western states were looked for Wednesday afternoon.

The first day will be devoted entirely to good roads matters and reports on road subjects, and there will be a dinner at night, given by the Rhode Island Improvement Association, at which many people prominent in cycling and good-road work will speak. It is believed that the complex racing situation may be cleared somewhat by Thursday night. The tilt between the faction favoring the divorcing of racing from the League and those who think the League should continue to retain control of the sport promises to bring out something interesting.

Election of officers will occur on Friday and will occupy but little time, there being little opposition to the various candidates.

## Pennsylvania Racing Circuit Formed.

Philadelphia, Feb. 6.—Local racing men are greatly interested in the announcement of the formation of a six-cornered circuit by prominent clubs in the following cities: Williamsport, Bloomsburg, Wilkesbarre, Reading, and Allentown, in Pennsylvania, and Binghamton, in New York. Three-year contracts have been signed with track owners in each town, and as at present arranged at least four circuit meets will be run off at each track. All these towns are within six hours' ride of Philadelphia, and many of the Quaker City flyers have announced their intention of taking in the circuit.

## Banker Wins the Prize of Tunis.

The principal event of the race meet run at Tunis, Algiers, January 22, on the winter circuit, was the great prize of Tunis race at 3,000 meters. It was won by George Banker in 4:45 by several lengths from Tommaselli, with Grogna third. The track was small and gave the American a slight advantage. For the first time since handicap races were inaugurated on the circuit Banker was badly defeated, running third in his heat, with Chavanne, 70 meters, first, and Coquelle, 40 meters, second. Grogna won the final heat from 15 meters in 1:22 1-5, defeating Coquelle, who ran second. Banker and Tommaselli won the tandem race as usual, with Coquelle and Grogna second.

## Pushing Intercity Path Scheme.

Washington, Feb. 6.—The Maryland Cycle Path Association has been formed, with the object of promoting the construction of a cycle path between Baltimore and Washington, and it is understood to have good backing in Baltimore. During the week Conway W. Sams, chief consul of the Maryland Division of the L. A. W.; Park Commissioner Casey, R.

A. Pfeffenhofer, and A. H. Harvey, representing the new association, were in Washington conferring with local League officials to secure the co-operation of the Washington wheelmen. It is proposed to capitalize the association at \$5,000, consisting of 5,000 \$1 shares. The executive committee of the association is vested with power to increase the capital stock. It is proposed to fix the initiation fee at \$1, which shall be in lieu of the first year's dues. After that there will be an annual fee of the same amount. Every member is to be provided with an emblem, which, when placed upon his bicycle, shall entitle him to the use of all paths built by the association during the calendar year for which his dues are paid.

## Road Training on the Coast.

San Francisco, Feb. 6.—The middle and long distance riders who are now here training for the coming races to be held on the coast by the American Cycle Racing Association are doing some fast work on a three and a half-mile stretch of boulevard which skirts the ocean out at the Golden Gate. Most of the pacing is done by Henry Fournier on his motor pacing machine, and miles much under two minutes have been cut out day after day. Waller hangs onto the rear wheel of the motorcycle with a tenacity that makes the other riders jealous. Fredericks, the Swiss rider, has been training hard lately, and Miller says that he is to be most feared of any of the long distance riders. Waller is also afraid of the Swiss. Miller has been demonstrating his ability to ride unpaced by doing some flying half-mile sprints, in one of which he covered the distance in 1:00 1-5. The Kennedy-Michael aggregation have established bachelor quarters and engaged a Chinaman as housekeeper.

## Southern Cyclists' Second Meet.

New Orleans, Feb. 6.—The Southern Cyclists' Association held its second Sunday race meet here January 29. The eastern professionals were in good humor, and though they knew that their winnings would not net them a week's board, each strove hard to win the various events. An informal meeting of the members of the association was held at the track and it was decided to hold another Sunday race meet February 12, the Sunday immediately preceding Mardi Gras. The summaries of the principal events follow:

Half-mile open—D. Kramer, first; Miller, second; G. Kramer, third. Time, 1:17.  
One-mile handicap—Repine, 15 yards, first; Verilhac, 30 yards, second; G. Kramer, 25 yards, third. Time, 2:34.

## No Memorial Day Race in Denver.

The last decoration day road race in Denver under the auspices of the Associated Cycling Clubs of that city has been run, the association having voted at a meeting held last week to abandon the race on that day in deference to the requests of the G. A. R. Hereafter the day will be left to the old soldiers and another selected for the annual road race.

Cities and towns in Massachusetts are empowered to lay out and maintain cycle paths, and in Ohio the county commissioners have been authorized to levy a license tax of \$1 a year on bicycles and with the proceeds to construct and keep in good shape such paths as may be deemed desirable. The legislature of New York is now considering a similar proposition.

## OPPOSING STONEMAN'S BILL

New York Cyclists Preparing to Defeat Proposed Law Allowing Towns to Regulate Cycling.

Representative Stoneman, from Cattaraugus county, N. Y., is meeting with vigorous opposition since he began in the state legislature to foster his proposed enactment for the amendment of the town law in relation to regulating the use of bicycles. Wheelmen responded heartily to the appeal of the New York state division of the L. A. W. in its recent circular calling on cyclists throughout the state to oppose the bill in every way possible, and if the power of the wheelmen of New York amounts to much politically, the bill is apt to meet an early and violent death. At least so the wheelmen hope.

Instead of proposing a law that would be universal in its scope, Mr. Stoneman deems it desirable to enact a law which would lead to confusion and constant difficulty because of conflicting ordinances in different towns by providing that the town board of any town may adopt ordinances regulating the speed of bicycles on any highway in the township outside of a city or village; requiring or prohibiting the use of bells or lamps on those highways; prohibiting riding on side or foot paths, and may prescribe fines for violation of the above not exceeding \$5 for each offense. One-half of each fine, according to the proposed law, is to be given to the person giving evidence of the violation.

The bill, if it passes the legislature and becomes a law, will directly injure every wheelman in the state who rides out of his own township, and for tourists it will cause untold annoyance. One township might have a speed limit of five miles, the next a limit of eight miles, and a third of ten miles, and the tourist, unless he were familiar with the various ordinances and knew exactly where one township ended and the next began, would doubtless in the course of a good day's riding unconsciously and innocently violate several ordinances and make himself liable to several fines. In one town there might be an ordinance requiring the carrying of bells and in the next an ordinance prohibiting them.

It is hard to conceive what good to anyone the originator of the bill believes can come out of it.

## Unpopular Measure Defeated.

When the bill to prevent the trundling of bicycles along the sidewalks of Philadelphia, which was introduced into common councils by Frank M. Riter, director of public safety at an annual pittance of \$10,000, came up for discussion last Thursday, the city solons poked all manner of fun at the bill, one of them even going so far as to offer a jocular amendment forbidding the riding of bicycles within the city limits. Afterward, when the time came to vote on the measure, not a single ballot in its favor could be mustered. The A. C. C., backed by the wheelmen of the city generally, was responsible for its downfall, and Director Riter is breathing dire vengeance.

## Boston Gets the Meet.

It has been officially announced by Secretary Abbot Bassett of the L. A. W. that the result of the mail vote of the delegates on the question of the location of the '99 meet gives Boston the choice.

## WHEELER SADDLES

HAVE ALWAYS BEEN MADE WITH THAT  
CURVE IN THE BACK.

OUR LINE FOR '99 COMPRISES BUT FOUR DISTINCT MODELS:

- "EXTRA" Woman's . . . . Broad, Soft and Easy. ❀❀
- "EXTRA" Men's . . . . Hygienic and Durable. ❀❀
- "SPECIAL" Roadster . . . . An ornament to any wheel.
- "CORK-TOP" Racer . . . . Light and Graceful. ❀❀❀

These saddles are made and finished in the careful and stylish manner that has always characterized Wheeler Saddles.

**NEWS IN BRIEF.**

Denver cyclists are planning to petition the Colorado legislature to set aside each year a day to be known as "Wheelmen's day," and to declare it a legal holiday.

Press reports state that Jimmy Michael and his traveling fellows were recently instrumental in removing two dying trainmen from the debris of a wreck near San Antonio, Cal.

The eastern racing men who sought fortune in New Orleans are sadly trying to gather together \$15 firsts and \$3 thirds to purchase transportation to some other part of the country.

The racing men who are planning a trip to the Argentine Republic will, if successful, follow "Plugg Bill" Martin to South Africa, where bicycle racing is in a most flourishing condition.

The amateur racing men of France, being dissatisfied with the existing rules governing their branch of the sport, are on the verge of organizing and formulating new rules. They will not attempt to form a new league, but will ask the Cyclists' Syndicate of Northern France to take charge of their interests.

The eight-lap track which Jack Prince has been building in Houston, Tex., has been completed and racing was begun on it Sunday, February 5, local riders competing. The races are scheduled to last until late in April, and it is probable that some of the men now racing in New Orleans will go to Houston in search of better prizes.

"Hub clubs" are already in existence and in process of formation among the wheelmen of Philadelphia who intend visiting Boston at the time of the League meet. A specified amount is paid into a common fund each week, and by August next the moneys so paid will have amounted to a sum sufficient to pay the expenses of the entire club for the trip.

Philadelphia wheelmen are preparing to dabble in politics a little at the coming local election. Thomas Hare, president of the Associated Cycling Clubs, has been nominated for common council in the Thirty-second ward on an independent ticket, and every bicycle rider in the ward is being urged to

break party ties regardless of previous affiliations and vote for him. His chances are considered good.

Charles G. Kilpatrick, the one-legged trick rider and globe trotter, has recently returned from a trip to Cuba, where, according to his own statement, he rode down the famous slope at San Juan.

The development of bicycle racing among college men has led to the suggestion that that form of sport be conducted separately from other college sports, and doubtless after the regular annual meeting of the Intercollegiate association, to be held the latter part of this month, a distinct organization will be formed. The Intercollegiate Bicycle Association, if it materializes, may work in conjunction with the L. A. W., and if so, will prove a strong ally.

**MISCELLANEOUS.**

Advertisements under this head 5 cents per word first insertion, 3 cents per word each insertion thereafter. Cash with order. Express orders, postoffice orders, or stamps received.

**WANTED**

WANTED—A man having full knowledge of the manufacture of double-tube bicycle tires and inner-tubes. Address G. H. R., Postoffice Box 1553, New York, N. Y.

WANTED—Position with bicycle factory; foreman or contract; 15 years' experience; understand every part of wheel, also horseless carriages. BEINFELD, 209 W. 115th St., New York.

MANUFACTURERS—Gentleman, trained engineer with central London office, many years' experience in the cycle trade, large connection amongst manufacturers, factors, shippers and agents, is open to take up and thoroughly work through travellers and himself a good sole agency for cycles, components or stampings, etc.; best firms only entertained. R. M. P., care Cycle Age.

WANTED—Bicycle dealers and repairmen to send us 25c in stamps or otherwise and we will send them a receipt for making the best and cheapest puncture proof fluid in the country; easily made. Very effective; prolongs life of rubber. FT. WAYNE NOVELTY Co., Ft. Wayne, Ind.

## CANADIANS WILL NOT COMBINE

### Rumor That Big Concerns Were About to Pool and Save Home Market from Invasion.

A week ago it was whispered in some of the large manufacturing centers that a plan was afoot to bring about the consolidation of half a dozen large cycle making concerns in Canada, save in the neighborhood of \$200,000 annually in the marketing of their joint product, arrest or completely choke off the competition which American makers give Canadian manufacturers in the Dominion, and, in short, bring about a state of affairs among Canadian makers which will lead to the return of more prosperous conditions than have been reigning for the past twelve months.

#### The Story Emanated from Chicago.

Upon presenting this information, as it was disclosed through a former Canadian now resident in Chicago, to the leading cycle manufacturing concerns in the Dominion, it was ascertained that it had no foundation. No such project has ever been broached to Canadian makers, and, while they have naturally desired to stem the flood of machines exported from this country to theirs, yet they do not see any hope of accomplishing such a result by pooling. That part of the rumor which credits the Canadian makers with a desire to reduce expenses in the marketing of their products is one which has been under discussion in every quarter of the United States and Canada since the cycle industry began.

#### Details of the Alleged Consolidation.

As the story goes, it was the intention to form a monster consolidation among the Canadian cycle makers, the preferred stock or debentures to be issued according to the valuation of the various plants which desired to form part of the combination. Common stock was to be issued for good will. It was hinted that such a consolidation could be brought about within a period of four months.

#### Canadian Makers Enter Denials.

The Planet Cycle Works, of Toronto, was much surprised upon being informed by the Cycle Age that gossip of the nature above set forth was current. The firm emphatically declared that there was not the least chance of the scheme ever being given vital form.

The McBurne & Beattie Company, of Toronto, replied stating that there was no foundation for the rumor, that no such scheme was ever broached to the Canadian Manufacturers' Association, of which the firm is a member, that the scheme was impracticable and visionary.

The Canadian Typograph Co. and other firms responded in similar vein.

#### Opening of Pittsburg Show.

The cycle show now being held in the old city hall at Pittsburg by the local

cycle board of trade opened last Saturday evening and was well attended and alive with local interest. More than thirty makes of bicycles were exhibited by the respective local dealers handling them, and in addition was an exhibition of horseless carriages and motor tricycles which attracted a large part of the spectators' interest. A feature of the show that is proving a drawing card among the cycling fraternity is the contest for a \$100 prize for the most popular bicycle club in western Pennsylvania. The cycle board of trade is not attempting to make money out of the show, being satisfied to come out of the affair even with expenses.

## M. & M. W. CO. BURNED OUT

### Million Dollar Fire Causes Total Loss to Supply Company—Other Cycle Stock Ruined.

The Manufacturers & Merchants' Warehouse company of Chicago has been completely burned out at a loss of between \$100,000 to \$150,000 by a terrific fire that totally destroyed the seven-story brick warehouse at 10 to 24 West Water street Tuesday night.

Among the fifty or more other firms which sustained losses amounting to from \$2,000 to \$100,000 were Kelley, Maus & Co., bicycles and supplies, \$80,000; H. E. Graves, bicycles, \$10,000, and J. B. Barnett & Co., bicycle supplies, \$5,000. The M. & M. W. Co. carried \$65,000 insurance. Kelley, Maus & Co., \$100,000, and H. E. Graves, \$10,000.

The building was known as the Traders' warehouse and was built seven years ago. It was of improved mill construction and was claimed to be the finest warehouse in the west, but within a few hours after the starting of the fire at 9:15 in the morning the walls had fallen and it was a smoldering heap of ruins.

Frozen fire plugs hindered the firemen so that it was eight minutes before the first stream of water was playing on the fire, and before it was gotten under control thirty-five engines and two fire tugs were at work.

The fire started in a pile of hemp lying in contact with a steam pipe.

## SADDLE PRICES NOT TO RISE

### Outline of Policy to Be Pursued By the American Saddle Company—Working Capital Subscribed.

On February 8 in Cleveland, Ohio, the stockholders of the American Saddle Company, with a capital stock of \$1,800,000, elected directors, and the latter elected the following officers:

A. L. Garford, president and general manager.

S. S. Kurtz, vice-president.

Heman Ely, secretary and treasurer pro tem.

The following board of directors was elected: A. L. Garford, J. A. Hunt, S. S. Kurtz, D. F. Prince, L. H. Foster, M. B. Johnson and B. F. Yates.

Mr. Garford is at the head of the Garford company; Mr. Hunt is the active force in the Hunt company; Mr. Kurtz is the ruling spirit in the Gilliam company; Mr. Prince directs the fortunes of the P. & F. company; Mr. Foster controls the affairs of the Wheeler company; Mr. Johnson is a lawyer representing the Brown company, and Mr. Yates is the representative of the Canadian factory of the Wheeler company located at Toronto.

#### The Men Who Will Exercise Control.

The American Saddle Company will be controlled by an executive committee consisting of Messrs. Garford, Foster, Kurtz and Prince.

Of the capital stock \$800,000 is preferred and the remainder common. The Garford, Hunt, Gilliam, P. & F., Wheeler and Brown companies will continue to manufacture the patterns with which the name of each establishment has been peculiarly identified, but under the direction of general managers who will be subject to the executive committee of the new organization. The American Saddle Company takes control of all the plants from January 1 of the present year, each establishment having agreed to turn over its business to the new company free of incumbrance.

#### New Working Capital Subscribed.

In the valuations put upon the various plants all quick assets were thrown in, and only the actual value of each plant paid for with stock. Then a new working capital of \$200,000 was subscribed in a single day. No prospectus was issued, a fact which by itself sufficiently indicates the confidence of investors in the new company.

It is not improbable that all goods shipped from the various factories will be invoiced direct from the mills instead of from the general offices of the new company, which are located in the American Trust building fronting the square in Cleveland. This, however, is a matter which has not yet been fully decided.

For the remainder of the selling season no noteworthy changes will be made either in the methods of selling or man-

ner of manufacture. What may happen next year, however, is a matter of such considerable interest that it is well to let the head of the American Saddle Company talk to the point.

"It is not the purpose of the American Saddle Company to increase the price of saddles," says Mr. Garford. "Such never has been the purpose. It is a well known fact that the saddle business had got to that point where many models were sold for less money than they cost to manufacture. This consolidation of saddle making interests will endeavor to reduce the cost of manufacture, and by the elimination of the expense of conducting and separately managing many concerns it is hoped, with present prices, there will be a fair profit in future operations. It is in the saving of cost of marketing our products, as well as in their manufacture, that we hope to make our profit, and not by the raising of prices.

#### Will Lessen Saddle Patterns.

"It is our purpose to reduce the number of saddle patterns. At the present time each concern in the American Saddle Company is putting out from ten to twenty different styles. This has had a tendency to confuse bicycle makers, and through the competition among the bicycle makers the public has got the impression that there is no end to the saddle options which they may demand. As a result saddle manufacturers have been compelled to make more patterns than were actually necessary, and in turn have loaded the bicycle makers with patterns which, if not wisely bought, have proved very burdensome. We hope to eliminate a large number of models that heretofore have had but limited sale and leave only standard types. That such a plan is not impossible of accomplishment is demonstrated by what has taken place in tire manufacture and in other branches of the industry which are not cumbered with unnecessary patterns. We will therefore select from among the concerns now in the American Saddle Company the models which are most popular with riders and endeavor to find demand exclusively for those patterns."

#### All the Year Round Manufacture.

Every effort of the American Saddle Company will be bent toward that indispensable condition for really economic production, namely, all the year round manufacture. The undoubted advantages which the concern will have in the matter of purchasing stock will enable it to buy cheaply and to make metal parts, such as clips, screws, bases, plates, etc., much cheaper than those articles are now being produced.

The commercial value of a high purchasing capacity is best understood when it is stated that annually there is the sum of \$750,000 to be spent by the concerns now consolidated. If it is found that certain work common to all of the concerns in the big company can be manufactured cheaper in one establishment than in another, the one which can produce most cheaply will be instructed to take care of the work. The value of this method of distributing work will be apparent even to those who may not coincide with all the views entertained by the American Saddle Company, for it is well known that the cost of labor in the production of the cheaper forms of saddles is much less in certain parts of the country, where conditions are favorable for manufacturing, than in others, where wages are high and consequently cheap production is out of the question.

#### No Radical Change Till July.

It is not the intention to make any very striking changes in the prevailing methods of merchandising saddles before July or August. By the arrival of that time, however, the true work of the American Saddle company will be start-

ed, and as fast as goods are turned out of the various factories they will be warehoused and hence will be ready for instant delivery in large quantities at any time manufacturers, jobbers, agents or riders may want them. The fact that the executive body of the American Saddle Company considers that half a dozen standard types of saddles are sufficient to be reckoned as standard, and the further fact that it is the intention to confine manufacture almost exclusively to such standard patterns, will operate to prevent the product from getting out of date unless some unlooked for change in the taste of the general public should take place.

#### Will Energetically Seek Foreign Trade.

It is highly probable that the big company will establish depots in many of the principal cities in foreign countries. Already each of the establishments in the new company has built up an extensive foreign trade and several of the mills will send almost 200,000 saddles abroad this year. Just how the product intended for foreign countries will be marketed is as yet undetermined, although it is not unlikely that Markt & Company, who have signalized their usefulness to several of the concerns in the American Saddle company, will act as general foreign distributing agents for the combined interests.

#### Plans for the Future.

Something more than the mere continuation of the present methods of manufacture is intended by the new company, for negotiations are already afoot for the purchase of the latest and best machinery for construction of all kinds.

The company lays special stress upon the fact that it owns most of the valuable patents on saddle construction, and announces its intention to take aggressive steps for the protection of its property.

#### OPENING DAYS FAVORED

Dealers of Detroit and Columbus Will Make Simultaneous Individual Displays.

The Detroit cycle board of trade has decided to have a general spring opening of the bicycle stores of that city on March 1, 2, 3 and 4. Stores will be open day and night and will be attractively decorated and illuminated. There are fourteen members in the board.

Arrangements for a bicycle show in Springfield, Mass., were completed by John Adams, manager for the local agency of the Cleveland firm, last week, and the exhibition was to open this week Tuesday. Twenty booths were provided and neatly trimmed. Most of the spaces were rented by local firms.

Special efforts to interest women in cycling are to be made at the spring cycle show, to be held March 24 to April 1, in Grand Central Palace, New York City, under the management of Allen S. Williams. The display will include exhibits of drop frame and women's diamond frame bicycles, accessories for the convenience and comfort of women riders, and ladies' costumes, shoes, etc. Prizes are to be presented for the most ingenious and meritorious cycle or sundry device invented by a woman and for the largest number of century bars and racing medals won by female riders.

The Associated Cycle Dealers of Baltimore met recently and decided not to hold a show in the spring under its own auspices, nor to take part in any show no matter by whom conducted. The reason given for this action was that their busy season is expected to begin about March 1 and it would be unwise to take their time from their stores. It was the consensus of opinion among those present that more bicycles will be sold this

year than last and that during the spring and early summer months at least there will be all the business the dealers can transact.

The Columbus, O., cycle board of trade met last week and decided to have a grand opening of their stores on March 1, 2, 3 and 4, each firm to have an individual display.

The New Haven, Conn., Y. M. C. A. will hold an exhibition of bicycles the last three days of this week for the benefit of the twenty cycle dealers in that city.

New Bedford, Mass., is to have a local show opening next Saturday evening and continuing until February 25, under the management of Theodore Bayliss.

Retail dealers of Grand Rapids assert that nothing is further from their thoughts than the holding of a bicycle exhibition this spring, as proposed by W. Montague Perrett, as they expect to be so busy next month that they cannot take their goods, clerks and their own time from their stores to attend a show. Even during the winter they have made sales enough to make it worth while to be in constant attendance at their respective stores. It is said that the show held three years ago proved a detriment to the business of all who participated.

A movement is on foot in Erie, Pa., to interest the bicycle dealers in a local bicycle show and carnival to be held at the opening of the riding season in March.

#### CHANGES AMONG DEALERS

New Jobbing Firm Formed in Newark—Westfield, Mass., Dealer Declares Bankruptcy.

John Cockburn, who carried on a strictly jobbing business last year at 504 Broad street, Newark, N. J., has entered into partnership with Lindley Underhill, Jr., late manager of the Liberty Cycle Co. of 567 Broad street, same place, for the past five years. The new firm will job bicycles, fittings, supplies and sundries on an extensive scale, buying and selling for cash only, at the latter address.

W. D. Wilmot, formerly selling and repairing bicycles in the Casino building in Fall River, Mass., has removed to 101 North Main street, in the same city.

Alanson A. Sanborn, a Westfield, Mass., bicycle dealer who has been in business with Fred E. Gridley under the style of A. A. Sanborn & Co., has filed a petition in bankruptcy in Boston. Total liabilities are placed at \$810, against assets of \$285.

H. M. Snyder & Co., cycle dealers in Detroit, have been burned out at a loss of \$2,000 by a fire that occurred February 4.

Marion Black has retired from the bicycle business of Meyer & Black at Fort Wayne, Ind., and the concern will in the future be known as the Meyer Cycle Co.

#### Boston Dealers Organize.

The organization of the Boston Cycle Dealers' Protective Association was completed last week, and J. F. Scott elected for president and Albert King for secretary, each to serve one year. Steps were taken to establish a bureau of credits and collections, which will begin operations at once and take care of this year's business. An executive committee, consisting of D. S. Pratt, W. S. Atwell and J. A. Cushing, was chosen to serve three months. All dealers in cycle sundries and parts have been invited to join the association.

The Kirk Mfg. Co. of Toledo has installed an acetylene gas generator in its home retail store and will hereafter lighten the premises by this means only.

**BEGINS TARDY RETRENCHMENT****BASES HOPE ON AUCTION SALES****Australia's Largest Agency Struggling to Recover from Extravagance - The Tire Trade.**

Sydney, Jan. 16.—The largest cycle agency in Australia, having branches in every colony, now finds itself compelled to resort to auction sales and to retrench expenses in various ways in order to keep alive after two years of extravagance. This is the Austral Cycle Agency, which made a huge effort to monopolize the entire trade throughout Australia, but failed signally in the attempt. The large losses sustained during the past two years are a matter of common gossip among the cycle dealers of the island continent, who have frequently been heard to say in the past twelvemonth, "I'll give them another three months to keep alive," yet the firm is still extant.

**Large Salaries and Racing Expenses.**

However, the agency has begun a policy of retrenchment, beginning with the advertising, and has disbanded its pacing teams, and it is believed that the racing men under contract will soon be given notice to quit. At the present time all the best racing men of Australia are employed by the firm and their wages and percentage of winnings must amount to very nearly \$500 per week.

Other examples of the heavy expenditures that have led up to the present lamentable state of affairs are the drawing of a salary of \$7,500 by the director of the firm and of the payment of salaries of \$2,500 to each of the managers of the head depots in the several colonies.

**Auctioning Off English Machines.**

Great endeavors have been made by this agency to push ungainly and inferior bicycles of English manufacture on which a number of racing men have sustained serious accidents on track and road. These machines sell in England for \$65, while the Austral Cycle Agency sells them here for \$140 and lists them in western Australia at \$150. Just before Christmas an auction sale of 100 new and second-hand machines of several makes was held in Adelaide, at which it is claimed an average price of \$55 was realized. If this is so, it was the best auction sale that has occurred in Australia. On Christmas eve another auction was held in Melbourne, at which eighty-five machines were put up and the majority were disposed of. They were all made in England. The highest price realized was \$80 for a road racing machine, while some of the bicycles went as low as \$32. Two women's bicycles brought \$69 each.

Today another auction is being held here in Sydney to dispose of 100 bicycles of the same make as those sold in Adelaide and Melbourne. It is hardly possible that this sale will be as successful as the previous sales, for the cycle business is none too brisk in Sydney and this auction will make it still worse.

**Instalment Sales Make Second Hand Stock.**

The Gould Bicycle company and the Sydney Cycle company are suffering the usual consequences of too liberal instalment sales and now find themselves burdened with enormous stocks of second-hand machines recovered from riders who, having purchased them on a first cash payment of \$10 and monthly payments of \$5, rode them three months and refused to make further payments. The well known firm of Scott & Morton wrecked itself on this same innocent looking coast of easy payments a few years ago.

Judging from the enormous profits realized from the sale of double tube tires

in this country at \$15.75 per pair, there should be an excellent opportunity for some American firm to reap a harvest by introducing double tube tires to sell for about \$12 a pair. They would have to be good tires, however, properly handled, and capable of standing rough usage as the Australian roads, which are very rough, combined with the excessive heat, soon ruins and finds the weak spots in an inferior tire. Eighty per cent. of the Australian riders use the double tube tires.

F. Grimley, dealing extensively in bicycles in Sydney, is stocked almost to the roof with American machines of 1897 and 1898 production. One of these makes which he is pushing is being sold at the ridiculously low price of \$40. When he clears his stock he may quit selling bicycles and confine his attention to the sale of sundries, of which he sells a large quantity.

**Adopting Wider Handle Bars.**

There is a growing tendency in both Sydney and Melbourne to abandon the very narrow dropped handle bars in favor of others a little wider.

A firm of Canadian manufacturers claims to have sold 1,800 bicycles in Victoria last season. If this is correct it sold as many machines as any other firm in that colony.

All the Beeston Humber bicycles of 1898 production which were imported into Australia were fitted with a double chain stay, which was said at the time to be a permanent feature. This year, however, all the new machines of this make being landed here have only the usual single stay. Riders found the double stay satisfactory when chain wheels of large diameter were used, as greater power was given to resist the high strains of big gears, but when low gears were fitted the least slackening of the chain caused a continued tapping on the upper stay which gave great annoyance to the riders. This feature has therefore been discarded, so far at least as the Australian trade is concerned.

**SUES THE BONDSMAN****A Columbus Rider is Unable to Satisfy Judgment Against Bicycle Protective Company.**

Suit has been brought by Lyman D. Wood of Columbus, O., against the Columbus bondsman of the Toledo Bicycle Protective Association of Toledo against which judgment was rendered some time ago in favor of the plaintiff for \$52 and costs for failure to make good the loss of a bicycle stolen from him.

The company failed to settle the judgment and did not appeal the case, leaving it to the successful plaintiff to recover the amount as best he could. There were no available assets of any kind, and in case there were no local bondsman the only recourse of the judgment holder would be to sue on the basis of stock liability, which would be very costly and which few would undertake.

Execution was ordered February 1 and placed in the hands of the sheriff at Toledo, who found that there was nothing available at the offices of the association that would justify seizure.

The company is composed of two lawyers and a manager. Efforts to learn who the other stockholders are, if there are any, have been unsuccessful.

A new process for the manufacture of calcium carbide which will so cheapen its cost that it can be sold at retail for 3 cents per pound has been invented by I. S. Prenner. The process has been successfully demonstrated at the Armour Institute, Chicago, and a plant is to be erected at Maquoketa, Iowa.

**COLUMBUS AGENTS SATISFIED****NO CALL FOR THIRTY INCHERS****Heavy Sales of High Priced Machines—Good Work Done By Local Board of Trade.**

Columbus, O., Feb. 13.—The promised demand for machines with 30 inch wheels has not materialized. Towards the close of last year every dealer was led to expect, from all the noise which appeared in the papers concerning these models, that the higher priced goods with 28 inch wheels would be completely superseded. Such, however, is not the case. A constantly increasing demand is noticed for chainless models, this increase being reckoned by what was discoverable last year. It is, however, yet too early to make accurate predictions touching the sale of chainless models.

**Good Business Anticipated.**

From March 1 to 4 the members of the board will formally open the retail season, each dealer in his own store. Indications point to a very good business for the coming season. Many more machines have already been sold thus early in the season than is usual in local trade, and, strange to relate, the early customers are not seeking cheap bicycles, but want the better grades.

**Effective Organization Work.**

The local cycle board of trade, which now includes all the leading dealers in the city, has been very successful in the past year. Two branch houses do not affiliate with the board, but are, however, in hearty sympathy with its general aims. So much money was lost in 1897 by giving away lamps, bells and other sundries in order to encourage purchasers of bicycles that the board last year stringently bound its members to abolish this practice and was very successful in the effort, in the case of one firm having been instrumental in saving almost \$800 as a result of abstinence from the practice. This agreement will continue this season.

**What is Left Undone.**

A schedule of prices on sundries and repairs will be adopted. Last year many sundries were sold at cost, even less. No effort will be made to regulate the prices of new machines, or the trading prices for second-hand machines, of the terms on which machines may be sold. It has been found in practice that the members of the board do not view these subjects in the same light.

**Receiver for Invictus Fittings Co.**

The Invictus Cycle Fittings company of Chicago went into the hands of the Chicago Title & Trust company as receiver last Wednesday, upon application filed by the Port Chester Bolt & Nut company of New York, the Crosby & Mayer company of Buffalo, N. Y.; the Hawthorne Manufacturing company of Maine, Morris & Bailey of Pittsburg, and Frederick Voss of Chicago, who claim to hold an indebtedness against the Invictus company aggregating \$2,600.

**Ewald Mfg. Co. Incorporated.**

The Ewald Manufacturing company of Chicago has been incorporated with capital stock of \$15,000 to manufacture bicycles and fittings. The incorporators are G. H. Somers, William E. Ewald and J. Charles Barker. The company has for some time been making hangers and other parts.

A bill has been introduced in the Wisconsin legislature which, if passed, will take bicycles out of the class of vehicles, and by so doing cut off their right of way on the road.

# MILWAUKEE TIRES

**PUNCTURE PROOF**

Pneumatic

Resilient

Single Tube

Easy Riding

COPYRIGHT 1898, BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.

**PRESENTING TESTIMONIALS.**

CRANE & BARKHAUSEN, Architects & Superintendents, 91 Wisconsin Street.

MILWAUKEE, WIS., Dec. 1, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen:—I have ridden one of your tires for about 2,500 miles and am well pleased with it. Have had no punctures nor any other trouble with it and my business takes me into all sorts of places, alleys, etc., full of glass, nails, etc., but I never pay any attention to any of them and have had no trouble as yet.  
Yours truly, (Signed) CHAS. D. CRANE.

NORTH MILWAUKEE, WIS., Dec. 1, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen:—Your favor of recent date at hand, and in reply will say that I am only too pleased to give my opinion of the tire which has carried me over 900 miles without a single puncture. I think puncturing your tire is all out of question. Furthermore, I think that they are very much easier riding than any other tire. I would not be without them at any price.  
Yours truly, (Signed) H. BATCH.

Representatives Wanted. Write for Prices and Other Information.

**MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS., U. S. A.**

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## BICYCLES WITH AN ALIAS

Bicycle manufacturers have always found it a thankless undertaking to attempt limiting their customers among jobbing houses to any given territory in regard to the reselling of the manufacturers' products. A jobber in St. Paul, Minn., and another in St. Louis, who buy the same manufacturer's bicycles under two different names, but of identical construction, are most likely to clash in the state of Iowa, for example; or in any other territory whither the traveling representatives of both firms penetrate.

This clashing regulates itself so far as the jobbers are concerned, but otherwise for the manufacturer and for the dealer. The latter who has perhaps given a big order for the Blaque bicycle from St. Paul is approached by the drummer from St. Louis who offers him the Phoenix at a lower price, and investigation discloses the absolute identity of the two models, barring the nameplate. It is evident to him that competitors in his own and neighboring towns will be in position to underbuy and to undersell him, and he consequently straightway countermands his first order if he can. Further than this, he most probably resolves to order bicycles henceforth only from those manufacturers who sell to retail dealers exclusively.

Much of the trouble arising from such cases is manifestly due to the two-fold nameplate. If the manufacturer would refuse his sanction to the alias—freely translated; another name in another place—jobbers would almost necessarily manage to steer clear of each other and retail dealers would not necessarily look upon the manufacturer as a culprit caught, even if they are always inclined to consider any manufacturer who does not market his goods under a system that protects the retailer, as a good man gone wrong.

Says a dealer who writes to the Cycle Age on this subject:

We have cancelled the order from the former firm and asked them what kind of protection we shall have. We are a very small "fry" to be kicking, but how would it seem to be placed in the retail trade's position?

Is there any other kindred industry in which a financially sound manufacturer who sells to the wholesale trade does not insist upon having his manufacture recognized under one name for one article wherever it goes? And if he consents to an alias, will not his financial standing soon be doubted and his trade dwindle?

## DEALERS ON THE LOOKOUT

It may be said in favor of the cycle shows which have been held this year and of those which will be held, that they all serve the purpose of reminding the retail branch of the cycle trade of the possibilities which may be in front of it in regard to the retail marketing of motor vehicles.

It was learned from several among the western cycle dealers who visited the New York show that they would not have undertaken the journey if it had not been for their desire to investigate motor vehicles and see with their own eyes to what extent mechanical wagons may be considered practical and salable in a community where knowledge of their construction, virtues and shortcomings is necessarily limited to hearsay evidence.

The results arrived at are now seen cropping out in the columns of country newspapers in the form of interviews with the returned investigators in which it is particularly pleasant to note the tone of conservative intelligence displayed by them.

They are not by any means blind to the limitations of the various types and, if anything, overestimate the troubles that may arise from breakage and repairs of gas engine vehicles. It is clear to them that hill-climbing qualities, such as are indis-

pensable for all-around travel in country districts, should not be looked for in vehicles in which the driving power is very heavy in comparison with the "pay load." But after all the main conclusions may be summed up in the words of one of these cycle dealers who is quoted as saying:

The dealers who make the trip at the same time as myself are eagerly watching every move in horseless carriage development, as we expect it to prove the next expansion of our business.

The Cycle Age has for nearly a year shared this opinion—with all the reservations which the financial condition of the motor vehicle industry and the cycle trade call for—and has given a great deal of space to preparing the trade for approaching the new line with full knowledge of all the problems with which motor vehicle builders must contend.

Now the time is drawing near when the opportunity for applying any knowledge he may possess to practical business may at almost any time be offered the enterprising cycle dealer, and it is hardly necessary to advise him to round off the impressions which he has already received through the pages of this paper, by following the example of those to whose journeying reference is made above.

## SUMMER MONTH AGENTS

The ideal condition for the retail cycle trade would be that which secured to each dealer his proportionate share of business and a guarantee that his vocation would not be rendered unsafe by the unexpected appearance of marauders during the active selling months. The futility of wishing for such a happy condition, however, is nicely illustrated in the following communication from a Pittsburg agent, who laments that he ever fancied the severity of last year's competition would act as a check upon the enthusiasm of aspiring newcomers:

When the retail season of 1898 was drawing to a close there were many dealers here who abandoned their stores and said that they were out of business for good. The few who remained thought they would be in clover this season owing to the retirement of competitors, but as it looks now there will be a lot of new firms engaged in the scramble for trade, at least for four or five months. Well-established dealers deplore the entrance of these new firms into a field from which others were reluctantly compelled to retire, for they foresee a repetition of the conditions which forced their predecessors to vacate.

It is from the people who go into business for four or five months the trade suffers most. Not only are they themselves hurt, but those who are in business all the year around as well. If this sort of thing is to continue manufacturers will get the worst of it, for they cannot depend for support upon men who hop into the business for a few months and then hop out of it again for seven or eight months. If recognition of this evil is not forthcoming by makers in general it is quite likely that the hardware and harness dealers, who are just now being sedulously cultivated by traveling men, will leave the latter to the more agreeable work of scratching the acquaintance of people who, to say the least, are unsound because they are not firmly anchored.

Overcrowding of agents is one of the natural results of overcrowding of makers, each one of whom is but too anxious to secure representation in a town where others are already well entrenched. Salesmen from factories aim to get the best representation possible for their houses, and when their goods are barred from the floors of such stores as command the bulk of local patronage, they turn to people who are willing to enter the lists of retail competition, and immediately there is a weakening all around.

If credits are carefully examined at the factory, no great harm can immediately result from an increase in the number of agents, provided the increase is not out of proportion to the population and common prudence is exercised in selling. After all is said and done, the much-discussed and much-deplored increase in the number of agents will eventually find its own remedy—perhaps in a policy which in self-defense makes it compulsory upon firmly established agents to handle many models instead of a few.

\* \* \* \*

Probably it would not injure the cycle trade if all its manufacturers of note should become prominently identified with a movement looking to something beyond profit-mongering in the narrowest sense of the word, and among the propositions which have been advanced the following, in the words of A. G. Spalding, seems well worthy of attention. He is quoted saying:

I believe that the time has arrived when the bicycle manufacturers of this country, and in fact I may say the makers of all vehicles, should meet in an annual convention to consider ways and means looking to the advancement of road making throughout the United States.

## BRAZING BY IMMERSION

### Frame Cleaning Methods Are Wrapped in Much Mystery When Anti-Flux is Not Used

Whether frame joints should be made to suit the brazing process or the brazing method should be adapted to the frame joint is a question which was answered in favor of the first proposition a couple of years ago when two or three manufacturers found themselves compelled to abandon certain forms of flush joints because it proved impracticable to braze them with any assurance that the work was done when it appeared to be done.

#### Air Vents for Closed Joints.

The same question is now repeated with reference to dip brazing as a sort of objection to the method, on the ground that certain forms of joints are so constituted that air pockets will form in them and prevent the penetration of the molten spelter unless special air vents are drilled at suitable places in the tubing, or that the superfluous spelter cannot flow back into the crucible, or that screwthreads cannot readily be protected against a spelter deposit.

As a general rule the same joints which present these difficulties with dip brazing must be handled with such extraordinary skill if flame brazing is employed that the prospect of getting them brazed at all properly is much smaller than regard for the safety of cyclists would require. And therefore, if dip brazing otherwise continues to be found desirable from the points of economy and workmanship, it seems much more probable that the joints which are unsuitable for the process will be abandoned than that a process will be abandoned which is preferable for all other and better, joints.

#### Cleaning Frames or Preventing Deposit.

Manufacturers who have pinned their faith to any of the styles of tube connections which are troublesome and have trained a crew of workmen to braze these connections by the old method until finally obtaining acceptable results, are naturally loath to acknowledge any virtues in a process which, if adopted by them, would render a change of any of their favorite styles of joints advisable, but while they are hesitating at the starting point, which really presents no difficulties, their competitors are working away at that which is the only really serious problem in connection with dip-brazing, viz., the economical removal of the brass film from the exterior of the tubing or the prevention of deposit on any part of the frame where spelter is not required.

For these more advanced manufacturers it is already beyond question that dipping makes by far the most reliable union and that spelter, molten and kept at a uniform and suitable temperature, may be absolutely depended upon to enter into the smallest as well as the largest air spaces between metal parts held under the level of the molten mass, if only an upward escape for air is provided while the spelter enters from below.

So firmly proved is this assumption that some manufacturers entirely dispense with flux and care nothing for capillary attraction, the two factors which are so indispensable for flame brazing and yet so hard to control.

Not flux nor flow nor deposit of the spelter troubles the dip brazer of experience, but anti-flux, limitation of flow and removal of deposit.

The accompanying illustration shows something of what may be accomplished

by purely automatic means in the way of cleaning a frame which has been dipped, so as to prepare it for enameling or nickeling or both. The frame to the fore in the picture has been subjected to an alkaline bath by which most of the rugosities of spelter deposit have been removed.

So says the manufacturer who dipped it; but manufacturers must be pardoned if they don't tell all they know on this subject. If they have reached results which are satisfactory to themselves, they are not anxious to give others the benefit; and if they are still in the dark they don't desire particularly to advertise that such is the condition of their minds. Mystery is their policy; filing their last resort; and meanwhile they are

The joints of the outer frame in the picture were cleaned in a bath; the joints in the under frame are coated with spelter.

experimenting with every imaginable expedient for rendering filing unnecessary, and find it no hardship to keep a stiff upper lip, inasmuch as the process of filing the comparatively smooth deposits which result from dip brazing at the proper temperature of spelter, is after all less costly than the removal of clots and lumps that usually remain around the edges of joints after the flame brazer has done his work.

The other frame in the illustration represents the condition before anything has been done to smoothen the surface after its spelter bath. No anti-flux has been used to prevent deposit.

#### Anti-Flux Not in Favor.

The use of anti-flux in dip-brazing will some day, when facts shall have been learned, require a separate chapter in description of the art. At present reports are very contradictory and of a controversial character as to the merits of various graphite preparations. It seems that a majority of manufacturers prefer to

dispense with anti-flux of any kind, except where it is necessary in order to protect screwthreads—as in many styles of bottom brackets whose makers still consider it permissible to screw the cups directly into the frame without an intervening shell for the bearing posts.

Whether anti-flux is used or not there is always some use for the emery belt, the steel brush, the sandblast, the filer, the buffing wheel, or other forms of mechanical abrasion, if it is intended to do enameling of high grade on the frame, but it may be hazarded as a guess that this work is often reduced to a minimum when a superfine finish is not required.

Pickling the frames in an acid bath is talked of considerably as the most effective and cheapest method for making the filer's work easy and it is contended that any danger which may be courted by this process in the way of injuring the steel tubing is more than balanced by the reduced chance of injuring it by filing. It is said that in a factory where filers formerly touched elbows at the bench they are now about ten feet apart by virtue of certain vats in which the frames remain about 45 minutes and from which they emerge with the spelter coating entirely removed with the exception of a

small lump here and there where the brass was thickest. The method should certainly have the advantage of uniformity in results.

Electrolytic baths have also been considered, the idea being to reverse the method used for electro plating, and cause the spelter film to leave the tubing and distribute itself in the bath. It is not known whether it is practicable, but it appears that it would be slow and expensive.

For high grade work in connection with dip-brazing a suitable, quick drying anti-flux, which will not scale off in the bath and which may be easily removed after the bath, still seems to be the main thing as yet unattained, and yet worth attaining.

The German branch of Markt & Co. has been sued by an Austrian concern for selling Hartford tires which bear a trademark similar to that registered by the complainant.

## SPANNERS FOR BICYCLES

### Best Designs for Screwing and Unscrewing Nuts in Cramped Quarters—Round Nuts

To turn a square nut with an ordinary monkey wrench it is necessary to turn fully 90 degrees at each grip in order to get a new hold, unless the operator can get at the nut on all sides, and in close quarters where the handle of the wrench cannot be turned around more than 90 degrees the monkey wrench is therefore useless. With a hexagon nut six new grips can be obtained without changing the position of the operator, and the usefulness of the tool is therefore increased somewhat by using hexagon nuts instead of square ones. The bulkiness of the jaws, however, frequently reduces the angle over which the wrench can be turned to less than 60 degrees, and the tool is again useless. The practical value of a wrench or spanner for bicycle work depends therefore largely upon the number of new grips it will allow for effecting a revolution of the nut from one position of the hand. Square nuts should never be used except where access to the nut is perfectly free and unobstructed by the contiguity of other parts.

#### To Avoid Barked Knuckles.

A monkey wrench can only be used with satisfaction when turned with the jaws foremost, so that the strain on the

loose jaw comes toward the stock. Every mechanic knows this, but riders often disregard it and get marred nuts in consequence. This limitation of the adjustable wrench means something more, however. It means that a monkey wrench cannot be turned over and applied with a new grip at a new angle as can a properly designed spanner with fixed jaws, and by this limitation the monkey wrench becomes useless in all cases when contiguous parts prevent the jaws from being turned all of 60 degrees and also when it is inconvenient to turn the stock 60 degrees at one grip.

Spanners designed as shown in Figs. 1 and 2, with the lines of the working jaws at an angle with the main direction of the handle, have the great advantage over those shown in Figs. 3 and 4, that they may be reversed in the hand after a nut has been turned an angle which is 45 degrees for the square nut and 30 degrees for the hexagon nut, and may then be applied to the same flats of the nut and be again turned 45 and 30 degrees, respectively, so that the nut is turned 90 or 60 degrees while the handle is moved over only half of these angles. With spanners of this description nuts can therefore be conveniently turned on or off, though the space allowed for hand motion is very limited.

In the American bicycle industry the advantages of spanners have been very

generally recognized, so that nearly every manufacturer of bicycles has spanners made specially for the machines of his make, but as a rule it is overlooked that these spanners might be made more useful and that the machines themselves might be built in a more trim style if the

FIG. 3

FIG. 4

reversible design shown in Figs. 1 and 2 were adopted.

The disinclination of many riders to carrying a toolbag has probably much to do with the preference shown for spanners, as the latter are lighter of weight and more compact than adjustable wrenches and may be carried more conveniently in a pocket, but when the manufacturer relies on the spanner furnished with his bicycles to the extent of placing nuts in such manner that they are inaccessible with the ordinary bicycle wrench, he probably commits a mistake, unless he also supplies a leather cover for the spanner and provides for its ready attachment to one of the frame tubes, for every cyclist who habitually leaves his toolbag at home is liable to find, when a spanner is required, that it also has been left at home in his shed or in the pocket of other clothes than those he is wearing. He will then borrow a bicycle wrench and will in all likelihood finish by marring the nuts which were intended to be operated by the spanner only, and spoil them for all futurity, spanner or no spanner.

#### A Place for One Tool.

The same class of riders who object to the regulation toolbag, because it is large

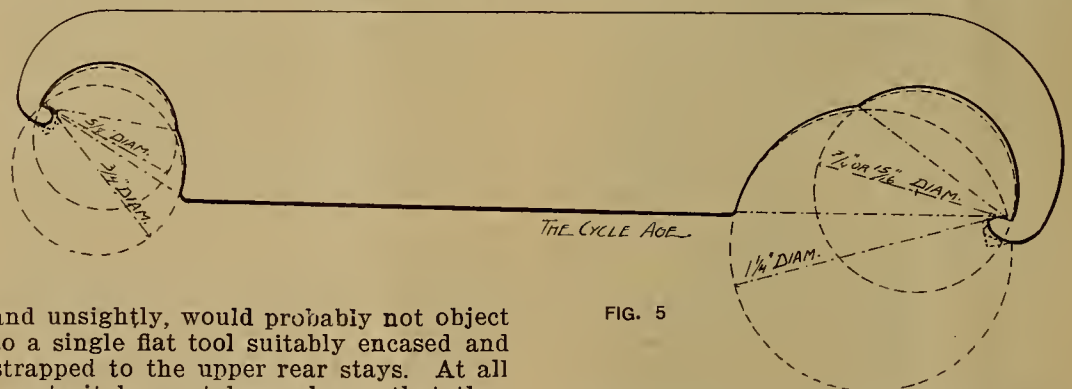

FIG. 5

and unsightly, would probably not object to a single flat tool suitably encased and strapped to the upper rear stays. At all events it has not been shown that they do object, for the practice of providing a permanent place for a spanner, and for it alone, has never become general. Even for those who carry a toolbag it would be a convenience to have all the spanners separately disposed of, as it is the tool which is most frequently in requirement if the manufacturer has taken care to make it fit all adjustable nuts, cones, expanders, etc., on the machine, or, vice

versa, has made the latter so as to be fitted by a spanner of simple design.

Without doing violence to any of the proportions and dimensions of nuts on a bicycle, it is quite within the range of possibilities to fit them all with a single spanner of the simplest design, if all the nuts are made round instead of hexagonal or square and provided with notches or holes in the circumference. And, if the holes are placed close together, the further advantage would be gained by using round nuts exclusively that they could be turned with a very small angle of rotation for the spanner handle on the principle on which an alligator wrench is used. In other words the manipulation of the spanner would be made very convenient to the cyclist, for the same reason that makes the spanner of the design shown in Figs. 1 and 2 more convenient than the common kind, and makes a hexagon nut more convenient to turn than a square nut when there is small room for hand movement.

The objection to round nuts is chiefly that they do not present as finished an appearance when new as nickeled hexagon nuts. In regard to this opinions are divided and on the other hand they will look better when old than a marred hexagon nut. Another objection is the impracticability of operating them with a monkey wrench, if the spanner should be mislaid, lost or left at home. The latter objection is much reduced if a special receptacle is provided for the spanner as before referred to.

#### A Trial Design.

A design of a spanner for round nuts which would presumably fit as many diameters of nuts as there is need for on any one bicycle, is shown in Fig. 5. The small end would fit axle nuts and hub cones and the large end crank hanger cone and cone lock nut and seat post and handle-bar expander nuts. If cotter pins were used, and made no longer than necessary, the cotter pin nuts might be kerfed on top and turned by means of two small lugs on the small end of spanner. If cup adjustment were used the design of the spanner should, of course, be modified to suit the style adopted, but in all cases it would seem possible to devise an instrument which alone would serve all the ordinary requirements of the cyclist for getting at the mechanism of his mount, tires excluded, and which could be conveniently disposed of on the bicycle in a manner to which the most fastidious riders would not object.

#### French Puncture Closing Compound.

Another recipe for making puncture closing liquid comes from Lyons, France, in the form of the specifications of a pat-

ent granted by the United States patent office to Antoinette Lovocat. The composition is as follows: Gutta percha, 1 part; copaiba or other balsam, 4 parts; holly or other bird-lime, 4 parts; Swiss or Bordeaux turpentine, 2 parts; saturated solution of celluloid, 4 parts; chloroform or any other solvent, a quantity sufficient to dissolve the gutta percha and other substances above mentioned.

**THE ONLY EFFECTIVE PROTEST  
SHIPPING BY FAST FREIGHT**

**Cycle Dealers Making Use of Their Only  
Weapon to Induce Lower  
Express Rates.**

When corporations that are already paying 80 per cent annual dividends on their investments and doing business ten times as great in volume as the amount of their actual capital, go to the mean extremity of forcing their overburdened patrons to pay the war tax that was obviously intended to be levied on the business of the corporations, and stubbornly maintain that attitude in the courts, it is evident that the only protest of their patrons against exorbitant charges that will be effective is the transference of their business to competing companies.

This is the conclusion reached by many of the bicycle dealers and repairmen with regard to the express companies, which are virtually organized into a trust to maintain extortionate charges, and the small trade is changing very rapidly to the fast freight service, which, while slower, offers a very material reduction in transportation charges. The sentiments contained in the following letters are characteristic of the feeling of cycle dealers throughout the country:

**Coast Dealers Would Benefit by Freight.**

I heartily endorse the plan of using fast freight rather than express as a mode of shipping, the difference in time being greatly preferred to the extortionate charge of express companies. Especially will it benefit dealers on this coast who are so far removed from the manufacturers.

Oregon, A. P. MORSE

**Has Used Freight for a Year.**

Express charges take at least 25 per cent. of the profit on bicycles and sundries. I have been using freight for about twelve months as margins are too low for me to pay present express charges.

South Carolina, C. D. COOPER.

**Will Use Only Freight Hereafter.**

The proposal to use fast freight instead of express meets with our approval. We used express entirely last year, but will use nothing but freight this season unless express rates change.

Iowa, ALLINE BROTHERS.

**Useless to Ask for Explanations.**

We are "skinned" unmercifully here by the express companies, and I have been so much disgusted with their rapacity that I have frequently determined never to send another article by express. The rates are never twice the same on bicycles from the same place, and it is of no use to ask explanations. When a package comes by express you might as well pay the charges at once and be done with it, as to attempt to get even handed justice done you. I mean to write to the representative of this district in Congress and urge upon him the desirability of a parcels post. I think you are doing a good work and am sure your magazine is doing much that will help to right matters for the people against these companies.

Virginia, J. R. EOFF.

**Cheap Delivery of Freight Shipments.**

My idea would be to do away with the express companies entirely. Improved freight facilities and the permission of the postal department to increase the size and weight of packages to ten or fifteen pounds would work a great benefit to the public and be a source of increased revenue to the government. The parcels post would be a great benefit to the rural districts not now reached by the express companies, for the cheapening of the rates of transportation would create a demand for goods which many people now get along without.

The railroads are common carriers. The government gives them the right of way; gives them permission to go through a man's farm regardless of whether he wants them to or not. Then, when they have the "cinch," they charge all the traffic will bear. I say, give the railroads fair pay for their services, but shut off their profits on watered stock.

Messrs. Carpenter & Male, on page 348 of the Cycle Age, say they cannot use fast freight because the freight is not delivered,

I have a contract with a drayman to receive and deliver my freight; then, when the drayman presents my freight receipts with his charges added, I pay him. Yesterday he delivered three crated bicycles, today he presented the receipted freight bill with only 10 cents added for his services. My freight is almost immediately delivered, after the arrival of the train it is on. If Carpenter & Male will have some such understanding with a drayman or teamster it will help them to patronize fast freight with the rest of us.

South Dakota, L. E. STAIR.

**Varying Rates of Freight Companies.**

The express companies are not the only extortionate chargers, as the railroad companies charge double first class freight on bicycles, which is in my opinion extremely exorbitant, as the time is four times as long by freight as by express. To give an illustration of freight rates on bicycles, I wish to mention that on December 9 I received two bicycles from Toledo, O., at a weight of 90 pounds, and a freight rate of double first class, which cost me \$3.05, in addition to which cartage cost 25 cents, making the charges on the two machines \$3.30. On January 3 I received two bicycles from Westfield, Mass., nearly twice as far as Toledo, total weight 90 pounds, freight \$1.65, cartage 25 cents, making \$1.80 for two bicycles. Why is this and how is it I can receive such low rates from the far east when from the west it is so much more? Here is an important subject for the manufacturers to work on, and I hope they will take hold of the matter at once, and see why bicycles cannot be shipped as simple first class freight.

Texas, MARCH CULMORE.

**In Full Accord With Movement.**

We are heartily in favor of a concerted action to bring down the extortionate charges to a reasonable basis. Whenever we can do so we have our goods shipped by fast freight, avoiding express shipments as much as possible.

Indiana, MUELLER & WATSON.

**EAGER FOR SHOW SPACE**

**American Builders Would Monopolize Bicycle and  
Motor Vehicle Building at Paris Exposition.**

The bicycle and motor vehicle department of the Paris exposition next year promises to be of great importance and, according to the assistant commissioner, the American section will be especially noteworthy. No week passes in which applications are not received from manufacturers for space. All the big bicycle and motor vehicle makers, including makers of motors and bicycle parts, have made requests for space and if each were given all he asks for there would not be an inch of space left for the other nations.

It was at first intended to have only one section devoted to bicycles, motor vehicles, horse drawn vehicles and harnesses, etc., for which 7,000 square meters were to be set aside, half of which were to be used for the first two sections, but it was soon found that the cycle and motor vehicle section would be too small and many protests were made, with the result that it was decided to erect a special building to be called the bicycle and automobile building. This annex is to be erected at Vincennes, adjacent to the exposition, but also close to the municipal track of Paris, where the international bicycle races and athletic contests are to be held.

Preparations for displays in this section are already being eagerly made in all parts of Europe. A suggestion is gratuitously thrown out to American manufacturers that they should be careful to send only their best products, as small exhibits of good wares are preferable to large displays of inferior goods.

The entire plant of S. A. Smith & Co., manufacturers of bicycles, carriages and toys in Brattleboro, Vt., was destroyed by fire February 1. The Smith factory was insured for \$16,000, and was totally destroyed.

**EXPORTS FOR TWELVE MONTHS**

**SMALL GAIN OVER LAST YEAR**

**Shrinkage In Australian Trade—Increased  
Demand from Japan, Argentina,  
Germany and France.**

Governmental returns on the exports of cycles, parts and materials for the twelve months ending with December (1896, 1897 and 1898 in comparison) are here given:

	1896.	1897.	1898.
United Kingdom ..	\$1,306,403	\$2,128,491	\$1,699,127
France ..	135,202	283,910	517,183
Germany ..	303,096	1,378,558	1,636,207
Other Europe ..	484,731	1,110,599	1,362,199
British N. America	575,577	744,889	608,190
Central America ..	75,063	21,295	7,091
Mexico ..	51,887	69,391	57,947
San Domingo ..	1,873	3,939	631
Cuba ..	4,833	8,836	5,286
Porto Rico ..	8,179	4,285	2,631
Other West Indies.	66,016	126,528	72,461
Argentina ..	22,196	52,244	131,624
Brazil ..	22,934	54,082	99,232
Colombia ..	20,904	22,091	7,986
Other S. America ..	42,915	61,303	54,104
China ..	11,278	26,300	27,863
Brit. East Indies ..	10,155	31,583	155,265
Hongkong ..	(a)	7,118	9,355
Japan ..	41,386	80,874	128,752
Australia ..	530,339	445,529	247,146
Other Asia ..	34,784	65,399	79,166
Africa ..	64,266	174,730	181,009
Other countries ....	.....	762	1,739
Total ..	\$3,796,022	\$6,902,736	\$7,092,197

**Exports for the Month of December.**

The official returns for the month of December (1897 and 1898 in comparison) are as follows:

	1897.	1898.
United Kingdom ..	\$ 87,300	\$ 67,913
France ..	24,686	37,947
Germany ..	178,643	161,930
Other Europe ..	47,773	177,594
British North America	23,406	27,709
Central America ..	727	404
Mexico ..	5,450	3,129
San Domingo ..	24	33
Cuba ..	574	790
Porto Rico ..	317	70
Other West Indies ..	8,771	6,941
Argentina ..	6,046	18,598
Brazil ..	9,071	5,494
Colombia ..	2,131	614
Other South America ..	4,687	6,916
China ..	874	1,542
British East Indies ..	3,878	12,831
Hongkong ..	289	66
Japan ..	8,450	3,127
Australia ..	21,091	26,439
Other Asia ..	2,340	10,051
Africa ..	21,146	16,238
Other countries ..	.....	40
Total ..	\$457,674	\$586,416

**The Week's Exports.**

Exports of bicycles and bicycle materials from the port of New York for the week ending February 7 are recorded as follows:

	Bicycles.	Mtls.
France ..	\$24,450	\$ 3,921
Germany ..	8,095	11,924
Russia ..	9,235	10,336
Canada ..	.....	16,097
England ..	4,527	3,616
Holland ..	6,977	2,058
Sweden ..	2,508	701
Denmark ..	820	2,058
British West Indies ..	1,170	847
Argentine Republic ..	1,612	169
Scotland ..	.....	1,466

Other South America ..	73	13
Ireland ..	13	.....
Totals ..	\$62,791	\$56,075

**Steel Bands Instead of Chains.**

The English cycle trade is just at present deep in the throes of a discussion concerning the merits of a steel band as a means of power transmission in bicycles.

## COMMERCE IN FOREIGN MARKETS

**OUR BICYCLES IN RUSSIA**

A report upon cycles from and were quite satisfactory, except as to price. Soon the better class of American machines made their appearance, and later the cheaper German goods came in. Large numbers of the German bicycles are being sold, mostly on the installment plan. American machines are much liked, but as only the high-priced ones have been introduced so far, the cheaper goods of German manufacture find more purchasers. In St. Petersburg American bicycles are the most popular, those from Germany standing second, and those from England third in favor. The most popular machines in Moscow are English.

The ruling prices at retail for machines made in Russia vary from \$80 to \$95; for English machines, \$90 to \$110; German, \$70 to \$90, and American, \$50 to \$100. Most of the imports of cycles are from Germany and Great Britain. The greater part of the business is done in March and April.

The roads in Russia are rough, and the report states that extra strong pneumatic tires should be placed on all grades of machines. They should also be equipped with mudguards and brakes to suit the Russian trade. It is absolutely necessary that catalogues, price lists, etc., be printed in Russian if it is desired that they should be read. The metric system should also be employed.

The number of representatives of American firms and corporations that visit Russia is increasing annually. Among those more prominent who were represented during the past year were Pratt, Whitney & Co., Indiana Bicycle Co., H. A. Lozier & Co., Stover Mfg. Co., and other bicycle companies, who carried home large contracts and expressed satisfaction with the results of their visits.

**AUSTRIAN CYCLE TRADE CONDITIONS**

Bicycles are largely used in Austria, but their use is not so general as in England or America. The condition of the roads varies according to the seasons, and when the weather is favorable they are very good. There are some domestic manufacturers of bicycles. Machines are also imported from Germany, England, France and the United States. The receiving port is Trieste. Port charges are about one cent per 100 pounds and clearance papers cost about 8 cents. The number of bicycles cleared does not increase the charge. There are bonded warehouses in Trieste. Goods sent there should be securely packed in closed cases and bright parts should be well greased to prevent rust. Bicycles should be packed three in a crate, wheels detached. The American bicycles sold in Trieste are as follows: Cleveland, Eldridge, Rambler and Monarch.

**ORIGIN OF GERMAN GOODS**

The progress in many of the leading branches of manufactures which has taken place in the German empire during the last decade is wonderful. Germany is making enormous strides, notably in those manufactures in which superior knowledge, technical skill, and the agency of the expert in chemistry or other sciences can be brought to bear. This is true to a remarkable degree in the elec-

trical trades and in the cognate branches of electrical engineering.

The foreign-trade policy of the general government had hardly commenced to develop twenty-five years ago, if it can be said that it existed at all. When the attempt was made at something of an exhibit at Philadelphia in 1876, the director of the Berlin-Charlottenburg technical high school, upon his return, reported German manufactures, in comparison with those of other countries, cheap and poor in quality, which gave rise to the expression "cheap and shabby" and brought down upon his honest head fierce criticism by the German press. But the German manufacturers who had visited Philadelphia felt the truth of his judgment, and his words proved the sharpest spur for renewed efforts to the better.

**TARIFFS ON CYCLES AND PARTS**

Tariff charges on American bicycles and parts are shown in the appended table. In such countries as the duty on parts is not specifically given it is to be understood that the tax on bicycles applies to parts, etc.

Antigua . . . . .	10 per cent plus 33 1-3 per cent of duty.
Argentina . . . . .	25 per cent ad val.
Austria . . . . .	\$12.50 per cycle.
Austria . . . . .	\$6.09 to \$6.90 per 220 lbs parts.
Bahama Islands . . . . .	\$1.25 per cycle.
Barbadoes . . . . .	10 per cent ad val.
Bavaria . . . . .	3 cents per lb.
Belgium . . . . .	12 per cent ad val. cycles.
Belgium . . . . .	15 per cent ad val. lamps.
Bermuda . . . . .	\$2.41 per cycle.
British Guiana . . . . .	10 per cent ad val.
British Honduras . . . . .	10 per cent ad val.
Bohemia . . . . .	\$12 per cycle.
Bolivia . . . . .	35 per cent ad val.
Brazil . . . . .	\$7 per cycle.
Bulgaria . . . . .	8 1/2 per cent ad val.
Caicos, W. I. . . . .	Free.
Canada . . . . .	30 per cent ad val. cycles.
Canada . . . . .	25 per cent ad val. tires.
Canada . . . . .	30 per cent ad val. bells and lamps.
Cape Colony . . . . .	9 per cent ad val.
Ceylon . . . . .	6 1/2 per cent ad val.
China . . . . .	Free.
Colombo . . . . .	3 cents per lb.
Congo Free State . . . . .	6 per cent ad val.
Costa Rica . . . . .	20 per cent ad val.
Cuba . . . . .	\$4 per cycle.
Cyprus . . . . .	8 per cent ad val.
Denmark . . . . .	10 per cent ad val.
Dominican Republic . . . . .	\$10.05 per cycle (men).
Dominican Republic . . . . .	\$5 per cycle (children).
Dutch Guiana . . . . .	Free.
Ecuador . . . . .	5 cents per lb.
Egypt . . . . .	8 1/2 per cent ad val.
Fiji Islands . . . . .	5 per cent ad val.
France . . . . .	22c per lb.
Gambia, W. Africa . . . . .	7 1/2 per cent ad val.
Germany . . . . .	\$5.71 per 220 lbs.
Gold Coast, W. Africa . . . . .	Free.
Greece . . . . .	\$1.93 per cycle.
Grenada . . . . .	7 1/2 per cent plus 10 per cent of duty.
Guatemala . . . . .	15 cents per lb.
Hawaii . . . . .	10 per cent ad val.
Holland . . . . .	5 per cent ad val. cycles.
Holland . . . . .	5 per cent ad val. parts.
Honduras . . . . .	6 cents per lb.
India . . . . .	5 per cent ad val.
Italy . . . . .	\$8.12 per cycle.
Jamaica . . . . .	12 per cent ad val.
Lagos, W. Africa . . . . .	5 per cent ad val.
Liberia . . . . .	12 1/2 per cent ad val.
Japan . . . . .	25 per cent ad val.
Korea . . . . .	7 1/2 per cent ad val.
Luxemburg . . . . .	3 cents per lb.
Mauritius . . . . .	10 per cent ad val.
Mexico . . . . .	2 cents per lb.
Montserrat . . . . .	10 per cent plus 15 per cent of duty.
Morocco . . . . .	10 per cent ad val.
Natal . . . . .	5 per cent ad val.
Newfoundland . . . . .	30 per cent ad val.
New South Wales . . . . .	Free.
New Zealand . . . . .	20 per cent ad val.
Nicaragua . . . . .	\$1.90 to \$2.15 per cycle.
Northern Territory . . . . .	15 per cent ad val.

Norway . . . . .	\$8.10 per cycle; juveniles, 67 cents each.
Norway . . . . .	34 cents per lb. fin. parts.
Nova Scotia . . . . .	30 per cent ad val.
Persia . . . . .	5 per cent ad val.
Peru . . . . .	45 per cent ad val.
Philippine Islands . . . . .	\$4.50 per cycle.
Portugal . . . . .	27 per cent ad val.
Queensland . . . . .	15 per cent ad val.; parts free.
Roumania . . . . .	\$1.55 per cycle.
Russia . . . . .	\$9.24 per cycle.
Russia . . . . .	16 2-3 cents per lb. detached parts.
Salvador . . . . .	25 cents per lb.
Saxony . . . . .	71 cents to \$1.19 per cycle.
Servia . . . . .	\$5.79 per cycle.
Siam . . . . .	3 per cent ad val.
Sierre Leone . . . . .	10 per cent ad val.
South Australia . . . . .	25 per cent ad val.
St. Christopher . . . . .	10 per cent plus 10 per cent of duty.
St. Lucia . . . . .	15 per cent plus 15 per cent of duty.
St. Vincent . . . . .	10 per cent plus 10 per cent of duty.
Spain . . . . .	6 1/2 per cent per lb.
Sweden . . . . .	\$6.70 per cycle.
Sweden . . . . .	25 cents per lb. parts.
Switzerland . . . . .	7 cents per lb.
Tahiti . . . . .	32 per cent ad val.
Tasmania . . . . .	20 per cent ad val.
Tobago . . . . .	5 per cent ad val.
Trinidad . . . . .	5 per cent ad val.
Transvaal . . . . .	27 per cent ad val.
Turk's Island . . . . .	Free.
Tunis . . . . .	8 per cent ad val.
Turkey . . . . .	8 per cent ad val.
United Kingdom . . . . .	Free.
Uruguay . . . . .	40 per cent ad val.
Venezuela . . . . .	7 cents per 100 lbs.
Victoria . . . . .	10 per cent ad val.; parts free.
Virgin Islands . . . . .	10 per cent ad val.
West Australia . . . . .	15 per cent ad val.

**SENDING CATALOGUES TO GERMANY**

In all cases postage on letters, circulars, etc., should be fully paid. When not fully paid the recipient is charged double rates on the amount due, and this often results in his refusal to accept. Letters should be plainly addressed, for very few of the German postoffice officials can read English, and addresses ought therefore to be as plainly written as possible, so as not to increase the difficulty.

The German will purchase his home product, unless our people can offer him unusual advantages in the way of price or quality. Just now, he is a little sore because a large American trade, built up under the Wilson tariff, has been sadly reduced by the Dingley tariff and the war, and he is not disposed to buy where he can not sell; but the feeling can be overcome. The hostility felt toward Americans during the war, as expressed in the newspapers, is being replaced by a more friendly feeling.

**SPACE AT PHILADELPHIA'S EXPOSITION**

The directors of the Philadelphia Exposition Co. recently held their annual meeting and decided to open the exposition on or about September 15 next and close it on or about November 10, the exact date being left to the discretion of the executive committee. Another important action was the fixing of the price to exhibitors for space in the exposition buildings at an average of \$1 per square foot. It was stated that good progress is being made in procuring subscriptions toward the \$50,000 which is to be added to the \$250,000 obtained from the city of Philadelphia and the state of Pennsylvania. When this sum is raised an appropriation of \$300,000, conditionally made by Congress, will become available.

The Berlin parcel post is largely distributed by tricycle.

## DEALERS FEEL TRADE PULSE

### Lowered Prices of Standard Bicycles Will Increase Sales, Especially in the Country

One effect of the reduction of list prices on the standard bicycles made by reputable firms, as noted two weeks ago, will be the increased sale of the better class of machines in proportion to the cheaper and less reliable goods, according to the consensus of opinion of the agents throughout the country. Another result quite as important is the effect the reduction will have on country sales. Heretofore the farming element has practiced economy and largely bought second hand and low priced machines rather than pay \$75 to \$100 for the best makes. This year, however, the difference between the prices of standard reputable makes and bicycles without nameplates is so small that the country folk, now in better financial condition than for a number of years, will prefer to pay the difference and feel that they are riding as good bicycles as are made. This is the belief of many dealers located in the west and northwest who are in the best position to anticipate the country trade of the coming season.

The following letters show the feeling among the retail trade in various states:

#### Prospects Decidedly Encouraging.

I think more bicycles will be sold this season than in '98, because there seems to be more money in the country at present than there was at this time last year; also collections are coming in better and more mortgages have been cleared. The lowered list prices will increase the demand because we can get people to buy at \$35 that would not at \$50 or \$75. Dealers are buying more freely, according to the statements of the traveling salesmen.

Ohio.

H. F. WHITE.

#### Industrial Conditions Will Help Sales.

We believe that people in this town will buy more bicycles than last year because work is more plentiful and people have more money. The price is now getting to where it ought to be, and will no doubt help the sale of bicycles. So far as we know, dealers are not buying any larger quantity to start out with.

Ohio.

FRANK H. SNYDER.

#### Lower Prices Will Influence Buyers.

My trade in '98 was good, and from all appearance I do not think it will be any better this year, although I expect to make as many sales. The lowered list prices will help the trade by bringing bicycles within the reach of all and enabling them to purchase. I do not believe that for the first purchase dealers are buying any more than usual.

Indiana.

A. R. GROVE.

#### Public Understands Bicycle Values.

In my judgment the number of machines sold will be greater during 1899 than last year, or, in fact, any former year. All grades of machines are cheaper, and while I do not claim that the general prosperity is unloading money in the laps of all the people, I still think the greater purchasing power of money in this line of trade will make it easier for all the people to buy. The lower prices on the first-class goods is having its effect in the sale of reputable machines, and I find that I have already sold more machines up to date than I ever sold before so early in the season, and all of them, or nearly all of them, of the better grades. The people are now well educated in the values of the different makes of bicycles sold in this city. I cannot see that my competitors are buying more freely than in former years, but I certainly am doing so, as I wish to get well stocked up early, so as to be "in out of the wet."

Michigan.

E. C. ADAMS.

#### Trials of Dealers in Small Towns.

I think the sales will not exceed those of last year; very likely they will be about the same. I know of some instances in which old, experienced agents have gone out of the business, where they were situated so they could do so, on the ground that there are not sufficient returns for the bother and express on broken parts and other expenses,

which sometimes have to be borne by the agent, because of the low prices, which compel the agents in towns of less than 10,000 to carry bicycles as a side line only. To hold customers for other trade they are obliged to stand repairs and expense which they ought not to. This has a very demoralizing effect on the whole trade and the large manufacturers who are making efforts to squeeze the small ones out are not going to get off entirely free from the effects of their own efforts. Dealers seem to be buying about the same as last season. People here seem to look with suspicion on the cheap machines.

Michigan.

C. B. BUCKBEE &amp; Co.

#### Cheap Bicycle Trade Will Suffer.

I am now out of the bicycle business myself, but I still feel a friendly interest in the old line. Dealers here are buying less stock than a year ago, and I hear little talk about the new lines. My impression is that retail trade will be less than in other years. The new prices on old standbys will cut seriously into the new cheap bicycle trade.

Michigan.

F. L. COLBY.

#### Anticipates Fewer Sales.

I think the sales of bicycles will be less this season than last, though it is hard to tell. There does not seem to be as much bicycle talk as heretofore. The lowered list prices should have a good effect, judging by the way people have bought here in the past, having purchased mostly cheap machines. Dealers are buying about the same as usual.

Michigan.

C. H. PARSONS.

#### Expects Trade to Remain Constant.

I think the sales will be about the same as in '98, but on account of the lowered list prices there may be a few more machines sold. The poorer classes can afford bicycles now, when they could not before. Dealers will buy about the same this season as usual.

Illinois.

C. B. BUTLER.

#### Is Early to Estimate Sales.

It is hard to determine so early in the season, but I have no reason to think that sales will be less than in '98. As the price is lower, I think they may be greater. The season is young, and I do not know of any purchases as yet. I have some sales in view, but have not bought any goods yet.

Illinois.

S. H. CREET.

#### Think Purchasers Are Well Supplied.

Perhaps sales will not be as large this year as last. The lowered price list will have practically no effect in this locality, and dealers are not buying any more freely than usual. There have been very large sales of bicycles here for several years and it would seem as though almost everybody must have been supplied. There has been small sale here for high priced machines; people are satisfied with the \$35 to \$40 goods.

Kansas.

R. H. ROYS CYCLE Co.

#### Lower List Will Sell Better Quality.

Sales will be as good, if not better this year than last year. The lowered list prices will create a larger demand for high grade goods. Dealers are buying more freely than last year.

Texas.

GEO W. BEARDSLEY.

#### Dealers Buying Conservatively.

Sales at this point for the coming season, in our judgment, will not exceed those of last year, the effect of lower prices being to just about bring the total to balance the previous year's sales. The dealers in this neighborhood are very conservative regarding '99 purchases. There is little competition here and we are taking things very easy.

Texas.

ENNIS CYCLE Co.

#### Preparing for Better Business.

The sale of bicycles will be greater this year than in '98, as effect of lowered list prices will be that more people believe now that they can buy. We have been buying more freely this season, but don't know about the other dealers.

DIAMOND SUPPLY Co.

#### Post Dating and Long Credits.

The dealer is frequently injured by post-dating and long credit. A salesman

representing a long-time jobbing house succeeds, by the inducements of post-dating and four months' time, in selling the retailer about twice as much as he ought to buy. Too frequently the retailer does not recognize this fact until he has received the invoice. Then he becomes alarmed. He is seized with the fear that he will not be able to dispose of enough goods to be able to pay the bill by the time it falls due. In his anxiety of mind he takes risks. He sells to customers on time, even making credit sales that he would not have thought of making had he bought his goods as he needed on short time or for cash. The usual result is that when the post-dated bill falls due, the merchant has neither the money to pay it, nor yet the goods on hand. Accordingly, he is either compelled to ask for an extension or to borrow the money with which to pay the bill. The long-time, post-dating wholesale houses are an actual injury to the trade, and the real enemy of the average retail merchant, while on the other hand the cash houses are his true friends. The retailer that buys for cash and sells for cash seldom fails.

#### Dealers Oppose Cycle Tax.

Washington, Feb. 11.—Local bicycle dealers are vigorously opposed to any legislation looking to the imposition of a tax on bicycles, and have prepared a letter setting forth their views on the subject. In the course of their letter the dealers say: "In our opinion, a tax on bicycles is an unfair and unjust discrimination against the owners of such vehicles. We consider any public or private conveyance much more amenable to such a tax, as horses and wagons certainly inflict greater injury on streets and roadways than the bicycles. A tax of \$1 each would be entirely out of proportion to the value of the bicycles now in use, considering the lower list prices and changed conditions of the trade. As dealers, we have further ground for objection to such a bill, considering the fact that we require the bicycles for trial purposes, employees' use, and rental stock; this being the case, a tax imposed on bicycles would force us to contribute more than our share toward the revenues of this District. We are required to pay on personal property, so that if this bill should become a law we would be paying double tax on the same articles."

The dealers have appointed a committee to wait upon the District commissioners and represent their views on the contemplated legislation. Many prominent cycle manufacturers have given their support to the movement to defeat the proposed legislation. In accordance with the usual practice of the commissioners, a hearing will no doubt be granted to the dealers.

#### Cleaning Store Windows.

A correspondent advises the Iron Age in regard to a method of cleaning windows which experience has taught him is far ahead of the window brush and rubber idea. The plan is to put into a cheese cloth sack about ½ pound of whiting. A clean cloth wet enough to hold in the hand without dripping water and a clean old muslin cloth are the other requirements. The whiting bag is drawn over the window, followed by the damp cloth, when the window is polished with the clean cloth. The description of the three applications may leave the impression, he remarks, that it will take a long time to clean the windows, but his experience has been that the ordinary boy who requires from one to two hours for cleaning a pair of windows with a brush and rubber can do the same job by the above method in from twenty minutes to half an hour.

## SUBJECTS OF GENERAL INTEREST

THEORY OF  
PYRAMID  
CONSTRUCTION

The construction of the Egyptian pyramids could have been performed by means of inclined planes of earth. Let us suppose that each of the stone blocks used had a rectangular base, being half as thick as wide, and that they were moved from the quarry on rollers. Other stone blocks could then have been transported along the surface of the ground in the same manner and so could the other stones in the same tier. An embankment at a 20 or 30 per cent. grade could then have been constructed by carrying earth from pits beyond the continuation of the boundary lines of the base of the pyramid. Over the surface of this plane, extended toward the quarry, the second tier of stones could then have been put in place; a new embankment could then have been constructed, and new blocks and those behind them being put in place; and so on, by the aid of the additions to the embankments, the remaining stones could have been put in position.

The highest embankment necessary when the workmen reached the top course, assuming that a 20 per cent. grade was adopted, would have been 750 yards long, containing about 7,500,000 cubic yards, if the sides of the earth embankment would stand at an angle of 30 degrees, which is not at all improbable.

Assuming that one laborer could have placed two and one-half yards (about twenty barrow loads) of earth on an average each day on this embankment, 10,000 men could have built it in twelve months of twenty-five working days. It is stated that 100,000 men were employed for twenty years in the whole work, so that, according to this calculation, the construction of this embankment would have occupied only a small portion of the total time consumed.

The false work to support the walls of the interior chambers of the pyramids could also have been made of earth rather than of timber.

ON  
WHEELS

A most unusual kind of schoolhouse is owned and operated by the Westinghouse air brake company. It is made up of three cars and has traveled more than fifty-five thousand miles. It is fitted with every appliance for instructing the pupils in the use of the Westinghouse brake system, and has its principal and its competent teachers.

When the Westinghouse brake was invented and applied to steam railroads it was found to be the best thing of its kind ever invented, provided it was properly handled. It is automatic in its action, but the best results could not be obtained without a competent man at the throttle, who understood perfectly just what results would be obtained with a certain amount of pressure. It was this fact that led to the establishment of the schoolhouse. It was the idea of getting the best results out of the brake, and therefore insuring greater safety to the passengers and a saving of property to the railroads and shippers, that was the inspiration of this remarkable school.

The instruction car is equipped with the full number of air brakes, number of feet of piping, couplings, auxiliary reservoirs, etc., to equip a freight train of thirty cars; and also to equip a passenger train of fifteen cars fitted with the whistle signaling device. The instruction car

weighs 135,000 pounds, and is one of the heaviest cars that ever traveled the rails of a railroad. More than 112,000 railroad men have received instruction and have been examined as to their competency.

MARVELOUS  
BROAD  
JUMPER

Athletes have been startled by the wonderful broad jumping performances of W. J. M. Newburn. This athlete now holds the record of the world, twenty-four feet six and three-quarters inches. Had it not been for the fact that this great athlete cleared over twenty-four feet in public six times last summer, on different grounds and under different conditions, it is doubtful if on this side of the Atlantic athletes would admit the genuineness of his best performance. There are only about eight jumpers who have ever cleared twenty-three feet or over.

Newburn stands 6 feet 6 inches in height and weighs 208 pounds. He starts with his run about 150 feet back from the take-off, and approaches rather slowly a certain mark, about ninety feet away from the take-off. On arriving at this mark he has given enough momentum to his body to have quickened his speed, which he does after getting the foot with which he jumps at this mark. His strides after leaving this mark increase in length as his speed increases, and the last three or four measure over ten feet in length, for by this time he is going at his utmost speed. The stride just in front of the take-off is not over seven feet long, for he must gather himself then for the jump, and if he put his jumping foot too far in front of him he would more or less retard his momentum. When Newburn leaves the ground he gets a great "rise" and literally sails through the air. Just before landing it would seem that his feet were going to touch, when he tucks them under him, and their being handled so gives the uninitiated an impression that he is taking a second spring. Then when his head and shoulders are so close to the ground that he can postpone the inevitable no longer he shoves his feet in front of him, and the momentum of his whole body carries him forward and prevents falling back.

Like nearly all of the best running broad jumpers, Newburn is a fast sprinter, and has been credited with running 106 yards in ten seconds. His stride when running his fastest in this race is from 10 feet 3 inches to 10 feet 5 inches, and he is the longest striding athlete ever heard of since athletic sport has been chronicled. He is a professor in Claremont college, Dublin, and practices his athletics solely for health.

ENGLAND'S  
IMPERIAL PENNY  
POST

What is described as John Bull's Christmas present to the world, or more particularly to the British Empire, is the inauguration of the imperial penny postage, which occurred on Christmas day in accordance with a treasury warrant published in the Official Gazette, establishing a rate of 1d (2 cents) per half ounce or fraction of half ounce on letters posted in the United Kingdom for transmission to specified British colonies and possessions.

Cape Colony is not included, although Natal is, nor have the Australasian colonies been brought into line as yet; but it is generally believed that a continuation of the 5-cent rate with the colonies which

are now exceptions to the general rule will be but temporary.

Mr. Henniker-Heaton, the champion of postage reform in England, points out that every boat belonging to the steamship lines communicating with the British colonies will be "floating British postoffices," and will carry an abundant supply of penny stamps for sale. Moreover, he states that every squadron and every naval vessel in any part of the world will be a "portion of the British postal territory," and everybody serving thus under the British flag will have his letters forwarded by the shortest and swiftest route to its destination for 1 penny.

The day the new rate went into effect the mail that left Canada for England was the largest that ever left the dominion.

RUSSIA  
IS MAKING  
PROGRESS

Russian industry is making rapid progress. Within the last few years cotton mills have sprung up in all parts of the empire. Where at one time Russians were content with English goods, the German gradually crept in with the cheaper article, better adapted to tastes and requirements. Presently their ambition rose above this, and they asked why they should not themselves become producers. Factories were started, English machinery imported, and English foremen and engineers placed in control. Then the English engineer was supplanted by the German, the machinery perhaps got out of order, and the introduction of German machinery, accompanied by American, naturally followed. By this time Russia had started schools for the training of a special class as engineers. They are supplanting American, German, and English in their own country and are beginning to turn out machinery of their own design.

LESSON  
IN PUBLIC  
ECONOMY

The burning of refuse by the Shoreditch parish, of London, to supply electricity for lighting streets, dwellings, and public buildings has aroused considerable discussion in the electrical press. Before the new plant was in operation the parish had to pay about \$30,000 a year for carting the refuse to barges on the Thames and towing it to a dumping place in the sea, and about \$20,000 annually was spent for gas for lighting the streets and parish buildings. Sixty thousand dollars was expended for an electrical plant. The funds were obtained by taxing the people. The plant ran all the time during week days and twelve hours on Sunday, furnishing electric power for small manufacturers during the day and for illuminating purposes at night. The street sweepings have furnished all the fuel necessary, only \$432 being expended for coal. The total expenditures for the first year were \$19,070 for wages, supplies, insurance, repairs, etc. The interest, sinking fund, rents, depreciation, etc., were \$10,205, making a total of \$29,275. The gross receipts for the sale of light and power, including a credit equal to the average charge for street lighting by gas, was \$45,205, thus leaving a net profit of \$15,930. This will be used in enlarging the plant. Of course, by street sweepings must be understood cinders, manufacturing wastes, etc.

An old roller skating rink in Newton, Kan., is about to be reopened as a cycle skating academy.

# To the Trade

**T**HE American Saddle Co. begs to announce that its organization has been completed, and that its general offices are located in the American Trust Building, Cleveland, Ohio.

The American Saddle Co. has acquired the properties and business of the following named companies:

THE GARFORD MFG. CO., Elyria, Ohio  
THE WHEELER SADDLE CO., Detroit, Mich.  
THE WHEELER SADDLE CO., Toronto, Ont.  
THE GILLIAM MFG. CO., Canton, Ohio.  
THE HUNT MFG. CO., Westboro, Mass.  
THE P. & F. MFG. CO., Reading, Pa.  
and a controlling stock interest in the  
BROWN SADDLE CO., Elyria, Ohio.

The primary purpose of the new organization is to arrest the calamitous conditions which have governed the saddle industry for the past two seasons, and which have deprived the makers of fair returns on their capital invested.

This it will strive to accomplish, not by the advancement in price of its product to the trade, but by the reduction of expenses and the cost of manufacture through concentrated management of its business and the employment in its several mills of the best special machinery and mechanical appliances known in the art of saddle building.

It will constantly endeavor to better the grade of its product, and by increased facilities extend better service than has heretofore been possible.

All communications should be addressed to the company at Cleveland, Ohio.

## The American Saddle Company

By A. L. GARFORD, President.

## WAR FOR CHEAPER CARBIDE

### Plans Afoot for Co-operative Action By Makers of Generators—New Processes Proposed

In nearly all minor towns where acetylene lamps and gas generators for house or store lighting are sold, the trade in these new commodities has by natural selection fallen into the hands of bicycle dealers and hardware men, but more or less difficulty is experienced in introducing the goods, partly on account of their novelty, but also partly on account of the restrictions to which the trade is subjected.

Manufacturers of acetylene gas generator machines are split up into two camps, comprising on one side those who expect the smoothest sailing by submitting to the existing order of things and, in opposition, those who dearly love a little warfare for free competition and unrestricted trade. The restrictions complained of have reference to fire insurance regulations which hamper construction of generators and to the production of calcium carbide by a single producer.

#### Will Resist Underwriters' Regulations.

The Western Union of Fire Underwriters, the National Board of Underwriters and various state boards of underwriters form the regulating factor whose rulings make or mar the business of the generator manufacturers, or, more correctly, would do so if individual insurance companies did not see fit to deviate from these rulings at their own option. The underwriters have set up the rule that a generator maker must obtain their approval of his pattern of gas machine before the latter may be placed on premises covered by a policy issued by any of the insurance companies which operate under the board regulations, and they have allowed themselves a liberal fee—\$100—for passing judgment on each gas machine. If this is not paid the machine is tabooed, and its maker finds more or less difficulties in selling it. It is now charged in several quarters that the payment of the fee is of much greater consequence for securing the underwriters' stamp of approval than any consideration of the mechanical construction of the gas machine; and in the objectors' opinion construction should alone determine whether there is created any additional fire risk by its installation in a building. In other words, it is contended that the stamp of approval has been put on machines of inferior construction and that the underwriters have thereby stultified themselves to such an extent that generator makers whose ideas of construction are of a different order, may do better justice to themselves and the public by balking against the rules than by submitting to them. The threatened warfare consists partly in an attempt at organizing as many generator manufacturers as possible in resistance of the rules, so as to either bring about a revision of the same or induce individual insurance companies to disregard them. It is stated that a number of insurance companies are already quietly doing so.

#### To Fight Carbide Combine.

The other side of the rebellion is one of greater general interest and one which promises livelier developments. It is directed against the Union Carbide Company, which at present controls the production of calcium carbide in United States and turns out all the carbide consumed in bicycle lamps, as well as for house, store and town lighting, at its two large plants at Niagara Falls, on both

sides of the boundary, and at Sault Ste. Marie, Mich. The production of this company is conducted under the Wilson patents, which describe the first process for making calcium carbide on a commercial scale by passing a mixture of pulverized coke and burned limestone through an electric furnace. The lowest quotations which have been made for the product is said to have been \$3.75 per 100 lbs. in ton lots, and the usual price has been \$80 per ton.

#### Degeneration Under Monopoly.

At these figures the lowest price which makers of generators could quote for their customers has been five cents per pound and, assuming that each pound will make five cubic feet of gas, this makes acetylene gas cost the consumer ten dollars per thousand feet as against one dollar per thousand feet of coal gas. The illuminating power of acetylene gas being about eleven times that of coal gas, the two means of illumination are therefore at present of equal cost to the consumer. This is bad for the generator makers, who would like to show a great saving by using acetylene, but it is made much worse if the calcium carbide furnished fails to reach that standard of purity at which it produces five cubic feet of gas to the pound of carbide. European makers of carbide produce the highest grade, but the American monopoly, it is alleged, has allowed the quality to degenerate until frequently no more than two and one-half feet of gas can be produced from the material placed on the market.

It is against this alleged condition of affairs that certain makers of acetylene generators have risen in protest.

#### Scheme for Manifold Benefits.

George Harden of Toledo, who is known to the bicycle trade as the patentee of the Harden bevel-gear bicycle with driving gears on both sides of the crank shaft, and who is the manufacturer of an acetylene generator which is marketed independently of the approval of boards of underwriters, has taken up the cudgel in defense of generator makers and is at present engaged in the work of organizing them for the manufacture of calcium carbide on the co-operative plan. He holds the view that it is useless to attempt selling generators so long as no material saving by substituting acetylene for coal gas can be offered the public, and that, on the other hand, calcium carbide can be produced so cheaply as to make the generator business one of the greatest promise and prosperity. He finds no difficulty in interesting other generator makers in his plans, and contends that it is easily within the range of possibilities to make calcium carbide at a producer's price of much below \$10 per ton.

#### Production at \$5 to \$7 Per Ton.

It is stated that a Chicago inventor has offered to sell calcium carbide to generator manufacturers, if a sufficient number are combined to guarantee the purchase of his output, at \$25 per ton instead of \$80 as charged at present, and he makes no concealment of his own expectation of limiting the cost of production to \$5 per ton. The material which he proposes to furnish differs slightly from the carbide now in the market, but is said to give more gas per pound.

A Toledo chemist and electrical engineer has another process by which the

first cost of the calcium carbide is reduced to \$7. These estimates, however, do not include interest on the value of plant, nor administration expenses.

With these inducements in hand the aggressive Toledo manufacturer expects before long to have most of the representatives of the generator industry arrayed in line of battle against the Union Carbide Company, and to enable them all to convince the public of the superiority of acetylene gas over coal gas on the point of economy as well as the quality of illumination.

It is the supposition that any one of several practical processes for fusing coke and lime may be employed by the projected amalgamation without interference with the Wilson patents.

#### NEW BEVEL GEAR DEVICE

Crank Shaft and Main Driving Gear Supported By a Single Row of Balls.

Some time ago a Chicago inventor brought out a chain driven machine in which the usual two rows of balls in the respective ends of the crank hanger were replaced by a single row of balls rolling in four point races placed centrally in the frame and much larger in diameter than the common races of the standard type. Now C. W. Hamilton of Omaha, Neb., has obtained a patent on a bevel gear driving mechanism which employs the same hanger bearing scheme.

The driving gear is secured to the center of the crank shaft and comprises two adjacent plates to the right of which the toothed rim is fastened. The two plates

have each ball races around their peripheries that match corresponding races in the larger narrow hanger bracket, the parts thus together forming a regular four point bearing. That the bearing may be adjusted the plates are not placed tightly against each other, but are separated by a mat of leather or similar material. Cup shaped nuts screwing on the axle at each side of the pair of plates are used for pressing the latter together when it is desired to tighten the bearing. The leather mat through expansion will cause the plates to separate when by the unscrewing of the nuts to loosen the bearing the pressure on the mat is lessened. Lock nuts are provided to retain the cup adjusting nuts in position after the proper bearing adjustment has been made. The construction brings the balls on which the driving gear is supported quite outside of the gear itself and at the same time permits the use of a very narrow incasing box for the gear and pinion.

#### Frame Cushioned on Rubber Balls.

H. E. Henwood of Chicago is the inventor and recent patentee of a cushion frame device in which the flexing action of the springs is supposed to be limited to a vertical movement. The inventor's object is to relieve the machine from strains and injuries caused by cushion parts flexing in several different directions under heavy jolts. His proposition for accomplishing this object is to limit the action of one spring by the retaining influence of another placed in a different plane. The frame is supported on hollow

rubber ball cushions, one of which is placed at each end of both the front and rear axles. The balls are secured between upper and lower attaching plates which fasten respectively to the frame and to the wheel axle ends, thus forming the union between the frame and wheels. Around each ball and in a position parallel to the wheels of the bicycle is a circular spring strip, and at right angles to it but still in a vertical plane is a similar strip. Each ball is thus inclosed in two spring strips which act oppositely on each other and keep the ball cushion from flexing with other than an up and down movement. The spring strip at right angles to the wheel also keeps the rubber cushion from flattening to the extent that its inner side would touch the spokes of the wheel. A pair of brace rods running from the crank hanger to the rear axle ends takes some of the strain off the supports of the rear wheel cushions.

**ENGLISH FOIBLE FOR STRUTS**

**Designers Indulge Desire for Novelty in Frames Without Much Benefit to Anybody.**

The use of diagonal tubes for the strengthening and stiffening of frames has been for some time in great favor among English designers. A noticeable proportion of the tandems now being built in Great Britain have frames in which cross struts are employed in some manner or other, and there are several single machines in which the diagonal tube is the distinctive part of the frame. English riders do not shudder, as we are inclined to do, at tubes crossing each other at all sorts of angles. If he thinks that a tube running between two certain points will strengthen the frame, in goes the tube regardless of appearance.

A recent example of tube crossing, and one which gives a frame that is not

bad looking, is that shown in the accompanying illustration, and which is used on one pattern of the Raleigh bicycle. Instead of the usual single top rail, there are two, one running from the upper end of the steering head to the crank hanger and the other from the seat cluster lug to the lower end of the steering head tube. A connecting lug is used at the crossing point of the two upper rails. While the construction doubtless enables the frame to better resist fore and aft stresses, the bracing has several features which might be improved upon without departing very far from the main idea of the design. The crossing of the two upper tubes demands the breaking of one or both tubes and the interposition of a connecting lug. Accordingly the vibrations of the metal in traveling along either of the tubes can extend in a unit of motion as far from each end only as the crossing point. Here all the vibrations of both tubes will centralize. The frame, then, possesses stiffness which is gained by added material and short reaches of tubes rather than strength obtained through proper strutting.

England still holds the supremacy in China, as well as in Siam. In 1897, 20,000 English ships entered the nineteen treaty ports of China, against 2,140 from Germany and 174 from France.

**GEAR GENERATING MACHINES**

**RAPID OPERATION THE OBJECT**

**Beale's Patented Crown Gear Generator Actuated to Secure Maximum Amount of Abrading Friction.**

A few weeks ago patents were allowed on bevel gear generating devices in which the blanked out gear was finished to accurate form through abrasion caused by the rotation together of the gear blank and a crown gear generator the pitch surfaces of whose teeth were mutilated or serrated to form cutting edges. To the inventor of these devices, Oscar J. Beale of Providence, R. I., there were last week

the main spindle on which the crown generator is mounted has at its rear end, just within the pulley by which it is driven, a sleeve that is secured against rotation with the spindle, but which cannot slide in an axial direction upon it. Depending from the lower side of this sleeve are a pair of lugs which receive the free rear end of a link the forward extremity of which is attached to an eccentric upon the end of a cross shaft driven independently by its own belt and pulley. The revolution of the cross shaft and its eccentric gives the revolving main spindle a limited to and fro motion along its axial line. In this way the desired additional friction between the generating crown gear and the gear blank is obtained. Another feature of the machine is a friction brake attached to the spindle

allowed patents on machines adapted for putting the generating gears into operation. All of the patents are assigned to the Brown & Sharpe Mfg. Co.

**Two Motions Between Teeth Needed.**

As the action of the generator depends upon the friction between the tooth surfaces of the generator and gear blank, and as this friction decreases as the angle between the axes of the gear blank and generator increases, it has been found that when the angle mentioned is extremely large there is not sufficient friction to effect rapid abrading of the gear blank tooth surfaces. This difficulty

of the blank to be generated. The brake is for the purpose of regulating the pressure between the teeth of the generator and of the blank. It comprises a pair of blocks surrounding the gear blank spindle and which by tightening through the medium of screws may be made to retard the motion of the spindle more or less, and thus cause greater or less pressure on the teeth.

**Operation of the Machine.**

In putting the machine into operation the gear blank is secured to its spindle, the head of the gear blank carrier adjusted about its pivot to bring the spin-

could be overcome by changing the form of the generator by making it in the shape of a small pinion, but as such forms of generators are more difficult to make than the crown gear generator, Mr. Beale has deemed it best to retain the crown gear generator and to produce the necessary friction by using the generator in a machine which will move either the generator or the blank, or both, in such manner that the tooth surfaces have a sliding motion in addition to that obtained by the simple rolling of the two together. In the machine patented by Mr. Beale

dle to the proper angle with the generator spindle and the cross feed and longitudinal slide carriages adjusted to bring the generator and the blank into proper mesh. The power is then turned on and the main spindle rotated and reciprocated. The upper illustration herewith shows this machine complete.

**Intermittent Motion Desirable.**

Another idea of this inventor in relation to the successful operating of his generating device is that the abrading action of the generator is more rapid and

the best results are obtained if the direction of rotation of the generator and blank is intermittently changed during the time the two are in mesh with each other. He has accordingly invented and obtained a patent upon another generating machine in which this intermittent motion is automatically and regularly obtained. This machine is shown in the lower illustration. The generator spindle is driven from a shaft placed lower down in the body of the machine, the connection between the two being through a spur pinion and gear. This lower driving shaft is rotated in one direction by an open belt running over its pulley and in the opposite direction by a crossed belt running over a second pulley adjacent to the first but separated from it by an interposed loose pulley which acts as loose pulley for both belts according to which is at any moment driving the shaft. A belt shifter is placed between the two belts and is arranged so that when it throws one belt off its tight pulley and onto the loose pulley it throws the other from the loose pulley and onto its tight pulley. The shifter is operated by a cam engaging its lower end and driven by a cross shaft rotated by an independent belt. Thus the direction of rotation of the spindle is intermittently reversed, the number of revolutions it makes in one direction before being reversed depending upon the relative speeds of the cam and shaft which drives the spindle.

#### German Taper Gauge Tubing.

Taper gauge tubing and tubular parts manufactured by the German Arms and Ammunition Works of Karlsruhe, Germany, are being introduced in the English market and are mentioned as especially attractive in finish and design.

THE CYCLE AGE

Among the pieces in which the gradual taper gauge principle is embodied is a single piece fork and crown of the design shown in Fig 1. It is stated that the crown is drawn as shown with a flashed lug ready to be brazed to the fork stem. Fig. 2 represents a brazeless handlebar teepee of the same manufacture. The whole line is being recommended especially for assemblers on the ground that taper gauge tubing renders reinforcements unnecessary and thereby, besides saving work, removes the danger of burning the steel by repeated brazings.

#### Defective Machines in Australia.

Many serious accidents on road and track have occurred in Australia during the past year or two to riders of a certain much boomed English machine of inferior quality. The last of these happened at the East Melbourne race meet, January 9, when J. Farrell fell on the track and was almost killed. The forks had snapped like a carrot and the rider was thrown on

his head. He is still in the hospital lingering between life and death. When the fall occurred the officials of the meet took charge of the machine, placing it in the center of the arena. The agents, noticing this, sent an employe to take the machine away. When the officials missed it later they traced it, and now have it under lock and key awaiting the result of Farrell's injuries. There were no reinforcements whatever in the forks, and in case of Farrell's death an effort will be made to hold the agents responsible.

#### PROFIT IN CASH DISCOUNT

Frequent Turning Over of Capital Gives Seller Larger Returns and Buyer Lower Prices.

An organized effort is being made to impress upon retailers the very considerable profit there is in paying cash for purchases, or paying at such times as will secure to them the cash discount. It is justly contended that the cash plan is really the only way to do business with any prospect of success in this competitive age of small profits and quick returns. Considered from any standpoint, it is the only rational system. Reason, common sense and self-interest alike are opposed to the superannuated system of long credits which are hurtful alike to retailer and wholesaler, and a brake on business progress.

A very convincing letter in relation to this matter was sent by a wholesaler to his customers at the first of the year. He says:

The better you keep me paid, the better I can buy and sell you goods. Always remember that the man who sells you goods on long time makes you foot the bill not only for the use of his money but also for bad debts. We want to be all the help we can to customers, but we do not have a dollar to loan, and goods are dollars.

Let us show you how it works: I pay \$1 for goods, sell in thirty days for cash at \$1.10, take the same \$1 and buy again. If I can do this ten times in one year, I have made \$1 clear. I sell the same goods to you for \$1.30 on six months' time; I turn my \$1 only two times and make only 60 cents, and you have paid me three times as much profit. Can you see the difference?

The difference is quite large enough to be visible to any business man. The country is in an unusually prosperous condition at present, and never was there a more opportune time to adopt the plan of cash payments which is yearly becoming more of a business necessity. In this age of evolved systematization, business-doing is becoming more and more an exact science, from which the element of risk is being slowly but surely eliminated. Hence this campaign of education in regard to the profit in the cash discount.

#### Liability of Bicycle Makers.

To the Editor:—Your editorial in the last issue about the liability of manufacturers is O. K. It is the greatest wonder in the world they get off so easy. All that protects them is the distance which separates them from maimed customers, which distance effectually prevents suit.

Some years ago I sold about 250 bicycles here, and over one-half of them broke down. Scarcely a day passed but a customer would break a crank axle and go over the handlebars at the same time. Broken forks and frames time and again led to severe accidents among my customers, sometimes right in front of my store. You can imagine how from a series of disasters like this the reputation of a dealer suffers. It is hundreds of dollars out of his pocket, and his judgment in the selection of stock is ever afterwards questioned. For my part, I say it is a pity that some of the makers have not been sued.

Not long ago I myself was riding a 20-pound racing machine, when it collapsed, and I was thrown forward with such force

as to break my jaw. I wrote the firm who made the machine, asking them at least to pay my doctor's bill, but this was refused. I was riding on a macadamized road and at least six people saw the machine collapse. In this case both bars broke square off at the head.

In the many articles appearing in the Cycle Age on the subject of extortionate express charges I observe that the eastern dealers have no kick coming. The other day I got a machine from New England, the express charges on which to Chicago were \$1. The express charges from Chicago to this point, however, were \$3. Nice, isn't it? L. C. WAHL.

Colorado Springs, Col.

#### METAL WOOL MAKING!

Machine for Shaving Thin Filaments From the End of a Roll of Sheet Metal.

Since wood has entered into the construction of bicycles through the introduction of wood rims, guards and saddle bases the makers of these cycle parts have been to some extent interested in and purchasers of metal wool which they use for polishing purposes. Sigmund Feust, of New York city, was granted on February 7, patent number 619,076, the subject of his invention being a machine for manufacturing metal wool from sheet

metal in the roll. The machine, which is here illustrated, comprises in the main means for supporting the roll of sheet metal in such a manner that the broad flat cutting tool will engage the end of the roll and cut therefrom thin filaments of metal. In the construction specified by the inventor the roll is rotated on a shaft placed longitudinally in the machine, and the cutting tool is mounted in a slide carrier to be moved toward the end of the roll and thus keep the tool in constant cutting relation to the rolled metal. The tool is adjustable in the carrier so that it may be made to engage different portions of the end of the roll and also so that it may be moved to and from the roll when it is desired to vary the depth of the cut. The roll rotates in the direction in which it is wound, and to prevent any tendency to unwind a pair of horizontal rollers mounted on arms pressed together by coil springs roll on the surface of the roll above and below the spindle. The slide carrier is fed along the bed automatically by a weight which keeps it at all times in the proper relation to the roll, the weight pulling the slide along in correspondence with the rate at which the cutting tool shaves off the metal from the end of the roll.

J. E. Mulholland, president of the International Union of Bicycle Workers and Allied Mechanics, has presented a resolution to the common council of Toledo for the passage of an ordinance creating an eight-hour working day in that city. The resolution was approved by the mayor and unanimously passed by the council.

## MOTOR TRICYCLES IN U. S.

### Builder of Motor Carriages Expresses Conviction That Uncovered Tricycles Have Been Found Wanting

In view of the extensive sales which have been made in Europe of motor tricycles and other motor vehicles in the construction of which no attempt is made to shelter the occupant from weather and the driving mechanism from the dirt of the road, the prospects of selling this class of vehicles in United States have been widely discussed of late, and the opinion has seemed to prevail that the comparatively low price at which such vehicles might be sold—from \$500 down to \$250 apiece—would probably open a considerable market for them among that large class of people who are neither rich nor poor and who, having passed the age at which the inclination for athletics is dominating, yet preserve their sympathy with all forms of outdoor exercise in which profuse perspiration is not an indispensable feature.

#### Substitute for High Priced Bicycles.

The motor tricycle especially seems to offer this class at once recreation and utility at a comparatively low cost, and bicycle makers as well as bicycle dealers have evidently in many cases accepted the conclusion that it might be made to fill that void in their sales which the extinction of high-priced bicycles has created. Under these circumstances the dissenting voice of one who has given the subject of tricycles in general much practical attention will be listened to with interest, and the following letter from Charles E. Duryea of Peoria, Ill., expressing the opinion of one who is not only unusually conversant with the past history of tricycles in United States but actively engaged in motor vehicle manufacture, will therefore have its weight in the general deliberation. He writes:

To the Editor.—To your inquiry of February 3, the writer submits his opinions, as follows: The early cycle enthusiasts in this country took up the tricycle as being a safe and satisfactory machine, but found it too heavy for our bad roads, too narrow gauge for our rough roads, too unprotected for our muddy roads, and generally unsatisfactory. This experience does not prove that the motor tricycle will fare likewise, but it is a very strong pointer that way. The motor tricycle abroad has been the lightest machine available, and therefore has had a very large sale. Their roads are much smoother and cleaner, so that the machine is fairly comfortable and practical. Further, they are not so mechanically esthetic as our Americans, and will accept a much clumsier and cruder mechanical device than can be sold here.

#### Cumbersome in Emergencies.

The writer bought one of the popular De Dion motor tricycles some time back and used it in his daily goings for a while. It was generally reliable and was not found objectionable on that score, but it had many faults that rendered it less satisfactory than the ordinary bicycle. It was too heavy to handle up and down stairs or in and out through doors comfortably. It could not be led over bad stretches or up hills without over-exertion. A rough bit of road gave so much sidewise vibration that one needed a spinal column laterally hinged. Following a sprinkling cart for half a block would deluge it with mud so completely that an hour or more was required to clean it. It was not an easy thing to mount or dismount from, and required as much attention to the motor, batteries and other parts as a full-fledged motor carriage. On good roads the motor would do all the work, but on hills it was very likely to shirk and leave the rider to do it all.

Putting these facts in connection with the experience of the tricycle before mentioned, indicates that the motor tricycle has no market in this country. This is borne out by statements of the concern which has been manufacturing and offering for sale such a machine. They say that the Ameri-

can public does not take to this type of carriage. So much from the practical and experimental standpoint.

Theoretically, the tricycle has no future. If three wheels are to be used, the American public will insist upon a light buggy body mounted thereon, and a comfortable carriage appearance. This, too, will be easily supplied, will bring a better price, and will give far better satisfaction. Small, light buggies are therefore quite possible, and, judging from our inquiries, will be quite saleable. We have designs for such a vehicle already prepared and are at work building same now. We expect to market some of these within a very few months and give our theories a trial.

#### As a Pacemaker.

As a pacemaker, the tricycle has a number of objections. It cannot run as close to the curb as the ordinary cycle and, therefore, will not properly shield the rider following. It is not so fast a machine as the two-wheeled and is more likely to upset in turning corners. We believe the pacemaker of this country will be a tandem bicycle equipped with large power motor, having one man to steer and the other to manage the motor and control the speed in accordance with the instructions of the rider being paced. Such a machine would go anywhere that a bicycle could go and can easily be built to have a speed of one mile per minute, or more if desired.

A prominent ex-racing man and mechanical expert has been corresponding with us along this line, and we have advised such a machine for this purpose. We are very busy with our present work, but intend to put something in the line of a motor bicycle on the market before many months. We believe the motor two-wheeler will meet young America's ideas better than any other machine. It will be cheaper, lighter and faster. It will be able to go practically anywhere that the bicycle now goes, and this is very essential in a country where so many bad roads exist, but where a single path can usually be found.

#### Plenty of Exercise With Motors.

The argument that the motor bicycle deprives a rider of needed exercise is all bosh. A motor vehicle of any kind offers plenty of opportunities for excitement, exercise, life, or any other amusement possible with the bicycle. The motor cyclist can assist his motor on the hills or assist it when great speed is required, and if covering a mile a minute over country road does not give him all the exercise desired, he can practice walking back and lugging the machine. But leaving jokes aside, there are a large number of former cycle riders who are not anxious to see how fast they can push a machine with their own muscles, and to them the motor vehicle will appeal strongly. They can assist as much as desired to get proper exercise, and need not take more exercise than they feel inclined to, in order to keep up with the ordinary crowd. Many of them are men who labor for a living physically and do not need exercise. To them the cycle will save time and give recreation with rest.

There is no doubt that this form of vehicle will rapidly crowd its way into the ranks formerly occupied by the high-priced bicycle.

#### No Permit Needed for Motor Buses.

Washington, D. C., Feb. 13.—The attorney for the District has rendered an opinion on the question of permitting motor cars and carriages to use the streets of this city. The attorney held that if the power to be used in propelling the motor vehicles is dangerous in itself, it would be the duty of the commissioners to prohibit their use. If, however, no danger need be feared, they may be used without a special permit.

#### Racing Board for Automobiles.

Speed contests between motor bicycles, tricycles and road quadricycles are becoming so numerous in France and attracting so much interest that the French sporting papers are urging the Automobile Club of France to form a committee

of its members, with functions similar to the racing board of the L. A. W., to officially recognize all records made under certain rules to be laid down. It is proposed to have a certain number of timers to replace the timers of the U. V. F. Automobilmism is making such rapid progress and motor vehicle races are becoming so frequent that a step of this kind is very important, and it is believed that an official racing and records committee will be formed very soon, and it is predicted that before long an international motor vehicle racing league will be organized.

The suggestion of the sporting papers has been favorably received by the Automobile Club, and such a committee, consisting of twelve members has been appointed to have entire charge of motorcycle racing and records. The timers to be selected by the racing commission will be paid according to a schedule fixed by the commission.

#### THIRTY MILES AN HOUR

##### French Petroleum Motor Vehicle Makes Locomotive Speed in 132-Mile Road Contest.

Four motor vehicles started in the Perigard challenge road race run January 26, from Paris to Rouen and back, a total distance of 132½ miles. The four competitors were Girardot, Mors, Charron and Lefeare, and with them also started two others, who, however, were not qualified competitors for the prize. All of the vehicles started out smoothly and rapidly, with the exception of that of Girardot, whose burners had gone out, and thus caused a delay of four minutes. Girardot made up this lost time, however, on the way to Rouen, and was the first to reach the turning point, covering the distance in 2 hours and 18 minutes. His return trip was not delayed and he finished first in 4 hours and 26 minutes for the entire distance, making his average speed nearly thirty miles per hour. The total time lost by Girardot during the race on account of necessary stops was about twenty minutes.

Charron finished second, one-half hour after Girardot. He came in with the tire of the left rear wheel punctured, having ridden several miles on the rim. Mars and Lefeare were compelled to give up early in the race on account of accidents, and the two unqualified starters were also compelled to quit after going but a short distance.

The winner's time is said to be record for the distance. His machine was a Panhard & Levassor petroleum vehicle, weighing 1,600 pounds. It is driven by an 8 horse-power, four-cylinder motor. The same machine finished sixth in the Paris-Amsterdam road race.

#### LEITER PROJECT LOOKS DARK

##### Nothing Done By Compressed Air Truck Companies Since Incorporation—Engineers' Views.

Recent events point to the belief that the Leiter compressed-air power enterprise, which was started two weeks ago, will never materialize. The truth is that the trustees of the bondholders of the Rhode Island locomotive works have little or no faith in the deal. Since the organization of the syndicate nothing has been done, save that the syndicate people have sent several communications to the trustees asking for modifications of the terms of the contract on which the purchase was to be based. The latest of these overtures was flatly and emphatically rejected. Subsequently it was ascertained that some of the trustees considered that the deal was practically off.

The attitude of most engineers toward the proposal of the auto-truck companies to use compressed air for motors

for omnibuses is one of languid interest only, tinged with faint hope but great doubts. It appears to them that the first thing needed by an "auto-truck" corporation would be a successful "auto-truck," and that if such a machine were found it might make a basis for raising capital. The compressed air promoter, however, does not see things with the narrow view of the engineer. He is an expansionist, and not a conservative. He knows that in order to do anything with compressed air one must "raise the wind." The air must be compressed, but the air company's stock must be inflated and floated. There are companies galore and lots of stock to be put on the market. It may be many years before New York is beautified by the removal of the horse and the substitution of the auto-truck, but it will be only a few months, probably, before the people will own the stock of the company.

**Motor Vehicles for Buffalo Parks.**

Buffalo, Feb. 13.—At a recent meeting of the board of park commissioners the matter of granting a franchise for the operation of a line of motor carriages in the park system was favorably considered. The National Transit Company, whose motive power is gasoline, put in a bid for the exclusive right to operate its motor buses. Similar bids were received from others. The board deferred action in order to permit investigation of the merits of the different motor systems.

During the meeting a practicing physician, who is the owner of a motor carriage, gave the board the benefit of his experience. The doctor stated that he had used his carriage a little over a year and that during that time he had traveled 4,972 miles at a total cost of \$70.62. He stated that in his opinion motor vehicles were a success and that the board could not do better than to adopt them.

**INVITE AMERICAN COMPETITION**

**MOTOR FREIGHT VANS WANTED**

**English Association to Arrange Open Contest Between Makers of Motor Trucks in September.**

Ever since 1895 the Self-Propelled Traffic Association of Liverpool, England, has busied its members with the problems of self-propelled freight road wagons and similar vehicles for city freighting. The association considers this branch of automobilism as by far the more important from an economical standpoint and involving more mechanical and engineering difficulties than the application of motor power to light carriages and pleasure vehicles.

The high railway freight rates for short hauls and generally unsatisfactory freight service of the railways in England make it appear very desirable to English business men to establish competition with the railways through a motor freight road wagon system, if possible, and this is especially the case in all of that territory adjacent to Liverpool in which manufacturing establishments depend upon raw material shipped from that city.

It is the opinion of American Consul James Boyle, at Liverpool, that there will be a large and profitable market for American freight vans if our constructors succeed in devising a practicable pattern for this class of vehicles in advance of the English engineers who are engaged in solving the problem.

**Limitations for Construction.**

The development of auto-motor freight wagons has been much retarded in England in the past by the law. Formerly, all motor wagons were classed as "traction engines," which meant that, under

the law, they could only travel on a highway at the rate of two miles an hour, with a man walking in front carrying a red flag; and almost every county and municipal authority had obstructive regulations. In 1896, however, a law was passed under which the tare limit of a single motor wagon for use on the highways is three tons, exclusive of fuel, water, or accumulators. It is allowed to have one "trailer," and in that case the tare limit is four tons. The speed limit is eight miles per hour for a wagon of two tons tare or under, five miles per hour for a wagon of between two and three tons tare, and in the latter case when the wagon has a "trailer," a speed limit of six miles per hour is allowed. The maximum width allowed for a vehicle is 6 feet 6 inches. The minimum width of tires is 2½ inches for wagons of fifteen hundredweight to one ton tare, 3 inches for wagons between one and two tons tare, and 4 inches for wagons above two tons. It should be remembered that an English ton is 2,240 pounds. Other important requirements of the law are that auto-motor freight wagons must be so constructed as to be capable of being moved backwards by mechanical application and must have two independent brakes, and the motor must not emit any visible vapor except from temporary or accidental cause.

It was the Liverpool Self-Propelled Traffic Association under whose auspices the contests between motor freight wagons took place in May, 1898, which were described at length in this paper. The conditions of the contest were severe in regard to the condition and gradients of the roads and the vehicles which took part were all powered by steam.

The awards in this contest were made last summer, but the official report of the judges, who were all expert mechanical engineers, was formally presented only a short time ago. In this report nothing

**LEAGUEKIT**

mends any single tube tire. Quick and sure cement repair for small punctures, quick and sure plug repair for large ones. Only tool that does the work of two kits at price of one. Write for prices.

**A MOWING MACHINE...**

costs more than a scythe—but it cuts more hay.

A fine tire costs more than a cheap—but it rides faster and farther. What made the solid tire give way to the cushion—the cushion to the pneumatic? For precisely the same reason the slow pneumatic is bound to give way to the fast.

Nobody wants slow tires; nobody buys them knowingly. And it isn't good, sound business to let people do it unknowingly. If you don't tell them, somebody else will, and they get the impression that they've been cheated.

League Tires need no explanation. Nothing goes into them but the finest rubber and fabric; nothing comes out but speed and staying qualities. "Get there and get back" tires look well in the store, ride well out of the store and, present or absent, are working steadily in somebody's interest—yours, if you handle them.

is said in regard to the motor power, but it has been learned that it is the opinion of the judges—and this opinion is shared generally in England—that, as at present developed, internal combustion, oil, and electric motors are of little practical value for heavy hauling, and that steam, at least for the present, is the only power capable of meeting the requirements.

#### Judges Favor Steam.

Among the conclusions presented by the judges, those of greatest importance to American constructors are probably the following:

The form of wheels and tires adopted by all the manufacturers, though probably perfectly efficient as carriers, were all structurally more or less inefficient as drivers.

None of the vehicles were able to maneuver into and out of an embayment as effectively and rapidly as may be expected when time and experience have effected improvements in design, but they were capable of going anywhere that horse-drawn vehicles are ordinarily required to go.

The general control—stopping, starting, and steering—of the vehicles, when working on the road and amongst traffic was at least as good as with the best types of horse-drawn vehicles.

The hill-climbing powers of the vehicles were much superior to those of horse-drawn vehicles, when commercial efficiency is considered.

At least two speed gears, or an equivalent reserve of power, are essential to successful working on common roads with steep or even with average gradients.

Generally, too much attention was required by the various operations of regulating and driving the vehicles, and, in order that self-propelled vehicles may command a wider adoption than can yet be confidently recommended, there must be an extended use of automatic arrangements analogous to those in other fields of mechanical science. When such improvements are made, they will have a great effect in placing motor vehicles upon a more practical basis for traffic in cities, by enabling comparatively unskilled attendants to undertake their management.

The imperfections of common roads are the principal causes of the heavy maintenance and depreciation charges, and of the element of uncertainty which at present attaches to any service of motor vehicles. On good macadam roads, with moderate gradients, the vehicles to which prizes were awarded would do good service with the respective loads carried during the trials, but none of them could be relied upon for a regular service on roads such as those of the routes selected for the competition.

#### Good Carriers—Bad Drivers.

It is asserted that since the trials the shortcomings arising from poorly constructed wheels—which were from all sides admitted to be the most serious and those that caused most breakdowns—have been remedied by English constructors of freight vans, and that no troubles from this cause are to be expected at the next series of travels, which will be held some time during this year, probably in September. This new contest will be managed by the same association, and it has been officially ascertained that American competition for this contest will be welcomed.

The secretary of the association, through whom the rules of the competition may be obtained, is E. Shrapnell Smith, Royal Institution, Colquitt street, Liverpool.

Indianapolis, which controls between 65 and 70 per cent. of the bicycle chain output of the United States, made more than 650,000 chains last year, many of which went to Europe. The present production is 60 per cent. larger than at this time last year.

A large number of German cycle makers are now turning their attention to the manufacture of motor tricycles and light motor cars, also sets of parts and fittings for same.

Motor cars in France are to be registered by the war department in order to be available for use in time of war.

## U. S. MOTOR VEHICLE PATENTS

### TWO HARD PROBLEMS TACKLED

#### Wagon Body Yieldingly Supported By Chains—Lengthwise Shaft Driving All Four Wheels.

C. T. Hildebrandt and F. R. McMullin, of Chicago; patent No. 613,272. November 1, 1898. Motor-driven vehicle.

The object has been to devise a construction which will permit either or both the front and rear axles to be connected with the driving motor while yet allowing perfect steering as well as oscillation of the stub axles of the front wheels in a vertical plane. To attain this object the driving motor is supported on the running gear and bevel gear pinions are employed to transmit power to and from a shaft that extends lengthwise under the vehicle. The front wheels are mounted upon stub axles, so supported that both wheels may be turned simultaneously by a steering mechanism while the inner ends of the stub axles are connected by universal joints to the outer ends of the

C. T. HILDEBRANDT & F. R. McMULLIN.

main front axle. Power may thus be transmitted to the front wheels to cause them to rotate even while the steering mechanism is being operated. The customary compensating gears are employed. Either electric or gas engine power may be employed with this construction, say the inventors.

#### Designed to Make Riding Easy.

George J. Altham, Swansea, Mass.; patent No. 614,781. November 22, 1898. Running gear.

The object of the invention is to provide an arrangement whereby the body of

G J ALTHAM

the vehicle may be supported flexibly and the axle may have a yielding movement in a plane transverse to the wagon body.

The illustration represents a vertical section of the front wheel axle, only one-half being shown. The axle is tubular

and the two brackets supporting the wagon body are hung upon the ends of a flexible chain which passes through the axle, as shown, and over roller studs fixed in it. Obviously swaying of the wagon body will cause the chain to move over the rollers. When this arrangement is applied to the rear wheel axle, the vertical pivoting of the wheels which is shown in the illustration and which serves for steering purposes, is omitted, but nothing is indicated by the inventor to show how his device may be made compatible with a positive and rigid driving gear connection between the motive power in the wagon body and the drive wheel axle. The invention can therefore only be intended for electric wagons and in no way solves the problem of producing easy, joltless riding in steam or gas engine driven vehicles.

### GASOLINE AS A POWER SOURCE

As Fuel it is Odorless While in Explosive Mixture Its Combustion is Imperfect.

Whether gasoline for motor vehicle propulsion is more advantageously used as a fuel for generating steam or on the

principle of the explosion gas engine, is one of the questions to which the recent successful steam engine vehicles of New England have imparted renewed interest for prospective purchasers of motor vehicles.

In the broad view the advantages of using the gasoline as fuel are most conspicuous.

The combustion of the fuel is continuous with steam, and one great trouble with the explosion engine is that the fire must be lighted and extinguished many times each minute the engine is in action.

With continuous combustion the gasoline can be so perfectly burned as to leave no odor whatever behind it. A pair of double acting steam engines gives a practically uniform propelling effect, and the steam engines and boiler weigh no more than the explosion engine and its fly-wheel. In the Whitney steam vehicle the boiler, empty, weighs 85 pounds, and the engines weigh 19 pounds.

The steam engine reverses perfectly, while the explosion engine does not reverse at all. With steam, almost all of the difficulties in propelling wagons with gasoline disappear, and the steam wagons leave no odor behind, and show no more waste steam than do the water-jacketed explosion engines. The steam wagons, however, use much more water than the explosion engines of equal power, which is a demerit.

A good ladies' bicycle is an important feature in any dealer's line.

A bicycle which is attractive to that most critical buyer is a winner.

There are many of them who want the best they can buy, but the lines, finish and general appearance must be perfect. The seat and handle bar must be just the right distance apart. The machine must be easy to mount, the pedal must be dainty and without projections to catch the dress and above all the finish must be superb.

We have considered all these points and in the Model 26 National, you will find

**National Cycle Mfg. Co.**

Bay City, Mich.

Have you ever thought how few bad accounts you make on Lady's Wheels?

# Plain Talks on **ANDRAE** Cycles

VIII—Light Roadster for Men, \$50.

This is the most handsome bicycle built.

Its taking points have been turned into selling points.

There's more money in selling than there is in talking. We needn't argue that with agents.

The Andrae improved pattern frame, Andrae rigidity, quality, bearings sell the bicycle without talk.

The Andrae hub, with sprocket-like flange for direct spokes is another selling point.

This light roadster is to be shown to the "elite" of your city. There is no reason why a man should not buy an Andrae after he sees it.

There are 14 models in the Andrae line. Every one a seller on sight. Write for trade prices and our monthly paper, "The Andrae Agent."

# THE PASTIME AND SPORT

## PIERCE LEADS COAST GRINDERS

San Francisco Six-Day Race Began Monday—New Records Made—The Preliminary Events.

San Francisco, Feb. 13.—The international six-day race under the auspices of the American Cycle Racing Association started to-night at 10:35 at Mechanics' pavilion. There were eighteen starters, all of whom were in excellent condition after the month of training on the roads of Golden Gate park and between this city and surrounding towns.

The track is eight laps to the mile and banked eight feet in sixteen. It is said by Miller, Waller, Michael, Elkes, Bald and other champions to be the fastest ever built indoors, and the only fault found with it by the six-day men is that it is rather steep for the finishing hours of the long grind.

The contest is to continue for the full 144 hours instead of 142, and it is the opinion among the men that 2,250 miles will be ridden during the week by the leaders. Several of the riders expect to remain on their machines continuously during the first twenty-four hours, or until they gain the lead. The battle therefore promises to be hard fought.

Following is a full list of starters: Charles W. Miller, Frank Waller, W. B. Pierce, Frank Alberts, Louis Gimm, John Lawson, J. W. Nawn, Oscar Aaronson, Teddy Hale, Ed Stevens, Oscar Julius, Fredericks, Charles Turville, C. W. Ashinger, John Chapman, Tom Barnaby, Henry Pilkington and George Hannant.

### Stevens Defeats Eaton.

The event of the evening in the preliminary sprint races was a one-mile match race between Orlando Stevens and Jay Eaton, paced for six laps by Fournier on his motorcycle. Stevens won the first heat in 2:04 1-5, and the second heat and the match in 1:59 3-5.

The first semi-final of the professional tandem pursuit race resulted in the making of a new indoor record, Cotter and Downing defeating Lawson and Julius in 1:59 4-5. The final resulted in a victory for Cotter and Downing over Stevens and Goodman in 1:59 4-5. Summaries:

Half-mile handicap—Lawson, 30 yards, first; Cotter, 55 yards, second; Chapman, 20 yards, third. Time, :59.

Half-mile unpaced, exhibition, by Charles W. Miller. Time, :59 2-5, indoor record.

One-mile, exhibition, paced—Harry Gibson. Time, 1:58 3-5.

Half-mile, exhibition, paced—Eddie Bald. Time, 1:00 3-5.

Two-mile exhibition, paced—Harry Elkes. Time, 4:01 2-5.

One-mile motorcycle exhibition—Fournier. Time, 1:58 4-5.

One-mile exhibition, paced—Jimmy Michael. Time, 1:57 1-5.

Racing began in the pavilion last Saturday night. A mile professional tandem handicap was won from scratch by McFarland and Stevens in the record time of 1:59 from scratch, passing the limit men twenty feet from the tape. Harry Elkes, paced by two tandems, rode an exhibition mile in 1:54, breaking all previous indoor records.

### Pierce and Ashinger Leading.

San Francisco, Feb. 14.—Waller and Chapman have been forced to quit the six-day race because of trouble with their eyes. Physicians told Waller that if he continued it might result in permanent blindness. He stopped, sadly dispirited, after riding 334 miles without dismounting. Turville has suffered with cramps since the start and had to quit at noon today after going 263 miles.

From the field of a dozen in the contest who had not dismounted up to the noon hour today there was a slow cutting down one by one until at the nineteenth hour Pierce and Ashinger came out alone into the true contest of endurance, both prepared to fight it out to a bitter finish.

Stevens had a fall and lost ten miles as a consequence of locking handlebars with another contestant, but is now one of the freshest men in the race. Gimm did not dismount until 4:59 this morning and is feeling well and confident.

The score at the end of the twenty-second hour was:

	M.	L.
Pierce . . . . .	428	..
Ashinger . . . . .	427	4
Miller . . . . .	425	1
Gimm . . . . .	423	4
Lawson . . . . .	423	2
Hale . . . . .	419	2
Barnaby . . . . .	419	..
Nawn . . . . .	418	1
Aaronson . . . . .	416	3
Stevens . . . . .	415	3
Albert . . . . .	413	3
Fredericks . . . . .	412	1
Julius . . . . .	406	..
Pilkington . . . . .	379	1
Hannant . . . . .	372	6

The previous world's indoor record for twenty-two hours is 419 miles 4.76 feet, made by Pierce in New York last December. Ashinger is the only rider who has not dismounted up to date.

### Appeal to the Cyclists' Syndicate.

At the meeting of the Cyclists' Syndicate of Northern France, held January 26 in Paris, a letter from the French riders who were disqualified by the L. A. W. and fined by the U. V. F. for participating in the last six-day race in New York city was read. The riders wanted to know what would be their reception if they returned to race in France, and if they could ride under the protection of the Cyclists' Syndicate. Edouard Taylor asked the syndicate to use its influence to get the fine of \$200 imposed upon him by the L. A. W. lifted. The members present at the meeting made no definite statements as to the course which would be pursued by the French riders' syndicate, being willing to let matters rest until the riding season opens. Sympathy was expressed for the outlaw riders in America.

### Circuit During World's Meet Time.

The committee in charge of the National Meet in Boston is conferring with the World's Meet committee at Montreal with view to arranging a circuit of several weeks' duration and embracing such eastern cycling centers as Boston, Providence, Springfield and Montreal. The meets during the circuit as proposed are to be held at times which will make it convenient for riders coming over from Europe to attend the international meet to stay and compete in the circuit races. In this way it is thought a larger number of foreign riders can be induced to come to the I. C. A. meet.

### Brady Plans Co-operative Team.

W. A. Brady is planning to form a racing team of fifteen or twenty riders whom he will retain for the season and guarantee each a certain amount for the season's work and expenses, with a share in the winnings, which may or may not amount to more than the guarantee. The team would follow the large circuits and be entered in all open events and in case of a dearth of meets Brady would run races of his own which would be open, riders not members of his team being invited to compete.

## L. A. W. NATIONAL ASSEMBLY

Delegates at Providence Elect Keenan President and Decide to Continue Control of Racing.

T. J. Keenan of Pittsburg elected president. H. W. Foltz of Indianapolis, first vice-president.

R. W. Kingsbury of Keene, N. H., second vice-president.

J. W. Tattersall of New Jersey, treasurer.

Jacksonville, Fla., selected for next National Assembly.

Control of racing retained by the League.

Professionals denied admission to membership.

Professionals allowed one representative in the assembly.

All amateurs required to register in the L. A. W.

Providence, Feb. 13.—The above summary shows the most important acts of the state division delegates of the L. A. W. assembled here in national convention last week, and the very liberal concessions made to the dissatisfied professional racing interests to appease their discontent and effect a compromise which shall bring the "outlaws" once again willingly under jurisdiction of the League. These concessions amount in toto to granting the racing men representation to the extent of one delegate to the National Assembly, whose feeble voice cannot be heard for at least another year.

### Will Not Conciliate Racing Men.

The white-haired fathers of the League again showed their disapproval of the professional racing men by denying them admittance to membership, but they are sufficiently interested in the sport to want to control all the racing in the country. That they have adopted a course conducive to that end will be doubted by most persons at all interested, as it will appear that the granting of one absolutely powerless representative to the annual convention is more in the nature of a direct affront than an earnest desire to treat with the racing contingent honestly.

### Road Improvement Discussed.

The assembly opened on Wednesday with 100 delegates and members present, and as many more scattered snowbound over the railroads of New England. The convention having been called to order by President I. B. Potter, the day was devoted to the discussion of the improvement of the highways of the country, with G. W. Parsons, of the national good roads committee, presiding. President Potter spoke of the benefits of cycle paths. E. G. Harrison reviewed the work the Department of Agriculture is doing for the cause. F. O. Stanley gave an address on the motor vehicle and its relation to good roads.

### Welcome By Governor and Mayor.

At the afternoon session a hearty welcome was extended to the delegates by Governor Dyer of Rhode Island and Mayor Baker of Providence. Dr. Mendenhall spoke on road building, contending that the improvement of roads generally was first agitated by the wheelmen, and citing Massachusetts as a pioneer state in wagon road improvement whose good road laws are a model for other states. Sterling Elliott spoke briefly. Conway Sams discussed the co-operative agitation between wheelmen and horsemen, who have drawn closer together during the past few years. The afternoon closed

# Mr. Dealer

Hundreds may apply for that vacancy in your store, but with **Intelligent Discrimination** you select the man whom, after careful investigation, you ascertain to possess those **Sterling Qualities** which will make him a **Valuable Adjunct to Your Business**. As Dealers, alive to the importance of securing the most **Intelligent Line of Cycles** built to-day, we ask that you cheerfully **Inspect Our Product** and **Investigate Our Record**, which represents the most remarkable stride into popular favor ever known. **Why?** Apply for our agency. The **ORIENT** on your floor will open up **Possibilities for Business** beyond your most sanguine hopes. Send for our catalogue. Write for territory. Our agents are already beginning to **Reap the Results** of our past work, and they easily **Hold Their Own**.

ST. LOUIS OFFICE:  
621 Holland Bldg.

with a short talk on the roads of Europe and America, illustrated by lantern slides.

#### Election of Officers.

Thursday was devoted to the election of officers, the discussion of racing matters, and the presentation of officers' reports. W. J. Van Valkenburg of Milwaukee nominated Keenan for president, and was seconded by Chief Consuls Boyle of Pennsylvania, Kireker of New Jersey and Elliott of Massachusetts. Keenan was then elected unanimously and made a short speech thanking the delegates for the honor.

Herbert W. Foltz was nominated for first vice-president by Conway Sams of Baltimore, and seconded by Sterling Elliott. The secretary was directed to cast the vote of the assembly for Foltz.

Robert T. Kingsbury was nominated for second vice-president by President Potter, and instead of opposing the nomination as was expected both Chief Consuls Cooke of Rhode Island and Locke of Illinois seconded the nomination and a unanimous vote was cast. James W. Tattersall of New Jersey was unanimously re-elected treasurer.

#### Auditor Criticizes Racing Board Statement.

George G. Greenburg criticised the laxity of the racing board in failing to attach vouchers to its report showing how the receipts from registration and sanction fees have been expended, and presented an amendment proposing an auditing committee. This was adopted, and the following committee elected: Howard L. Perkins of Portland, Thomas M. Skiles of Maryland and Clarence W. Small of Portland, Me.

Invitations were extended to the assembly to hold its next meeting in Detroit, Jacksonville and Philadelphia. After a warm discussion with the new president in the chair, it was decided by a proxy vote that the convention be held in the city of the balmy winters.

#### Ex-President Potter's Report.

President Potter reported that the work of the year was carried on under trying difficulties. The outbreak of the war took many members and some prominent officers of the League to the scene of conflict. There had been some gains, but they had been small and not at all commensurate with the great amount of work done.

The report of Treasurer Tattersall showed a balance on hand January 1, 1899, of \$7,326.84; receipts since then, \$917.33; total, \$8,244.17; total expenditures, \$4,155.53; balance, \$4,088.64.

Secretary Abbott Bassett's report stated that there were enrolled last year 77,091 members, including applicants and renewals, surpassing the records of all previous years saving that of 1897.

#### Control of Racing Retained.

The executive committee on the abandonment of racing reported that after examination into the circumstances of the case the committee unanimously decided there is no other body in this country which is capable of governing racing, and that the transfer is not feasible at this time. The report was accepted on motion of Mr. Peleouze of Kentucky. The year vote was large and the nay vote was light.

At 5:30 the assembly started to consider Sterling Elliott's amendment to abandon the control of racing. The subject was contested for half an hour and then allowed to go over to Friday.

At the morning session the following day Elliott spoke in support of the amendment, and, the opposition having waived the right to speak at that time, he was followed by Judge Sims of New York, Conway Sams, G. F. Kireker and A. W. Robinson advocating the dropping of racing control. Elliott then closed the

debate for the anti-racing side and a vote was taken. Before the roll call was more than half over the necessary one-third needed to defeat the amendment had been cast and the final result showed that it had been lost by 69 to 161.

#### Professionals Allowed Representation.

Conway Sams then offered an amendment permitting professional racing men one representative in the National Assembly, which was adopted without division.

An amendment by Walter Sherwood of Indiana to strike out the word "amateur" from the constitution then came up for action and was defeated, the vote being 144 to 105 against, but the necessary two-thirds being lacking.

There was a long debate on the question of allowing former presidents, vice-presidents, chief consuls and secretary-treasurers who have served more than three years in divisions having a membership of 1,000 or more a seat in the National Assembly. Mr. Seward of Massachusetts made a speech in opposition to

T. J. KEENAN,  
PRESIDENT OF THE LEAGUE OF AMERICAN WHEELMEN.

the amendment, claiming that it would give "dead" men a representation and reduce the "live" ones to a minority.

The afternoon began with President Keenan's announcement that Boston had been selected for the League meet of 1899.

A resolution was adopted urging our government to secure a speedy settlement in the matter of indemnity from the Turkish government for the death of Frank Lenz.

#### Racing Men Reinstated.

Chairman Mott submitted a list of suspended racing men recommended for reinstatement, and when the report of the racing board was adopted later these suspensions were raised.

A strong appeal for the reinstatement of Earl W. Peabody, who was thrown into the professional class last year for riding a loaned bicycle, was opposed by two members of the racing board. A resolution recommending that the board reinstate him as an amateur was adopted, but as it lacked 11 votes of being unanimous the ex-amateur champion cannot be whitewashed for another year.

Conway Sams offered an amendment compelling all amateur racing men to register hereafter the same as professionals. If they are members of the League only 50 cents will be required; otherwise they must pay \$2 annually. Passed.

Kireker's amendment giving L. A. W. consulates and local organizations as well as League clubs representation on the state division board was adopted.

On a motion by Van Valkenburg the

assembly voted to re-enroll all those who, having been in the army and navy, had allowed their names to drop from the League. They will also continue to be members while in the service.

The president was empowered to appoint a press committee and establish a touring department.

The assembly adjourned at 4 o'clock.

#### Chairman Mott's Report.

Excerpts from the annual report of Albert Mott, chairman of the racing board, follow:

There are 621 professionals registered and the records show over 20,000 wheelmen engaged in racing either as professionals or amateurs. With the exception of a few of the larger cities, bicycle racing has been a financial success for both promoters and racing men. This is due to the fact that in the smaller places the expenses are much lighter and the attendance nearly as great on the average as in the principal cities. Especially is this true when some local amateur celebrities participate in the contests.

The classification of the racing men as professionals and amateurs still gives rise to the same conflict as has existed since the amateur definition was first incorporated in the constitution. Many amateurs, after they have been transferred to the professional class, have frankly admitted that they preferred to be amateurs simply because they could command a larger revenue in the amateur class than they could in the professional.

There are nearly 5,000 professionals upon the records, but only 621 participated in racing last year. There was a large falling off in the number of race meets in the west and there was no occupation for the thousands. Of the 621 registered professionals, ninety-eight are under suspension for participating in unsanctioned races.

#### Hits at the Seceders.

In the spring of 1898 a rather disorganized organization was formed by racing men, adventurers, speculators and one track association, and one of their leading men visited the office of the chairman and informed him that it was intended he (the chairman) should be at the head of the new government. The time before the opening of the racing season proving too short to attempt to carry their plans into effect, and owing to not meeting with the expected encouragement from track owners, they decided to postpone positive and definite action until the autumn of 1898, in the meantime keeping up the work for their cause.

The last National Assembly had forbidden the issuing of sanctions for six-day races, and the various promoters who annually give those exhibitors also promoted many other meets where sprint and middle distance races were held. The best material was required for these exhibitions, and accordingly the men who desired to form another organization received the aid and encouragement of those promoters in the autumn of 1898. While there was some temporary local success of the enterprise during the indoor season, it now has a precarious existence, and owing to well-known conditions can be but short lived.

#### National Circuit of 1898.

The National Circuit of 1898 was one in fact, where the professional national championships were run and where commensurate prizes were required. Before forming the National Circuit it was the universal understanding with racing men and promoters—even so much as in effect to amount to a contract—that if promoters assumed additional expenses of larger prizes, the racing men would follow the circuit. The racing men were held to their part of the contracts by the refusal of the board to grant special permits to other promoters to exceed the prize limit where it would conflict with the National Circuit meet. In every case where a National Circuit meet was given the promoters faithfully performed their contracts and promptly paid their prizes to the men winning them. The men made few attempts to get bonuses or appearance money before entering these races, and only once were they tempted to violate their implied contracts, and this was promptly checked.

For the first time in the history of the L. A. W. the members of the racing board have received a small remuneration for laborious and anxious work. In accordance with my agreement with the last National Assembly, when offering the registration amendment, to pay each member a sum not to exceed \$1,000, the funds of the board have permitted the transmission to each one of \$500. The sum received from registrations was \$1,242, but more than a like sum was added to the fund for this purpose by the practice of strict economy.

The financial statement shows that the total receipts were \$9,046.42. The expenditures were \$3,883.69, and this leaves a balance of \$162.73.

# \$10 FOR A TITLE==

VOL. XXII. No. 16.

THE CYCLE AGE OFFICE.

FEBRUARY 16, 1899.

## What Advertising Should Cost.

NEWSPAPERDOM, an authority of newspaper work furnishes the following:

"Here are the lowest rates, per 100 circulation per week, at which a country paper ought to accept electrotyped advertisements:—

600 circulation.....	6c. an inch
800 " .....	8c. "
1,000 " .....	10c. "

Ten cents an inch per 1,000 copies figures thus:

Cycle Age columns.....	11 inches
Rate per column, per 1,000.....	\$1.10
Rate per page, per 1,000 .....	3.30

At that price, CYCLE AGE need print less than 12,000 copies weekly to equal the lowest country newspaper scale—the scale adopted by the cheapest form of general medium.

### AN ADVERTISING AGENCY

will tell you that space in trade journals of the better class—such as the CYCLE AGE—is worth one cent per agate line per 1,000 copies, or 14 cents per inch.

Hence we obtain the following result:

Cycle Age columns.....	11 inches
Rate per column, per 1,000 copies.....	\$1.54
Rate per page, per 1,000 copies.....	4.62

On an advertising agency basis, therefore, the CYCLE AGE should print less than 8,500 copies.

As a matter of fact, the CYCLE AGE provides about twice the service which newspaper experts and advertising agencies say is fair.

## Plain Talks to Agents.

### The Man Who Buys

A dollar hat receives a dollar's worth —and no more.

### The Man Who Buys

A five-dollar hat of an honest hatter receives five dollars' worth.

### Something for Nothing

Cannot be obtained honestly or in the regular course of business.

### The Same Argument

Applies to newspapers. When you buy a fifty-cent journal

### You Get Good Measure

But the quality is poor because you obtain it at some other person's expense. When you buy a two-dollar newspaper you get quality as well, because

### You Pay Your Share

Of the cost of its production.

### Here Is the Proof:

The 50 cent newspaper lives on its advertisers.

It is published entirely at their expense.

It presents what THEY desire and that only.

It thereby misleads its readers.

The \$2 paper is supported to a great extent by its subscribers.

They contribute largely to its support.

It presents a great part of what its advertisers desire.

But it distinguishes between good and bad—Honesty and dishonesty—

Good goods and shoddy goods.

It doesn't guarantee everything an advertiser offers.

It is honest with its subscribers.

The CYCLE AGE is a \$2 paper.

If it printed twaddle in the shape of reading matter, designed to please advertisers but to FOOL you, your \$2 a year would cease.

It doesn't. That's why

The CYCLE AGE has the largest list of paying readers ever known in cycle trade journalism.

## Announcements.

.....

agents in the United States and Canada, and to 19,325 abroad. Send for analysis of the list and select the districts you desire to cover.

## Driving It Home.

Every blow of the pile-driver on a spile sends it into the ground a little way. The last blow sends it no further than the first, but it is the last blow, and it drives it home. It could not drive it home without all the blows that went before. Every advertisement helps which appears in the columns with previous advertisements before it. The longer your advertisement has been running, the harder it hits each time. The first time it appears in the newspapers, it does not do as much good as the second time; the second time is not so effective as the third time.—Princess Anne (Md.) Journal.

## \$25 FOR A KICK==

The CYCLE AGE will pay its Subscribers to Tell how it can best Please them.

The best Answer to the following Question received at the CYCLE AGE Office before March 1st is worth \$25 to the Subscriber who sends it:

Suppose you were the Editor of the CYCLE AGE, what changes, if any, would you make and why.

- Would you { Enlarge any Department?  
Decrease any Department?  
Omit anything it now Prints?  
Add anything?
- Do you like { The Illustrations?  
The "Information for Buyers?"  
The Motor-Car matter?
- Do you read { The Sport Department?  
The facts about America's Increasing Foreign Trade?  
For Amusement or Information?

Don't try to tickle our vanity by saying the CYCLE AGE is so good that it cannot be improved. If that were so every agent would be a subscriber. There are still a few who are not. We want them all.

Applicants for the 25 need not consult a dictionary for choice of words. Write as you feel—you'll hurt no one's feelings.

## SAILING ON SKATES

### Difficult Sport to Master Which Has Many Devotees in Germany and Scandinavia

There is one connection between outdoor winter sport and cycle trade which is seldom fully appreciated. Outdoor sports are ordinarily competitors of cycling. The more polo, golf, baseball, football, etc., are encouraged the greater is the danger that persons won over to those games may think less of cycling as a pastime, but in the case of skating and skate sailing and other exercises which are strictly confined to the season when

One of the most difficult of all sports to master is skate-sailing. It is not practised extensively anywhere, but has ardent devotees in Germany and the Scandinavian countries, where it is considered more exciting and therefore more attractive for real sportsmen than iceboat sailing. It has the advantage over iceboating that the equipment is simpler and cheaper and that it keeps the sailor in constant bodily activity. Maneuver-

trations, all of which have been used, probably only the two last ones would be acknowledged in this country as at all acceptable and those two forms have indeed also in Europe driven the three earlier styles almost entirely out of use.

At the regattas for skate-sailors which have been held on the "Havelseen" near Berlin, Germany, the triangular sail shown in Fig. 4 was generally preferred. Scandinavians on the other hand claim superior ease for maneuvering close to the wind with that of Fig. 5. In both cases the weight of the rig is supported on the sailor's shoulder by means of the gaff or cross yard.

#### Should Learn With Small Sails.

According to general experience the sail area should not exceed four square yards for the strongest and most skillful skater.

For beginners a much smaller area is

cycling is perforce dormant, the effect is reversed. They serve the purpose of keeping the desire for athletic diversions alive and tend to prevent the growth of those more effeminate winter habits which are likely to get the best of men after the age of twenty-five and cause their early withdrawal from all outdoor exercises. When catered to by the cycle dealer the winter sports also bring the class of people to his store during the otherwise dull season, who constitute his best patrons for bicycle business.

ing when once learned is also much quicker than with the long and cumbersome runner-supported frame which is termed an ice-yacht. The skating sail may be furled when the wind stills off and the skater may continue his pastime while with a boat under similar circumstances he is confronted with the task of towing the boat home—a labor which is so irksome as to discourage the most enthusiastic.

Of the five different forms of skating-sails shown in the accompanying illus-

sufficient with a brisk wind, to cause much trouble in keeping clear of the shore, open water or fellow athletes, but as soon as body and limbs have become accustomed to bracing each other mutually and the whole equipment against the fitful force of the atmosphere, and self reliance to lean against the wind and bend the body into the required positions has been gained, accurate and easy steering becomes an apparently easy art.

Long and flat skate runners are best adapted for the sport.

# INFORMATION FOR BUYERS

## "ALL-RIGHT" ADJUSTABLE SEAT CLUSTER.

The Maxim Mfg. Co., 258 Lake street, Milwaukee, Wis., maker of bicycle frame sets and fittings, calls especial attention of cycle builders to its "All Right" seat post cluster, which is shown in the accompanying illustration. The stay-tips on the cluster may be turned in their relation to the lug so that any angle required in building the frame may be secured, thus making the lug a universal fitting for high or low frames. Another feature of the cluster is the seat post

clamp, which, as will be noticed in the illustration, is operated by a small vertical screw placed at the rear of the post. This clamp binds tightly and is simple and durable. The company also manufactures the Axiom pedal, in which the bearings are placed at the extreme ends of the frame. The adjustments are outside and easily effected, and the bearings are large and durable, 5-32 balls being used.

## BIG SADDLE COMPANY REORGANIZED.

Some time ago the Cutting-Kaestner Co. of Chicago, successors to Cutting, Kaestner & Co., the well known firm of saddle manufacturers, was incorporated and a meeting of the stockholders held. Officers for the ensuing year were elected as follows: A. Kaestner, president; G. W. Bice, secretary; E. P. Ederer, treasurer. For the past five years this firm has been large producers of bicycle saddles, and reports an excellent outlook for '99. Ten distinct styles of saddles are catalogued.

## SANGER BAR WITH EXPANDER.

A very ingenious but simple method of fitting an expander to a reciprocating adjustable handle bar is employed by the Sanger Handle Bar & Plating Co. of Milwaukee, in its Sanger bar. As shown in the drawing herewith, the company simply grooves through the intermeshing ratchets which operate the two halves in unison and passes the expander bolt downward through the top of the tee. The lower end of the stem is split as usual and a tapered plug in-

serted and screwed onto the end of the bolt. About an eighth of an inch of the ratchet teeth is left on each side of the bolt, which is amply sufficient to allow the co-operating of the two sides or halves of the bar. The spur ratchet teeth simply cause the two halves to rise or sink in unison and play no part in the clamping, which is done by the meshing of the face corrugations drawn together by the bolts and nuts.

The Sanger is an adjustable bar which does not require turning around in the stem to change from low position to high or vice versa. Once set in the head of the bicycle

there is never an occasion to release the handle bar clamp or expansion bolt fastening, but the position can be altered at will and the wrist position is always correct, from highest to lowest point—a range of fourteen inches—and both sides are always automatically brought to the same level.

## BLODGETT'S BICYCLE CONSTRUCTION.

The accompanying illustrations show a gear-casing frame construction and a hub, which the inventor, J. W. Blodgett, 68 North Jefferson street, Chicago, intends to manufacture. The bicycle frame is intended to supply the demand for chain-driven bicycles with dust proof and self-oiling transmission gear, and Mr. Blodgett, having reached the conclusion that detachable gear cases cannot be made in a manner that will satisfy the American public, has incorporated the casing in the frame work, making the tubes which contain and protect the upper and lower chain reaches take the place of one of the lower rear fork sides. The machine which he has now made has an aluminum front sprocket wheel casing which is pressed over the bottom bracket end and also a rear sprocket casing of aluminum, and the two steel tubes, of oval cross section, which connect the sprocket casings are placed in the mold when the casting is made in such manner that the aluminum shrinks around the steel tubes. As the shrinkage of aluminum after casting is three times that of steel, while the fusion point is much lower, no further fastening of the connection is required, and the steel tubes are not injured by the process. In regular manufacture Mr. Blodgett will not use aluminum, however, and will construct the bottom bracket with a vertical flange to which the sprocket casing will be bolted. At the rear edge the casing is secured to one side of

a tee-shaped forging which takes the place of the lower rear fork crown and stem as known in three-crown construction. The circular flange of the sprocket case has a shoulder near its outer edge against which is set the cover lid secured with small screws. The central opening of the lid is provided with a dust and oil proof lining held in position by a metal disk on the inside and saturated with helmet oil, so as to allow the sprocket wheel hub or crank boss to revolve practically without friction. As there is no intention of adapting the construction to machines already made no difficulty is expected in securing perfect fit, smooth running and oil-retaining properties. The junction between the rear sprocket casing and the rear hub and the slotted opening in the disk which closes the rear casing are protected by similar means against the entrance of dust. A novel feature is the connection of the right side upper rear stay with the rear sprocket casing. Instead of the customary fork end fitting the stay has brazed to its lower end a circular disk, slotted to permit chain adjustment, and this disk fits exactly against a shoulder within the flange of the sprocket case and is held in this position by the axle nut only. So long as the axle and nut are in place the connection is firm, but when the axle is removed the union between the gear casing, which takes the place of rear fork side, and the stay is loose similarly as in one of the well-known English models in which the stays are assembled on the axle on the outside of the lower fork sides.

The rear hub construction shown is intended to be used in the Blodgett bicycle, but will also be sold in the trade separately in sets for front and rear. The axle is re-

movable, the cones being mounted on a sleeve, and together with the frame construction this serves the purpose of permitting the wheels to be removed from the frame, and again inserted, without separating the chain, so that riders in case of punctures or other causes which necessitate removal of the rear wheel, will have no more trouble than with an uncovered gear. It is a point of refinement as well as simplicity in the hub that the cones are mounted on the sleeve without screwthreading, the fixed cone being pressed against a shoulder turned on the sleeve and the adjustable cone provided with a feather entering a groove in the sleeve and preventing it from rotating

when it is pressed into proper adjustment by turning the operating nut on the screw thread. A close sliding fit between cone and sleeve is, of course, provided. To loosen adjustment all that is necessary is to spin the wheel. The dust flanges are double, as shown, and are to be fitted with felt washers.

## WORKING NIGHT SHIFT ON STEEL BALLS.

The Grant Ball Co. of Cleveland, O., which is catering to the buyers of high grade tool steel balls only, is gratified to find that the trade is largely discontinuing the use of cheap balls, which have proved very costly in the end, especially when they have been used in the hubs and crank hangers of bicycles. The company expects to run until midnight in every department until it can catch up with the orders already booked. The case hardening department has been enlarged in order to meet the growing demands for doing outside work. Balls up to nine inches in diameter are being made especially for use in large size derricks and similar work.

## MCGILL AUTOMATIC SEAT POST.

The McGill Automatic Seat Post & Handle Bar Co., 207 South Canal street, Chicago, is manufacturing a split seat post which is neat in appearance and simple in construction. The post is shown in the illustration herewith. As it operates by simply raising or lowering the pommel of the saddle when it is desired to release or tighten the post, it is not only a very convenient fitting on any rider's machine, but is especially adapt-

ed for use on renting bicycles, the saddles of which have to be constantly raised and lowered in order that the parties renting the machines may be suited. The annoyance of wearing off the corners of binding nuts through constant manipulation in rental stores is thus obviated, and the task of putting a cycle in shape for the patron much simplified and quickened. The sections of the post bind on the seat mast wall for their entire length, and so the tubing is

# A PAIR OF BICYCLES

THAT IT IS HARD TO BEAT

Model 20—Barnes Special, \$50.00.

These bicycles are light, graceful and easy running, and we doubt if a better wheel can be produced at the price. Our sales thus far on these models have

Model 23—Barnes Superba, \$50.00.

been away ahead of anything ever experienced by us before. We would therefore suggest that agents who are looking for a line to place them in the lead of their competitors should write us at once, provided we have not an agency in their city.

Our Handsome Art Catalogue with full particulars

saved from the danger of bulging sometimes caused by limited binding surface upon which great pressure must be brought in order to hold the post. Each section of the post is made from a single stamping, there being thus but three parts to the post in addition to the small pivoting screws. This construction allows the post to be made very light, without sacrificing strength or durability. By changing the position of a screw from one hole to another, the post may be changed from a front to a back L or vice versa.

**READING STANDARD SUCCESS.**

The Reading Standard Mfg. Co. of Reading, Pa., states that its sales of Reading Standard bicycles have been very gratifying and that its list of agents has already been much increased over last year. Shipments in 1898 amounted to 9,436 bicycles, and the company has calculated on building 12,000 machines this year, the bulk of this proposed output being already sold. The factory is running full force and the company is now ready to fill all orders from stock upon receipt.

**PLUME & ATWOOD'S ACETYLENE LAMP.**

A sectional view of the acetylene lamp made by the Plume & Atwood Mfg. Co., New York city, is shown in the accompanying illustration. The lamp is 6 3/4 inches in height. Granulated calcium carbide is used. Water is introduced through the feeder cap I to the reservoir surrounding the body of the lamp, the water supply being regulated by the valve K. The manufacturers state that the lamp is self-controlled and self-generating; that there is no need of adjusting the water supply as it is automatically controlled by the gas. A is the lava tip; B the valve hole in the lamp body; C the tube

entrance in the equalizing chamber; D the opening in the equalizing pipe; E the rubber distributor surrounding the equalizing pipe; F the equalizing chamber; G the carbide; H the water tank; and J the tip cleaning tool.

**SIDWAY STIRRUP CLIP PATENTED.**

The well known Sidway stirrup pedal, manufactured by the Sidway Mfg. Co., 240 Lake street, Chicago, is the invention of W. J. Grotenhuis, who has recently been granted a patent on the device. The patent claims embrace the construction of stirrup clips in which a metal base plate with upwardly projecting toe stops at the front end is furnished with a leather band forming a stirrup which is braced and maintained in its proper shape by metal strips curving upwardly and backwardly from the forward corners of the base plate. The patent also includes the use of a leather cover split through the center and laced together to form an adjustable stirrup.

**CLIPPER CHAINLESS AND CHAIN BICYCLES.**

The first few pages of the catalogue of the Grand Rapids Cycle Co., of Grand Rapids, Mich., are devoted to the interests of the Clipper bevel gear chainless. The Clipper people are ardent advocates of the bevel gear mechanism and have given much attention to the designing and making of such products. The attitude of the company on the chainless question is clearly brought out by the cover design, which depicts a male figure with hands bound together by a chain stretching his arms toward a bevel gear, from which is cast a flood of light symbolic of progress and release from the manacles.

Besides the men's and women's models of the chainless, a pair of Clipper Specials, a

Special racer, Model 44 with 30-inch wheels, two models of staunch \$40 machines, and a convertible tandem, are listed in the catalogue. The \$40 models do not have all of the novel improvements found in the Specials, but are offered as honest value for the price and without fear of their being frequenters of repair shops.

The Specials are fitted with a hanger yoke which has been used for some time by the Clipper people, and which has proven very

satisfactory as a means toward the necessary end of providing a narrow tread, ample tire clearance, and room for large sprockets, without weakening the construction of the rear frame or lessening its rigidity. It comprises, as will be noticed in the accompanying illustration, an elliptical section branch made integral with the bracket and having an arch crown on its rear end, to which straight D rear forks are attached.

A feature of the Clipper pedal is the oiling device. The cross bars of the pedal frame are hollow and lead to the ball races. Light spiral springs keep the balls in close contact with the mouth of these oilways when not pressed back for the insertion of the oil can nozzle. The catalogue is handsomely designed and printed and presents a novel idea in illustrating the various models, each pattern being shown in front view as well as the usual side views.

**ATTRACTIVE LIBERTY BROCHURE.**

The introductory remarks of the Liberty Cycle Co. of Bridgeport, Conn., in its catalogue state that the company does not desire to indulge in high art to excess nor to lead the prospective buyer by pictorial or other display, away from the consideration of the policy of making but one grade of bicycle. Throughout the catalogue, which has a very attractive cover in a red and brown relief effect, the idea of describing everything as briefly and intelligently as possible is carried out. The Liberty company calls especial attention to the fact that frames are furnished in two lengths. Those machines intended for riders who prefer the upright position are shorter than those for the scorching fraternity. The makers thus expect to fit the needs of all without requiring riders to assume cramped and unhealthful positions merely because the frames are not designed for the positions assumed.

**ATTACHED TROUSER GUARD.**

The illustration below shows a trousers guard which is the invention of C. W. Slevor of Keyser, W. Va., and for which the inventor has filed a patent application. The guard is placed on the sprocket wheel. It comprises a dished ring which projects

above the chain and, as stated by the inventor, makes unnecessary the use of the common ankle guard. A similar ring, though smaller, is secured to the left end of the hanger bracket to keep the trousers from catching on the oil cup.

**THE BANKER LINE OF STANDS.**

The Banker Bros. Cycle Co., of Pittsburg, Pa., has issued circulars describing its complete line of exhibition stands, street stands and home exercisers. All these are finished

in aluminum bronze, except the street stand, which is finished in black enamel.

The No. 2 exhibition stand is constructed of spring steel and sets the wheel three feet from the floor, thus placing the cycle in position to show its construction and talking points. An elegant felt covered display tray, with embossed brass moulding, adjusts automatically. This stand will take any length of wheel base up to 50 inches.

The No. 4 exerciser is constructed of spring steel. The friction roller has a brass boxing which revolves on a steel axle, and has an adjustment to take up the wear. This stand takes any length wheel base or width of hub, and holds a ladies' machine as well as a diamond frame.

The No. 5 stand is similar in construction to the No. 2 and will hold any size bicycle or multicycle.

The No. 6 street stand will hold eight bicycles and folds into compact form for shipment or storage.

A number of the largest cycle manufacturers in the United States are using the No. 2 stand for exhibiting their machines. Jobbers and exporters are requested to write for prices and electrotypes for catalogue purposes.

**NEW ENGLAND SUPPLY CO.'S REPAIR JACK.**

The accompanying illustration shows the assembling jack which is one of the many repair shop and factory tools manufactured by the New England Cycle Supply Co. of Keene, N. H., and on which a patent has been allowed, the patentee being H. T. Kingsbury. The jack holds the bicycle by the seat mast and lower frame rail, the grasp being cushioned so that the enamel is not marred and the release being quick and easily accomplished. The running parts of the bicycle are not interfered with, making it possible to entirely assemble or "knock down" a bicycle without removing

the frame from the stand. Conveniently placed foot and hand screws make it possible to tilt the bicycle in any desired position and to turn it over on its side for assembling or removing the hanger bearings. Attached to the metal standard are swinging shelves on which parts and tools may be laid while working on the machine held on the jack.

**BLUE STREAKS WELL CATALOGUED.**

The catalogue of the Black Mfg. Co. of Erie, Pa., shows the same care in every particular of its make-up as has characterized the Blue Streak Tribune bicycles. The decorative work in the book is treated in a tasty blue tint, which through purpose or by chance well symbolizes the company's well known blue finish. The illustrations of the light colored patterns are more than ordinarily attractive, it being usually found quite difficult to reproduce strikingly by half-tone cuts any but dark enameled machines. Besides picturing and describing the models, the catalogue includes illustrated paragraphs on the various distinctive points in Tribune manufacture and has also a page dedicated to a few good words for the cycloidal sprocket.

**CHANGE OF BULLIS BALL GEAR.**

After prolonged experiment, the Bullis Ball Gear Company, of Rochester, has found it possible to introduce an improvement which will prolong the life of the gear without interfering with its most valuable feature, which lies in the fact that the running qualities of the machine on which it is used are not seriously affected by knocking the gear out of its proper alignment. The improvement consists in changing the ball rollers on the transmission shaft into hollow cone rollers, which conform to

the curvature of the ball rollers on the front driving gear wheel and on the hub pinion in the same manner as the balls in a durable two-pivot ball bearing conform to the hollow races. Two-point bearings in which the races are well hollowed are now generally conceded to last much longer than those in which there is a strictly point contact, and on the same principle the improved Bullis Ball Gear will resist wear much better than the older form. Another advantage by the new design is that adjustment of the rollers is much simplified, so that now in fact all wear may be taken up by adjusting the cone rollers either in or out. An illustration showing the new form of the rollers on the shaft pinions will be found in connection with the company's advertisement in this issue.

**HURD AND ROCKFORD CYCLES.**

The Rockford Cycle Co. of Rockford, Ill., illustrates in its lately issued catalogue four patterns of Hurd bicycles and two patterns of Rockfords. The Hurd line is the highest in price and includes men's and women's road machines selling at \$50 each and a racer and 30-inch wheel machine listed at \$55 each. All of these models are of similar construction and have flush joints and popular frame lines and equipment. Standard finishes are Brewster green and black. The racer is enameled in vermillion. The tires specified include such standard makes as Morgan & Wright, Goodrich, Hartford and Kokomo. The men's and women's Rockford patterns sell at \$35 each. The style resembles in general lines that of the Hurd cycles though the options offered are not as broad. The frames have flush joints except at the seat cluster.

**TRINITY STRAIGHT SPOKE HUB.**

The direct spoke hub used in the models made by the Trinity Cycle Mfg. Co., of Kenne, N. H., are shown in the accompanying illustration. Adjustment can be made with the fingers by means of the disc wrench attached to the hexagonal end of the cone shown in the cut-away portion of the drawing. When adjustment is once made it is firmly locked by screwing up the axle

nut on the adjusting side. The dust groove in the cone in connection with the felt washer in a dust proof ball retainer is a device patented by the manufacturers. The cone is cut away from the outer side of the dust cup, so that when wiping the wheel the tendency is to carry the dust away from the bearings rather than to force it into them. For dust to reach the balls it is necessary for it to pass over the raised outer edge of the dust groove, which is constantly in contact with the washer, then through the greased groove itself, and again past the inner ridge of the groove and the felt protection, which is practically impossible.

**LINES TO A LATHE.**

"You will perceive from the inclosed," writes the W. E. & John Barnes Co. of Rockford, Ill., makers of all kinds of iron and wood working machinery and mechanics' tools, "that poetry sometimes finds its source even in the hearts of machinists and bicycle repairmen. An admirer of the Barnes lathe has compiled the following poem, incidentally suggesting at the end that we throw in a few tools and 'call it square.' Of course it was a bad precedent to establish, but we could not decline in this case. The poem was written by W. J. L. of Burlington, Wis., and may interest some of the readers of Cycle Age:"

**BARNES' LATHES.**

Ever graceful in their outlines,  
 Ever turning work that's true;  
 Ever made by Barnes at Rockford,  
 Ever seeming bright and new;  
 Lathes that run so smooth and noiseless,  
 Lathes with speeds both fast and slow;  
 Lathes for turning wood or metal,  
 Best of all the lathes we know.

**CATALOGUE OF FANNING BICYCLES.**

The colored cover of the catalogue of the Fanning Cycle Mfg. Co. of Chicago, displays a Fanning model finished in cardinal and bears the catch phrase, "Ride a Fanning and keep cool." The catalogue con-

tains, in addition to the usual illustrations of models and constructional features, a full page illustration of the Tribby front sprocket, which is of special Fanning design and protected by a design patent. On the last page is a price list of parts.

**HUNT SADDLE PATENTED.**

Among the patents granted last week is one allowed to J. A. Hunt of Westboro, Mass., on a form of saddle which is one of the popular patterns in the line manufactured by the Hunt Mfg. Co. The saddle, as described in the patent specifications, comprises a substantially elliptical base on which two pads or cushions are placed in the manner common to anatomical saddles. An important feature of the invention is

the arrangement of the springs. The main spring is of one piece of wire so bent that it practically forms an upper and a lower pair of springs. The wire doubles backward from the forward loop where it interlocks with a small light spring fastening to the front of the saddle base, and at the rear end is formed into two spirals which are secured at their highest points to the rear of the saddle. The free ends of the wire then extend forward again and pass through holes in the flange along the under side of the front of the base.

**KLING POWER CHAINS AND CYCLES.**

The illustration herewith shows the chain and rear sprocket used on the Kling Power bicycles made by the Kling Power Chain & Wheel Co. of Unionville, Conn. By hanging the links below the rim of the sprocket as the chain travels around it, the gear raising effect of a smaller rear sprocket is attained and the necessity for using excessively large front or dangerously small rear sprockets in order to obtain high gearing is avoided. The manufacturers claim that the chain also produces a saving in power of approximately 25 per cent. The chain and sprockets are furnished in sets for fitting to

any make of bicycle, and the company also builds complete bicycles fitted with the Kling Power chain. These machines retail at \$40 each, and in order to advertise them the firm has offered one \$25 share of preferred stock in the Kling Power Chain & Wheel Co. to each of the first 500 purchasers of its machines. The company is confident that its chain will become popular, one ground for hopeful expectations being that the chain does not present the bulky and ungainly appearance that has marked some of the previous chains of similar nature.

**KIRK MFG. CO.'S CATALOGUE.**

The catalogue of the Kirk Mfg. Co. of Toledo, O., is agreeably free from tiresome reading matter, and forcefully states the main points of interest about Yale bicycles

in as brief and systematic a manner as possible. Besides illustrating the various models in the Yale line, the different styles of handle bars, saddles and tires fitted to the machines are also shown. A paragraph in the introduction invites all patrons or prospective patrons of the house to call at the factory whenever in Toledo, and states that the firm will be glad to show them through the works for the purpose of demonstrating that its claim for care and skill in the construction of its bicycles is something more than catalogue and advertising talk.

**McELROY AUTOMATIC COASTER AND BRAKE.**

The manufacture and sale of the McElroy patent automatic coaster and brake has been undertaken by the Frank E. Bundy Lamp Co. of Elmira, N. Y., in connection with the Bundy Automatic acetylene lamp.

The coaster and brake device is very compact and simple, as shown in accompanying illustration, and can be made to fit to the rear hub of any bicycle; it also avoids wearing of the tire, while at the same time doing all the work that is expected of such devices. It is composed of two disks revolving with the hub with a wedge mechanism in the center, and is operated with the chain by a slight backward pressure on the pedals, thus allowing the rider to coast at will with his feet on the pedals and also to control his machine by applying back pressure on the pedals as the emergency requires. If necessary, the rider can stop his rear wheel altogether. In its normal position the rear sprocket is locked and there is absolutely no friction. The device is also so contrived that, should the rider desire to give up the use of the coaster and brake by removing one small part, it can be made to run as an ordinary rear sprocket.

The mechanism has been thoroughly tested in the factory and a large number have been ridden from five to six months. The great advantages claimed for it are that it is neat, compact, and can be attached to any bicycle or removed at will by the rider; is simple in construction; always responds quickly to a

forward pressure; increases the weight of the wheel only 10 ounces and the rider can dismount with pedal in any position. The Bundy company is now fitting up its plant with new machinery to place this on the market, and will send full description and prices to all applicants.

**CATERING TO SMALL MAKERS.**

'Twenty-two years' experience in endeavoring to meet promptly and satisfactorily the demands of a multitude of customers has enabled the Excelsior Supply Co. to so systematize the work of its various branches that Mr. George T. Robie, the manager, is now able to claim, with justice, ability to supply anything and everything required by bicycle builders. No matter how small the order, so long as it reaches the company before 4 o'clock a very good reason must be given for failure to ship the goods the same day.

A rapidly increasing volume of business recently rendered a large increase in available space necessary. The company therefore secured a lease of the entire building at 88 and 90 Lake street, Chicago, and took possession at the beginning of the year. The work of arranging the immense stock of parts, sundries and material of all kinds is not yet quite complete, but the system under which all things are handled furnishes satisfactory evidence that, come what may, the company can supply, at a few minutes' notice, anything an agent, repairman or builder may require.

Heavy stock, such as tubing, forgings and rough parts, is of course stored in the basement. The first floor is devoted to offices and such stock as is necessary to supply on the instant, goods sold over the counter, which, by the way, means an immense volume of business in itself. The four floors above are used for store rooms, drawing rooms and advertising department, an experimental department also forming part of the outfit. Each department can tell, down to a gross of balls, exactly what it has in stock.

The sources of supply, however, do not end there. Experience shows the desirabil-

ity of being able to provide parts of machines long out of date but treasured by some old-timer. The company figures that the goodwill of the agent who enquires is worth cultivating, and that his knowledge that his every requirement will be met will make him a permanent customer. Hence a small but complete machine shop is kept for the purpose of producing such antiquities or special parts as may be required.

The company is preparing to send out its new catalogue. It consists of 96 pages of matter descriptive and illustrative of all sorts of supplies. These are to be addressed largely from its own lists, which, by the way, are handled with the same attention to detail as characterizes other departments. Every agent who has been in the business long enough to have made a record, good or bad, may rely on it that he is on file and rated at the offices of the Excelsior company.

Mr. Robie is fully convinced that the small maker is a fixture in the trade and furnishes many incidents to support his opinion. Just so long as that idea prevails will the Excelsior company persevere in a determination to prove the truth of its motto, "Everything for bicycle builders."

#### CARBIDE CARTRIDGES ARE SAFE.

The Frank E. Bundy Mfg. Co., makers of acetylene lamps, recently received the following letter from the chairman of the acetylene gas committee of the Underwriters' Association of the State of New York:

"I brought your lamp before the committee of which I am chairman and they agreed with me that it will not be necessary to have any permit granted in order that a storekeeper may keep the cartridges that you use for your lamp in stock. Our ruling is that they comply with the present insurance requirements, which say that calcium carbide can only be kept in an insured building when contained in hermetically sealed tin cans, and this plan you have complied with in your construction of the cartridges."

#### THE REMINGTON CATALOGUE.

The recently issued catalogue of the Remington Arms Co., of Ilion, N. Y., is plain and neat, and while covering every important feature of Remington construction is not loaded down with tiresome descriptive matter or uninteresting illustrations. All illustrations of models and parts are carefully made tooled half-tones. The policy of the company as brought out in the catalogue embraces the same conservative, reliable methods as those practiced for many years so successfully in the manufacture of firearms, and the models shown have the same simplicity and refinement of design which have so long characterized Remington bicycles.

#### THE VANGUARD BICYCLES.

The catalogue of the Vanguard Cycle Co., 140 S. Capitol avenue, Indianapolis, Ind., illustrates several machines of the popular type listed at moderate prices. The company's catch phrase states that the cycles are "Built for service." The Vanguard, Model B, is built in both men's and women's patterns, and lists at \$35. Two models of the Progress list each at \$25, and boys' and girls' machines in three sizes each are cata-

logued respectively at \$20, \$25 and \$30. The company is also building a chainless with the Sager gear. This machine sells at the standard chainless price of \$75.

#### WORKING DAYS AND NIGHTS ON VICTORS.

Notwithstanding the Overman Wheel Co. of Chicopee Falls, Mass., has orders for nearly 15,000 bicycles on its books, the company's agents are to have their wants supplied promptly, for the factories are being run twenty-two hours out of every twenty-four and the stock of completed machines is increasing rapidly. Production is very much facilitated, it is claimed by the fact that only one model is being manufactured for this season's trade. In this one model, however, are combined all the best qualities and

mechanical features of the preceding Victor machines, together with a number of new features which makes this latest product superior to any Victor that has been brought into existence before.

The chainless Victor which attracted so much attention at the New York show, will not be ready for delivery before the latter part of March, however.

A large sale of Victor tires, which the company offered to the trade a year ago, is reported by the company. The capacity of the tire plant has been doubled within the year. The company now announces that it

is prepared to supply Victor saddles to the trade in any quantity and desires agents for Victor goods in all places in the United States and foreign countries where agents have not already been appointed.

#### MONARCH CYCLES IN GREECE.

The Crown Prince of Greece recently placed an order for a Monarch bicycle during an interview at Athens with Mr. Krausz, foreign representative for the Monarch Cycle Mfg. Co. Mr. Krausz writes his house that the sport of cycling has not yet developed to any great extent in Greece, there not being over three hundred machines in the whole country. These are mostly English and cheap American models. The roads

being good, and the country recovering somewhat from the late war, there will doubtless be an increase in the bicycle business in that country in the near future. At Athens, on January 23, the Monarch scored in two racing events.

#### MAGNET HUB PATENTED.

The hub manufactured by the Magnet Cycle Co. of Chicago is not protected by a design patent recently granted to P. H. Barker. The distinctive feature of this hub resides in the spoke flanges, which are much larger in diameter than usual and for the sake of appearance and lightness have drilled through them concentrically arranged holes. The value of the large flanges is that a greater angle of spoke spread may be obtained without widening the hub and chain line, thus giving the hub an apparent advantage when used in 30-inch wheels.

#### TO PUSH MONARCHS IN CANADA.

Robert Jaffray, recently connected with W. H. Fligg of Montreal, who represents the Columbia line in that city and in eastern Ontario, has associated himself with the Monarch Cycle Mfg. Co. as traveling representative in western Ontario. Mr. Jaffray was at the Monarch factory the first of this week and left on Tuesday night for Toronto.

#### INCREASED FACILITIES FOR PEDALS.

Edmonds & Metzel, makers of the Perpetual pedals, have removed from 115 Monroe street, to larger quarters at 253 South Canal street, Chicago, where their greatly increased manufacturing facilities place them in position to fill orders on short notice and quote interesting prices on light running pedals of superior quality.

#### TRADE NOTES.

Chas. Beltz & Son, 5811 Penn avenue, Pittsburgh, Pa., dealers in bicycles, saddles, accessories and sporting goods, are desirous of receiving catalogues and lists from manufacturers of parts, fittings, sundries, etc.

Coincident with the re-organization of the Frontenac Mfg. Co. of Syracuse a policy of general extension of the business was decided upon. The services of C. Edward Wood, recently connected with the Hollenbeck Saddle Co., have been secured and he will have charge of the sales department.

New specialties are being continually added to the already large line made and sold by the National Cement & Rubber Mfg. Co. of Toledo, O., which has a businesslike way of saying nothing until it is ready to market each new article in quantities, when it comes out boldly and pushes it hard, frequently to the discomfiture of competitors.

During the New York cycle show the Olive Wheel Co. of Syracuse was well represented in connection with the National Cement & Rubber Mfg. Co. of Toledo, the following representatives of the bicycle house making their headquarters in the sundries company's booth: C. A. Benjamin, C. J. Batchrie, Henry Trebert and George N. Jordan.

## AFTER ALL.....

### A PERFECT SEAT.

FOR MEN AND WOMEN.

Cyclists are not slow to appreciate a good thing, and the wheelmen generally are singing the praises of

LIGHT—PRETTY—DURABLE.

## The Hollenbeck Rawhide Saddle

And Comfort to the Rider and Beauty to the Bicycle

By using the HOLLENBECK HYGIENIC SADDLE, made of the best materials, and on perfect anatomical principles. It will add to the beauty as well as the riding qualities of your machine. It is fitted with our new lock-tilting clamp and improved spring, giving a 4-inch range of adjustment, without disturbing the position of the saddle.

Mr. Dealer:—You want these Saddles in stock. Our prices are attractive.

**HOLLENBECK SADDLE CO., SYRACUSE, N. Y.**

## The Standard Bar of the World

Has 15-inch adjustment and 25 positions, with no change in pitch of grips, same as demonstrated at the shows in Chicago and New York

Over fifty of the leading manufacturers are supplying these Bars as their regular equipment. . . . .

Kindly say in your letter in which paper you saw this ad.

**The Kelly Handle Bar Company**

Cleveland, Ohio, U. S. A.

### PATENT NOTICE.

#### S. & G. STIRRUP TOE CLIP.

Our U. S. patent No. 618,937 for the S. & G. STIRRUP TOE CLIP, was issued Feb. 7, 1899, and by its provisions gives us exclusive control of the STIRRUP TOE CLIP in all its practicable forms of construction.

We now respectfully give notice to all concerned, that we shall take such steps as are necessary, to protect ourselves against the manufacture or sale of any TOE CLIP which is an infringement on our rights, under this and our similar patents, in Canada, Great Britain and France.

SIDWAY MFG. CO., = Chicago, Ill., U. S. A.

### "CONSENSUS OF OPINION"

THE S. & G. COMBINATION PEDAL

Perfect in every respect. Is the finest ever devised.

1427-1457 Woodward Ave., DETROIT, MICH.

Chicago Distributing Agents: HIBBARD, SPENCER & BARTLETT. New York Distributing Agents: HARTLEY & GRAHAM.

**MISCELLANEOUS.**

Advertisements under this head 5 cents per word first insertion, 3 cents per word each insertion thereafter. Cash with order. Express orders, postoffice orders, or stamps received.

**WANTED**

**WANTED**—A man having full knowledge of the manufacture of double-tube bicycle tires and inner-tubes. Address G. H. R., Postoffice Box 1553, New York, N. Y.

A **GENTLEMAN** with long experience in the bicycle business, both in this country and Europe, and now connected with one of the leading bicycle manufacturing companies, will leave for London and the continent shortly in the interest of his company to place agencies and in connection with bicycles would like to make arrangements with a few leading manufacturers in kindred lines, such as parts, fittings, or accessories, to represent them on some equitable basis, either commission or share of expenses. Is well acquainted with the foreign trade, competent to handle important business and absolutely reliable. This is not a pleasure trip but strictly business. Any one interested may address M. C. Co., care Cycle Age.

**WANTED**—Good agents in all parts of the United States and Canada to sell our contracts. We are the oldest bicycle protective company in the world. Our contracts sell easily. Write at once for particulars and territory. Liberal commission. **UNION WHEELMEN'S PROTECTIVE CO.**, 618-630 The Temple, Chicago, Illinois.

**POSITION WANTED**—A No. 1 repairman, with tools and good references, wants position. **H. G. FREEMAN**, 712 W. 8th St., Sioux Falls, S. D.

**BEST LOCATION**—Largest store in Minneapolis. Offers invited from manufacturers to add bicycles. **UNION BOOK CO.**, 6 Washington Ave. S., Minneapolis, Minn.

**WANTED**—Salesman to carry complete line bicycle sundries on commission. **CLARK, HORROCKS & Co.**, Utica, N. Y.

**WANTED**—A motor phaeton to seat 16 or 18 people. In answering state style of machine, what per cent of grade will climb, and cost. **L. F. SNOEDAL & Co.**, 2552 Madison Ave., Baltimore, Md.

**MANUFACTURERS**—Gentleman, trained engineer with central London office, many years' experience in the cycle trade, large connection amongst manufacturers, factors, shippers and agents, is open to take up and thoroughly work through travellers and himself a good sole agency for cycles, components or stampings, etc.; best firms only entertained. **R. M. P.**, care Cycle Age.

## DENVER DEALERS ARE ALARMED

**The Population is Too Small to Support Those Who Are Competing for Custom.**

Denver, Colo., Feb. 19.—The opening of the present season for the cycle dealers of Denver is to mark the beginning of a "hot time." The trade conditions are serious. To the dealer they are vital. While this city may not be alone in presenting such knotty problems, the conditions are at least interesting to the trade in general.

### Too Many Bicycle Dealers.

Denver has an estimated population of 150,000 and boasts of at least thirty regular bicycle dealers, including three department stores, all of which handle at least one high grade line. Among the regular dealers there are several whose retail sales were near the thousand mark for 1898 and a large number between three and six hundred for the season. Nearly 7,500 machines were sold in 1898 and the present season must see a sale of from 10,000 to 12,000 to make a reasonable business for the dealers to show even a small profit. The question is whether a city of this size will furnish so many new customers each year, 30,000 people being already in possession of mounts that will do service for a few years more.

All those connected with the cycle trade realize that a critical time is at hand for them, but every dealer has hope and expectancy in his eye when asked about his prospects for the coming year.

### Side Lines in Demand.

Side lines are sought by all. The wholesale sundry houses have added from two to five separate lines to enable them to stay in line. Sundry dealers have increased at an alarming rate and eastern prices are quoted by many with Denver deliveries. The knife is applied vigorously to all prices and goods can be had at bed rock prices everywhere.

During the week beginning February 20 a cycle show will be held at the scene of two former shows. This show will present the novelty of furnishing exhibition spaces, platforms, etc., to all exhibitors at absolutely no cost. The promoter, G. A. Wahlgreen, of Cycling West, has formed a plan that meets with general approval and will have a larger number of exhibits offered than he can furnish space for. The exhibits will include autocars and motor driven vehicles of all kinds.

The unprecedented cold weather has delayed the opening of the season at least a month, but the "hot time" will begin not later than March 1.

### Fire Will Cause Little Delay.

The fire which damaged the plant of the Manhattan Brass Company in New

York city February 12 did no injury to the rolling mills, wire mills, tube shops or lamp burner department, and will not interfere with the work of these departments nor to any extent with the production and shipment of lamps. The lamp factories and a portion of the manufacturing department were partially destroyed but will be immediately rebuilt. After an unavoidable delay of two or three days, however, all orders will be taken care of with the usual promptness.

### Death of David Bradley.

David Bradley, president of the David Bradley Manufacturing Company of Chicago, one of the largest concerns in the country producing farming implements and which also makes the America bicycles, died Sunday morning at his residence in Chicago, aged eighty-seven years. He moved to Chicago in 1835 and the following year established a small shop for the making of mechanics' tools. From this has grown up the immense business now conducted in Chicago and in the new plant located just outside of Chicago in the town of Bradley. It is expected that the business will be managed hereafter by his sons, J. Harley Bradley and B. C. Bradley, vice-president and treasurer of the company.

### New Warwick Company Formed.

All the bicycle tools and stock of the old Warwick cycle plant have been taken over by an entirely new company which has been organized under the style of the Warwick Cycle Co., with New York offices at 34 Union Square, East, which will continue the manufacture of Warwick bicycles in Springfield, Mass. George A. Russel, president of the former company, is president of the new concern, while A. O. Very, former treasurer, will occupy the same office with the new company and at the same time be general manager.

Nothing but first class machines will be produced and a feature of the work will be the manufacture of chainless machines. The New Warwicks will be marketed only from the New York office.

## RIVALRY OVER SUB-AGENCIES

**Buffalo Dealers Alert for Trade of People Who Reside in Remote Parts of the City.**

Buffalo, Feb. 21.—Quite a bit of rivalry has sprung up among the Buffalo retail trade in the matter of placing sub-agencies in the city. While the idea is by no means new here it was not followed out to any great extent until last season, when one of the local branch managers believed he saw in it an opportunity to increase his business at a little additional cost. He placed a few sample machines with several of the repairmen and in small shops in districts remote from the business center of the city. The experiment proved so successful that he expanded, as it were, and soon had the most desirable territory covered by agents under contract to sell his machine.

### Competitors Get to Work.

When it was learned by others of the craft that there was some business to be had through this channel they set about getting some of it, but everywhere they went they found that the other fellow had done his work so well that no openings were left. The various schemes that are alone known to the trade were then launched, it is said, in an attempt to get his agents away from him, but he was so firmly entrenched that all efforts were in vain. As the time approached for making contracts for '99 there was a general scramble for the most desirable districts and the rivalry increases daily.

### Sub-Agency System Pays.

A surprisingly large business was done last year through these agencies. The manager referred to claims to have sold over a hundred machines, and others who had agencies, or later established them, did a paying business. The sales were made on commissions said to net the seller \$5 per bicycle.

There can be no question as to the value of these establishments to the trade at large, especially in districts remote from the business centers. The laboring classes reside largely in these districts. They go to their labor early and return late, and it is seldom, even if they have the inclination, that time can be found to visit the city stores; so when it is found that the same advantages can be had at the agency in their neighborhood, as at the up town stores, they will buy, where if the conditions were different the probabilities are that two-thirds would not.

J. H. Johonnot has retired from the firm of Cassette and Johonnot, Buffalo agents for Olive bicycles, and has accepted the position of manager of the bicycle department of Weed & Co., who handle Wolff-Americans.

Finn & Sullivan, who shifted from the bicycle to the grocery business last fall, have returned to the cycle and will sell Orients this season.

## LOCAL CYCLE SHOWS

### The Philadelphia Exhibition Draws Well Despite Poor Weather—The Springfield Show

Philadelphia, Feb. 20.—It is perhaps fortunate that the cycle show which was opened last Saturday evening under the management of the local cycle board of trade partook less of a national character than its promoters had hoped, for otherwise the evidences of unpreparedness manifest at many of the booths must have been increased manifold. As it was, some of the dozen or more out-of-town exhibitors were not on hand, their show material having been snow-bound on the road as a result of the blizzard earlier in the week. This was especially noticeable in the case of the automobiles, several of which were held up somewhere between here and Chicago and a number of others between Boston and this city.

#### It Rained the Opening Night.

While the pouring rain and the ankle-deep slush undoubtedly interfered with the opening night attendance, there was nevertheless a paying crowd present. President Brewster is hopeful that the present week, with its two holidays, election day and Washington's birthday, will more than make amends for the comparatively poor opening night crowd. Last Saturday night's crowd, under the meteorological conditions, certainly indicated no lack of public interest. The majority of the exhibitors seem to think that the show will have a beneficial effect, upon the retail trade especially. Those of the exhibitors who were represented at Chicago and New York were satisfied with the prospects, and intimated that in general appearance the exhibition compared favorably with its two prototypes, although not so comprehensive.

A striking feature of the show is the rivalry among the lamp men. Oil, acetylene gas and electricity—each has its advocates and followers, and the constant din of explanatory volubility gives one the impression of side show barkers at a country fair. But they're doing business, which, after all, is what they are after.

While the souvenir feature is not so apparent as in former years—due, perhaps, to the comparative smallness of the crowd—advertising schemes are not wanting. Guessing contests and free chances on pianos, phonographs, bicycle lamps, etc., may be mentioned in this connection.

#### The Exhibitors.

The following list of exhibitors will give an idea of the extent and character of the show, which is the third held under the management of the Philadelphia Cycle Board of Trade:

W. E. Anderson, Harrisburg, Pa.  
C. S. Armbruster, Philadelphia.  
Armbruster & Reed, Elmer, N. J.  
James Bellak's Sons—Keating and Elgin King lines.  
Frank E. Bundy Lamp Co., Elmira, N. Y.—Acetylene gas lamps.  
Claus Handle Bar Co., Milwaukee, Wis.—Adjustable handle bars.  
Clothier & Burrows, Philadelphia—Roman bicycles.  
Collins Pneumatic Hub & Wheel Works, Sayre, Pa.—Pneumatic hub wheel bicycles.  
Cosmos Bicycle Mfg. Co., Philadelphia—Capitol bicycles and specimens of enameling and electroplating.  
Michael J. Costa, Philadelphia—Union, Relay, Laurel and Viking bicycles.  
Cressman & Co., Philadelphia.  
Cushman & Denison, New York City—Pocket oilers, etc.  
Cycle Syndicate, New York City—Cycle specialties, Rusch saddles and Excelsior lubricant.

Devine Wheel Mfg. Co., Philadelphia—Luxury cushion tire bicycle.  
William Diebel, Philadelphia—Reading Standard bicycles and specialties.

Jos. Dixon Crucible Co., Jersey City, N. J.—Graphite in various forms.

F. L. Donlevy & Co., Philadelphia—Syra-cuse, Packer, Don and Andrae bicycles.

W. A. Ennis, Philadelphia.  
R. D. Garden, Philadelphia—Crescent bicycles.

B. F. Goodrich Co., Akron, O.—Tires.  
Hart Cycle Co., Philadelphia—Columbia, Hartford and Vedette bicycles.

Hawthorne & Sheble, Philadelphia—Dayton bicycles.

A. R. Justice & Co., Philadelphia—Iver Johnson, World, Trinity and Emerson bicycles.

Keeler Mfg. Co., New Albany, Pa.—Keeler flexible bicycle coupler.

LeFevre Mfg. Co., Philadelphia—Specialties, including bicycle stand, enameling stand, truing stand, wheel truer, sanitary saddle and spoke wrench.

John S. Leng's Son & Co., New York City—Ensign and Snell bicycles and specialties.

H. A. Lozier & Co., Cleveland, O.—Cleveland bicycles.

Manufacturers' Supplies Co., Philadelphia—Bicycles, supplies, fittings and sundries.

McCallister & Van Mater, Philadelphia—Crawford, Crown, Hoffman, Pierce and Race cycle bicycles.

William P. Miller's sons, Brooklyn, N. Y.—Excelsior bicycle lubricants.

Norman Wheel Co., Philadelphia—Norman bicycles.

Philadelphia Optical Co.—Bicycle glasses.  
Ramsay Swinging Pedal Co., Philadelphia—Swinging pedals and toe clips.

Jacob Rech & Sons, Philadelphia—Sterling, Clipper and Featherstone bicycles.

Wolfgang Richter, Philadelphia—Acetylene gas lamp.

Wm. B. Riley & Co., Philadelphia—Bernasco saddles.

Roach & Barnes, Philadelphia—Stearns, Waverley, National and Clover bicycles.

George W. Robb Cycle Co., Philadelphia—Light and Olive bicycles.

Rose Mfg. Co., Philadelphia—Neverout lamps.

Rowland & Christ, Philadelphia—Exercisers.

H. H. Sawyer, Philadelphia—Wolff-American bicycles.

D. B. Saxton, Philadelphia.

J. B. Shannon, Philadelphia—Remington bicycles and sporting goods.

Charles S. Smith & Co., Philadelphia—Rambler, Ideal and Reading Special bicycles.

Marshall E. Smith & Bro., Philadelphia—Spalding and Marshall bicycles, sundries and sporting goods.

N. Snellenburg & Co., Philadelphia—March bicycles and bicycle clothing.

R. C. Stevens, Philadelphia—Erie bicycles.

A. P. Swoyer Co., Philadelphia—Searchlight gas and oil lamps.

W. W. Taxis, Philadelphia—Union, Delaware and Peerless bicycles and Record pedals.

E. K. Tryon, Jr., & Co., Philadelphia—Stormer and Pennant bicycles and general sporting goods.

Twentieth Century Mfg. Co., New York City—Oil lamps.

Veeder Mfg. Co., Hartford, Conn.—Cyclometers.

Wessels & Walz Cycle Co., Philadelphia—Liberty bicycles.

H. T. Wise & Co., Philadelphia—Cements and lubricants.

William Wrigley, Jr., & Co., Philadelphia—Wrigley and Kinzie bicycles.

### SPRINGFIELD CYCLE SHOW

Local Exhibition in Massachusetts Succeeds Despite Untoward Weather—Business Transacted.

Springfield, Mass., Feb. 20.—The cycle show held in the Auditorium last Tuesday, Wednesday and Thursday was the most pretentious effort in that direction that has yet been made in Western Massachusetts. The number of exhibits was not so large as the management had hoped for, but those who had booths express themselves as satisfied with the

experiment and willing to engage space another season.

The show encountered the severest snow storm in recent years, and it was found impracticable to get motor vehicles inside the Auditorium. Despite these drawbacks the show cleared expenses. Several exhibitors made sales for spot cash and one manufacturer placed agencies in four neighboring towns.

The exhibitors of bicycles were as follows: M. D. Stebbins, the Chilion wood frame bicycle; George Sibley, the Dayton; White Sewing Machine Company; E. A. Nelson, Trinity and Olive; Forbes & Wallace, Keating and Lenox; Hendee & Holden, Indian; Guy Furniture Company, Monarch; Luther-Eames Company, Eagle; Taylor & Son, Stearns; Industrial Cycle Company.

### Week's Exports from New York.

Exports of bicycles and bicycle materials from the port of New York for the week ending February 14 are recorded as follows:

	Bicycles.	Mtls.
Germany . . . . .	\$14,343	\$9,258
France . . . . .	11,634	2,146
England . . . . .	9,656	3,534
Belgium . . . . .	3,355	1,575
Argentine Republic . . . . .	3,988	.....
New Zealand . . . . .	2,489	.....
Russia . . . . .	2,047	.....
Holland . . . . .	1,818	387
Brazil . . . . .	1,343	.....
Australia . . . . .	108	540
Denmark . . . . .	500	170
Mexico . . . . .	243	398
Uruguay . . . . .	420	.....
British Guiana . . . . .	399	.....
Scotland . . . . .	50	250
British East Indies . . . . .	97	160
China . . . . .	232	.....
Austria . . . . .	.....	210
Sweden . . . . .	176	.....
Cuba . . . . .	156	.....
Venezuela . . . . .	.....	41
Porto Rico . . . . .	38	.....
British West Indies . . . . .	20	.....
Totals . . . . .	\$53,115	\$18,669

### Freezing of Acetylene Lamps.

Several instances have been reported this winter of the freezing of the water in the reservoirs of acetylene lamps when riding on cold days. To avoid this one should not fill the reservoir until approaching darkness warns that lighting up time is at hand. Nor should the light be permitted to go out while the rider is resting and warming himself indoors. Except in excessively cold weather the heat of the chemical action in the carbide and of the burning gas is sufficient to prevent freezing of the water when the lamp is in use.

### Fire Damages Artemis Plating Works.

The offices and salesroom of the Artemis Plating Works, at 73 West Jackson street, Chicago, were damaged by fire last week at an estimated loss of from \$75,000 to \$80,000 on stock and fixtures. Insurance adjusters are now taking an inventory, and it will be a week or ten days before affairs can be straightened out and shipments made. The factory is on West Fourteenth street.

### Restraining Order Against Vehicle Tax.

A temporary restraining order against the enforcement of the new ordinance passed in Terre Haute, Ind., requiring the payment of a license by all users of vehicles and bicycles in the city streets, has been issued by Judge Piety upon the petition of a large number of cyclists and prominent citizens who own carriages.

Most of the goods exported to the South African Republic pass through Port Elizabeth, which is 839 miles from Cape Town by rail, has a population of over 25,000, and is the second city of Cape Colony in importance.

**SHOW FOR NEW YORK DEALERS**

**SUBSTITUTE FOR "OPENING DAY"**

**Houses Not Represented At January Exhibition Are Evincing Interest in the Affair.**

Somehow or other it has come to be recognized as the correct caper for outsiders to charge a smart price for serving the interests of the retail cycle trade in such matters as local shows. To this general custom there is but one noteworthy exception, to wit, the Denver function, which is being housed and staged free of cost to exhibitors by a man of experience whose affectation of interest in the affairs of his exhibitors is real and not spurious. The cry of "free space" has been heard so often of late that it would not be surprising if this much coveted gift were really to be the trade's portion on the occasion of all future shows, except in such cases as when the dealers or makers finance and conduct the exhibitions.

A \$16,000 Guarantee.

Though the promoters of the New York dealers' show, which is to take place at the Grand Central Palace from March 23 to April 1, declare that they are meeting with hearty encouragement, yet like the promoter of the January exhibition they will take no chances on the gate.

Nothing but the test of public attendance, however, will decide whether the promoters of this second cycle exhibition are ahead of time with their project or have been blanketed by the prince of showmen, as Col. Pope admirably calls the urbane Sanger. But be this as it may, they are shrewd enough at finding a philosophy to match their enterprise, and here it is:

**Argument for the Show.**

"The show is designed to take the place of the 'spring opening' scheme which was tried last year by the New York dealers, offering an opportunity for agents to display their lines at a time when the roads are beginning to become suited for continuous riding and wheelmen may be presumed to be ready to place orders and deposit money for immediate deliveries. 'Spring openings' attract buyers, but, widespread as are the establishments of the New York dealers, it is not possible for any of them to secure the visits of more than a comparatively small portion of the entire number of buyers, few of whom are able to find time to go the rounds of all the stores in which the goods they wish to examine are on sale.

**Certain Makers Evince Interest.**

"Space diagrams and other printed matter concerning this exhibition have been distributed among all the dealers in bicycles and sundries in New York and among local branch houses, and have also been sent to manufacturers, as it is presumed that many of the latter will wish to take up with their agents and branches nearest New York the matter of having their product represented. Considerable interest is being evinced by manufacturers who were not represented at the recent shows, and who, according to their statements, regard the local show as an institution to be cultivated."

**Tourists' Customs Privilege Abused.**

The reciprocal customs arrangement consummated last year between the United States and Canada, whereby members of the L. A. W. and C. W. A. can

take their bicycles across the border free of duty by presentation of their membership tickets to the customs officers and a statement that they will return with the machine within a certain limited period, is in danger of being abrogated because of the failure of about fifty riders from this country to return within the specified time. L. A. W. officials are making strong efforts to keep the agreement in force and the League may even go to the extent of paying the duty on the fifty machines, which will be small, rather than have the privilege revoked. A more careful watch is to be kept hereafter on those who take bicycles across the border as tourists, their names and League numbers being recorded so that they cannot take a second machine into Canada until the first is brought back.

**ELEVATED CYCLE PATH**

**Work on Nine-Mile Wood Structure from Pasadena to Los Angeles to Begin At Once.**

A company has been organized in California for the purpose of constructing an elevated roadway from Pasadena to Los Angeles exclusively for the use of cycles and motor carriages. It will extend for a distance of nine miles through a charming country, by oak-dotted hills, through orange and lemon groves, through narrow valleys and broad streets in the most direct route possible, at an easy grade of one per cent. The way is to be elevated sixteen feet above the level of the streets, though it is sometimes fifty feet above the valleys.

The right of way, with the exception of two miles, has been purchased, and arrangements are being made for a terminal depot at Pasadena. The Los Angeles terminus will be on the plaza. Midway between the two cities, on a hill, 200 feet above the river bed, will be erected a casino and cyclists' club house, where open air concerts will be given and a cafe established.

In the center of the cycle path will be a three-inch rail to prevent collisions of cyclists going in opposite directions. Entrance and exit will be controlled by toll gates, and the sum of ten cents will be charged for the use of the path for the round trip. Work is to be begun immediately on the first six miles.

The projected cycleway will be ten feet wide and allow plenty of floor room for four riders abreast; the side rails—of base board and wire netting—will be five feet high, affording ample protection against accidents, yet allowing full view of the country; the floor itself will be of Oregon pine, an inch and a half thick; and great care will be taken to place the structure upon strong and well braced supports. The posts will all be charred at the base and filled in with cement, to protect them from decay and the entire structure will be painted dark green. When it is brilliantly lighted from end to end by incandescent lamps placed two hundred feet apart over the center of the wheeling space, a trip over it at night will be a treat new to cyclists.

In India the natives are often seen riding bicycles fitted with rat-trap pedals, which they push with their unprotected feet. From lifelong exposure and use on all kinds of ground the soles of their bare feet become toughened and insensible to ordinary pricks and scratches.

Tires of German military bicycles are reported to be made with an ordinary outer cover enclosing another tire, the lower half of which is of soft, spongy rubber, while the half nearer the rim is composed of solid segments of cork which are severed transversely at places.

**NEW CYCLE REPAIR CHARGES**

**ADOPTED BY COLUMBUS AGENTS**

**First Attempt to Establish Uniform Prices for Repairs—Dealers Take Kindly to It.**

Columbus, O., Feb. 20.—The appended list of prices on bicycle repairs has just been adopted by the dealers' association of this city. It is, of course, a little too early to predict what results will follow the establishment of this list, particularly as no efforts of a similar character have been attempted or tested here before. The dealers, however, have been so unanimous in their action upon all subjects looking to the betterment of all retail trade conditions that it is confidently expected the schedule of prices will be closely adhered to. Every effort will be bent to persuade the repairmen that it is also to their advantage to maintain the prices herewith quoted:

Frames cut down and re-enameled, plain colors, wheel brought knocked down .....	\$5.00
Re-enameled, plain colors, knocked down .....	2.50
Re-enameled, plain colors and striped .....	3.50
Re-enameled, fancy colors and striped .....	5.00
Taking wheel apart and putting together, extra .....	1.00
General overhauling, bearings only ..	1.00
General overhauling, bearings and cleaning nickel .....	1.50
Truing and aligning frame.....	\$1.50 to 2.00
Truing and aligning forks.....	.50 to 1.00
Spokes, one .....	.25
Spokes, two .....	.35
Each additional put in.....	.10
New rims put on, plain.....	2.00
Pair rims put on, plain.....	3.50
G. & J. rims put on, each.....	2.50
Truing wheel in frame (fair condition).....	.25 up
Truing wheel in frame (bad condition) ..	.50 up
Punctures double tube, laced tires....	.50
Single tubes, one plug .....	.25
Single tubes, two plugs.....	.50
Jiffy or Vimoid, each hole.....	.25
Clincher tires .....	.35
M. & W. valve and stem.....	.50
Cement on tire .....	.25
Vulcanizing, casing and repairing tube, small hole .....	.75
Vulcanizing, casing and repairing tube, large hole.....	1.00
Vulcanizing end of inner tube, removed and replaced .....	.50
Vulcanizing valve stem, single tube...	.75
Straighten crank .....	.25
Straighten handle bar .....	.25 up
Truing sprocket .....	.25 up
Cleaning bearings .....	1.00
Vulcanizing single tube, small hole...	.50
Vulcanizing single tube, large hole....	.75
General overhauling .....	1.50
Cleaning spokes and varnish and enamel rims, per pair.....	1.00 up
Chain guard complete and lacing.....	1.00
Dress guard, complete .....	1.00
Lacing mud guard .....	.50
Lacing chain guard .....	.25
Put on rear stays .....	.50
Pedal rubber put on.....	.40
Repair chain .....	.25

**Acetylene Gas for Lighting Stores.**

What is the cheapest way to illuminate a store?

This question was discussed in a meeting of dealers one day last week, when it was stated that new methods of illuminating were coming up which might be used to advantage. One man said he had some experience with acetylene gas, finding it satisfactory. He had trouble at first, but learned how to operate it and now liked it very much. Electric light in his store had cost him \$3.95 per month for six lights. He now has twelve acetylene gas lights, which cost him \$4 per month or about the same, but he gets at least one-third more light and has it for use at all times of the day, whereas electric light was not furnished in the morning when probably it would be necessary to have light if the day was very cloudy, or on winter mornings when days are short.

Thirty-inch wheels are becoming popular in France.

# CRESCENT Bicycles

## at the Crest of Favor.

High Grade and  
Low Price tell the  
Story for 1899.

In '95 we talked a good deal about the Crescent Bicycle.  
Sold 57,000 that year.

In '96 the Crescent spoke for itself on thousands of American roads.  
Sold 70,000 that year.

In '97 every Crescent rider was talking about the wheel to everybody else.  
Sold 83,000 that year.

In '98 we told what the Crescent was, what the Crescent did, and what Crescent riders said.  
Sold over 100,000 that year.

# MILWAUKEE TIRES

## PUNCTURE PROOF

Pneumatic

Resilient

Single Tube

Easy Riding

COPYRIGHT 1888, BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.

PRESENTING TESTIMONIALS.

HUNTINGTON, W. VA., Dec. 1, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen:—It affords me much pleasure to give you a testimonial of your Milwaukee Patent Puncture-Proof Tires. I have been using your puncture-proof tire for some time and consider it THE BEST TIRE I ever saw, notwithstanding the fact I have ridden some of the best tires on the market including the Palmer. Respectfully, (Signed) W. F. BOWEN.

THE ERNST WAGNER COMPANY,  
Wholesale and Retail Hardware and Bicycles.

MANITOWOC, Wis., Nov. 22, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen:—I have used one of your tires on my own wheel, and I do honestly believe it to be the BEST TIRE made to-day. (Signed) E. WAGNER.

Representatives Wanted. Write for Prices and Other Information.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS., U. S. A.

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.  
ALL remittances should be made to THE CYCLE AGE COMPANY.

## LOCAL CYCLE PUBLICITY

The disbandment of the National Board of Trade of Cycle Manufacturers has apparently created a very widespread impression to the effect that hereafter all organized work within the cycle trade must be considered hopeless. It was the signal for a go-as-you-please policy diametrically opposed to the previous policy of central regulation and may have affected the enterprise and vitality of several local cycle boards of trade.

In reality the National board fell because it failed to regulate or regulated too harshly, and not because it regulated too much. It died through internal disagreement, because the interests of its members and those of the trade at large clashed. In the beginning of its existence it organized about forty local boards of trade and these are continuing after the parent body's disruption. For the cycle dealers who compose these local organizations to lag in their work would undoubtedly be a mistake. They possess the vital principle which the national board lacked, namely identity of interests of the members. And they have a hundred and one ways of accomplishing good results in all towns not exceeding, say, 150,000 inhabitants.

It has never been the hidebound local organizations that wanted to regulate everything which thrived; but much good work has been done by local boards whose members came together at short intervals and after talking things over agreed upon certain informal rules for conducting their business.

In the past year such boards have found it possible, for example, to suppress all donations of cycle sundries with the sale of bicycles, and by this alone have saved their members several hundred dollars apiece. They have also found it practicable to maintain reasonable prices for repairs by keeping the same within the limits of two schedules, one giving the maximum price that the public should be expected to pay and another the minimum price for the dealer or repairman to accept.

Besides other forms of work, which may be best prosecuted by local cycle boards in conjunction with other branches of trade in a community, the regulation of local publicity for cycle matters presents an attractive field for energetic cycle dealers. Many newspapers in the minor towns have been in the habit of casting slurs upon the cycle trade and echoing every rumor of low prices, etc., without giving heed to the harmful effect to local trade of so doing and without investigating at all if the rumors were well founded. Their desire for printing matters pertaining to cycling should be turned in another direction; and it is easily within the power of local cycle boards to do so by furnishing reading matter which will stimulate the public interest in cycling instead of holding it back. It may be obtained from cycle trade papers in this country and England and from journals devoted to outdoor sports. Manufacturers may also be laid under contribution to supply it.

In local advertising the boards may assist their members by contracting in block for the season's work, obtaining not only lower rates but impressing the publishers with the necessity of catering to the trade by good composition and press work and open-handed hospitality for cycling news of reliable character and general interest.

Since it is being gradually acknowledged that the hardware man or the jeweler or the farm implement dealer who also sells bicycles, will make his advertising much more effective if he does not mix his goods in his announcements but advertises bicycles separately from other lines, it should

be comparatively easy to induce members of local boards to appropriate a certain sum for cycle advertising at the beginning of the season and invariably hand their advertisements to the publishers through the secretary of the board.

The saving would be instantaneous; the ultimate effects to encourage cycling in the many social forms of the pastime which have not yet been much cultivated, would be incalculable if the practice of supplying good reading matter became general.

## EXPRESS COMPANIES YIELDING

All the bicycle dealers and other merchants who during the last few months have expressed their opinions in regard to express rates and the means for regulating them in communications to this paper may feel that they have contributed their share toward bringing about a reform which the defunct National board of the cycle trade proved powerless to cope with. The Merchants' Association of New York which led the crusade against unjust express charges has ordered a truce pending negotiations with the express companies looking toward an amicable agreement.

This is probably the first time in the last three decades that the express companies have found it politic to keep their ear to the ground and listen to an argument in favor of reducing their income, and while the communications to this paper alone would have been without effect to bring about this first step toward a betterment of conditions, they have proved valuable material of war in conjunction with the ammunition furnished by other trades and by the New York association.

"In case agreement by negotiation cannot be reached," says the latter, "we shall resume with vigor our efforts to have express charges regulated by law." From this statement it may be surmised that the Merchants' Association will try to give the negotiations now pending a national scope so that the entire cycle trade will share the benefits of whatever amicable agreement the association sees fit to enter into. Doubt might be entertained on this point, because it is the avowed object of the combined merchants of New York "To foster the trade and welfare of New York" and not of any other part of the country unless incidentally.

In this instance the grievance is national, however, and a local remedy would not prove effectual or lasting or lawful.

Whatever inducements the express companies may hold out to the association in regard to express rates from and to New York, the association will not fail to see that it would cripple itself for all future work of any magnitude by taking a local view of a matter in which it has received aid from all over the country.

To the cycle trade the satisfactory progress which has so far been made points unmistakably to a new conception of the proper means for redressing troubles in the trade. In the past it has been attempted to do so through organizations within the cycle trade only and the results have not been flattering when dealing with large issues. Now the cue has been given for a more comprehensive method by which the cooperation of other trades should be enlisted, whenever their interests are identical with those of the cycle trade.

For local efforts as well as for those of national scope this means the hearty participation of cycle manufacturers, cycle jobbers and retailers in public movements which have a bearing upon their own prosperity.

\* \* \* \*

More than one concern now exclusively engaged in cycle manufacture is restlessly scanning the horizon for a sign which may be interpreted as a happy augury for the future. Three years of savage competition attended by countless follies and hardships has resulted in such a thinning of hopes that even the bravest recoil from considering the further stages of a strife which must leave the field eventually in possession of those who are best fitted to survive.

\* \* \* \*

Exclusive bicycle makers want side lines as badly as exclusive dealers, but do not desire to pick up with manufacture which will be as burdensome as that which they now carry on.

## BRAZING BY IMMERSION

### Frame Brazing Cost Largely Reduced By Anti-Flux—Experiments in the Hoffman Factory

The use of anti-flux for preventing the accumulation of brass on the outside of frame connections during the brazing process promises to be one of the most important operations tending toward the general adoption and economical practice of immersion brazing. Nearly every shopman who is thoroughly familiar with the dipping process concedes that the operator of the immersion furnace can braze more frames in a day, braze them more uniformly secure and with the consumption of less fuel than can the operator of the flame brazing table. The riddance of superfluous spelter is a problem which deserves much attention from experimenters because it is at present the point in immersion brazing which entails the most expense.

#### Filing is Expensive.

Though there are several improved methods for economically removing brass none has shown sufficient practicability to warrant the dropping of the long standing plan of filing. Pickling baths and emery belts have been only partial successes and each is open to severe objections. The bulk of the factories still file, and though the filing of a frame brazed by dipping is but little if any more difficult than the filing of a flame brazed frame the general desire for economy in this branch of cycle building which the dip process has stimulated makes the money spent in filing frames seem like a sheer waste.

The very fact that the brass that is filed off a frame joint is in no way necessary, and the further fact that the expense gone to in order to remove it is caused by the shortcoming of brazing methods, make it obvious that the best reduction of frame finishing costs is not through improved methods of spelter removal, but through practical prevention

unable to obtain satisfactory results from the preparations that have been known. The popular recognition of the fact that immense savings could be made by the use of a successful anti-flux has led to individual experimenting in various factories, and several superintendents and brazing foremen are now almost satisfied that they have compositions which will meet the requirements.

#### Anti-Flux Reduces Expense Two-Thirds.

Where a brazing furnace is installed and operated successfully, the cost of brazing per frame should not amount to more than 4 cents and the spelter used should not exceed 5 cents' worth, making a total brazing cost of 9 cents per frame. Systematic practice can doubtless lower these figures to 6 or 7 cents. Now if the frames be subjected to a sand blast before sending to the filers an additional expense of 4 cents each is added, and as an average on regular frames the filing will cost 35 cents per frame. This means that while doing 4 cents' worth of work and using a few cents' worth of spelter, the brazer has made necessary, because of the accumulation of brass on the outside of the joints, work amounting to 39 cents or a little over four times as much as the entire original expense of brazing.

Supposing that a perfect anti-flux were used in connection with the immersion brazing, the cost of spelter consumed would be reduced one-half or more, say to 2 cents per frame. Letting the actual cost of brazing remain at 4 cents, the total cost of brazing would be reduced at the start to 6 cents per frame, and there being but little brass on the outside of the joints the bulk of the usual filing work would be unnecessary. Adding 4 cents for sand blasting and 5 cents for what filing and emery cloth polishing would be needed the frames could be turned over to the enameling room for about 15 cents each. This figure in comparison with the average cost of brazing by the flame process and removing the accumulated spelter by filing, which altogether brings the expense up to about 53 cents, shows very clearly the advantages that are to be gained through the immersion process when once the right composition is found to use as an anti-flux.

#### A Successful Anti-Flux.

In the factory of the Hoffman Bicycle Co., of Cleveland, where the dipping method is regularly employed, an anti-flux is in use which yields the results shown in accompanying illustrations. The brass left on the outside of the steering head shown is practically limited to the portions in the immediate vicinity of the joint where it was necessary to leave the metal uncovered by anti-flux in order to insure perfect flow of metal into the joint. The cost of removing what spelter there is on the outside of the joint should not, after sand blasting, amount to more than 15 cents per frame, giving a probable total cost of brazing and finishing the frames ready for the enameling room of about 24 or 25 cents.

The left of the two straight tubes in the second illustration was painted with the Hoffman anti-flux and dipped in the brazing crucible as though it were a joint to be brazed. The only brass adhering to the outside of the tube was a light ring around the tube at the point

which marked the depth to which it was dipped and a few very small lumps scattered around the end of the piece. The other tube had before dipping been painted with an anti-flux which is on the market for general use. Either from the action of flux in the crucible, or on account of the heat, or because of both, the anti-flux only partially succeeded in keeping the brass from the tube, there being several large spots thinly coated with the spelter. After the dipping the anti-flux coating appeared in a striated condition and was as hard as a borax scale, thus making necessary either extra work for the filer, sand blasting or pickling.

#### Preparation of Anti-Flux.

Graphite has been the base of all anti-flux preparations made thus far on account of its heat resisting properties. It

THE CYCLE AGE

GOOD AND BAD RESULTS.

is not known if late experimenters with anti-flux are using graphite, though from the appearance of the coating left on samples of work it is probable that the compositions contain some graphite. One of the earliest forms of anti-flux consisted of equal parts of rust or ferric-oxide, graphite and whiting or calcium carbonate, mixed with enough turpentine to give the composition a pasty consistency. Then in order to supply the necessary body for painting purposes varnish was added. Similar mixtures have been thinned with water, linseed oil and even stale beer, the exact nature of the mixing liquid seeming not to matter except as it furnished a good paint. Whether the oil used should be of a mineral rather than of a vegetable nature is not known. In fact so open are the various questions concerning the mixing of such preparations, the exact utility each of the various substances incorporated in them, that there is plenty of room for the intelligent experimenter.

#### Mineral Paint Can Be Used.

Thick bodied creosote paint, or any form of mineral paint such as is used by railway companies for painting property subject to exposure, gives fair results as a preventive of superfluous spelter. Such material has been used in a few instances

THIS PIECE WAS ANTI-FLUXED.

of superfluous spelter. For this reason, then, anti-flux becomes an important item in immersion brazing. Though anti-flux was proposed almost as early as was the dipping process it has never been widely adopted because brazers have been

by flame brazers who brushed it over the joints, covering all of the outside surface except that portion immediately around the joint into which the brass had to be flowed. If it should prove a satisfactory anti-flux for immersion brazing its advantage of being quite cheap and readily obtainable would count much in its favor.

One of the latest attempts at the production of a new anti-flux compound is that of a Chicago manufacturer who states that he has a very successful preparation, but that it demands the use of a specially constructed furnace. All of the successful immersion furnaces now in operation are arranged so that the flame and heat rising from the fire box are deflected to pass over the top of the crucible and keep the surface spelter at the proper temperature. This experimenter's anti-flux while it stands the heat of the brazing furnace will not stand direct contact with the flames, and so to use it successfully a furnace must be constructed in which there are no flames covering the crucible. How well this can be done is a matter of conjecture, but it certainly opens up a field for careful study on the part of furnace builders. If a furnace could be built in which the flames were confined and not allowed to pass over the top of the spelter, and which would still heat the brass at the top as well as at the bottom of the crucible, it would have the added advantage of affording much more comfortable operation than do the furnaces as now ordinarily built.

**FAVORS IMMERSION BRAZING**

**Hofman Bicycle Co. Finds the Process Satisfactory and More Reliable Than Flame Brazing.**

The following letter received from the Hoffman Bicycle Co. is good evidence of the fact that when intelligently operated the dip brazing process has many points of superiority over the old flame method. It particularly brings out the fact that not until the immersion process was adopted were manufacturers able to successfully braze fish mouth reinforcements or internal lug branches. The Hoffman Co. strikes a true note in its remarks about the fitting of joints and the impossibility of brazing poorly fitting joints by the immersion process.

To the Editor:—Having had considerable experience in dip brazing, we beg to say that in our judgment it is preferable to the old style of brazing. Up to the present season we used the old blow pipe process. We found in many instances that it was difficult to braze fast fish mouth reinforcements with this process. The difficulty was to get the spelter to run evenly all around and to make sure it was brazed, as we were unable to see on the inside of the tube. We find with the new process, properly handled, it is an easy matter to braze fast a fish mouth reinforcement, or any sort of internal joint.

To illustrate the fact that such brazing can be handled perfectly, we are sending you under separate cover one of our regular bicycle heads, onto which we have brazed a short section of tubing such as we use in the construction of our bicycles, which we have sawed open to prove that dip brazing can be done successfully. We ask you to criticize this joint and find any fault you may be able to with it.

The trouble seems to be that a great many people criticize a certain line of work before they are familiar with it. In the first place, to braze with this process successfully it is necessary to have the right kind of apparatus, and in the second place it is necessary to know when the work is right. We have no difficulty in brazing with the dip process. We have overcome all obstacles in this line and have a perfect system, whereby the brazing can be done with absolute certainty. Regarding burning the tubing, would say that in our judgment the tubing is not so liable to be burned as by the old process, as the old process of brazing usually heated the tubing hotter on one side than the other, and sometimes it was necessary to get an excessive heat in order to get the spelter to flow evenly all around, and then there was no certainty that the joint was brazed. With the new process the spelter can be made to flow evenly, and at the same time the tubing heated evenly all over and it is not necessary to get the tubing so hot it will burn the carbon out.

Regarding the joints having to be made perfect, would state it has always been our policy to make perfect fitting joints, and a joint that is not perfect enough to braze with the dip process is not perfect enough to put into a bicycle, as it not only makes poor and defective construction but it endangers the life of the rider, which is certainly the most important feature of the lot. Owing to the sharp competition many manufacturers, in their efforts to make their goods at low cost, disregard many important features that should be attended to.

If the heads of all manufacturing concerns were mechanics, and would look into the construction themselves more carefully, in our judgment there would be a tendency to make a better class of goods, which would command better prices. The public is willing to pay for a good article providing they are sure of getting a good article, but competition has been so sharp that each one is trying to beat the other in price, and the result is that bicycles are being made today, and sold at ridiculous prices, which are not only unsafe but which are a disgrace to the bicycle business. In our judgment the time is near at hand when better construction will have to be made, and we hope this time will arrive very soon.

HOFFMAN BICYCLE CO.

**Susan Van Doozen.**

I'll write, for I'm witty, a popular ditty,  
To bring to me shekels and fame,  
And the only right way one can write one today  
Is to give it some Irish girl's name;  
There's "Rosy O'Grady," that sweet "steady lady,"  
And dear "Annie Rooney," and such,  
But mine shall be nearly original, really,  
For "Susan Van Doozen" is Dutch.

"Oh! Susan Van Doozen, the girl of my choos'n',  
You stick in my bosom like glue,  
When this you're perus'n' remember I'm mus'n'  
Sweet Susan Van Doozen, on you;  
So don't be abus'n' my offer, and bruise'n'  
A heart that is willing to woo,  
And please be excus'n', not cold and refus'n',  
Oh! Susan Van Doozen, please do!"

Now, through it I'll scatter—a quite easy matter—  
The lines that we all of us know,  
How "the neighbors all cry as she passes them by,  
"There's Susan the pride of the row!"  
And something like "daisy" and "setting me crazy"—  
These lines the dear public would miss—  
Then chuck a "sweetheart" in, and "never to part" in  
And end with a chorus like this:

"Oh! Susan Van Doozen, before I'd be los'n'  
One glance from your eyes of sky blue,  
I vow I'd stop us'n' tobacco and booz'n'—  
That word is not nice, it is true—  
I wear out my shoes 'n', I'm los'n' my roos'n'—  
My reason, I should say, dear Sue—  
So please change your views 'n', become my own Susan,  
Oh! Susan Van Doozen, please do!"  
—L. A. W. Bulletin.

**SPEED ON HILLS**

**Keeping the Effort Constant—Overexertion Avoided by Proper Regulation—Effects of Wind.**

Experienced riders well know that a constant amount of exertion in riding is less fatiguing than intermittent bursts of speed efforts alternating with periods of relaxation. It would seem, therefore, that it would conduce to ease in cycling if one were careful to exert himself just as much going up a slight slope as down one, and, of course, he could do this by properly adjusting his speed, according to the deductions of an English professor from some experiments to determine the air resistance to cyclists. Thus, supposing one's usual rate of riding to be about 12 miles per hour, then if he comes to a hill whose flanks slope at 1 in 60 the proper pace to ride up the hill would be 4 miles an hour, and 20 miles per hour down the opposite side; this would provide for the same exertion going up or down; similarly, if the slope be 1 in 120, the speed up is 8 miles per hour, and the speed down is 16 miles per hour.

When a rider is going very fast, as in going for a record on the road, he should pay far less regard to the hills and ride

more as if they never existed; in fact, while for ordinary riding a hill of 1 in 80 changes a speed of, say, 12 miles an hour (on the level) to 6 miles an hour up the hill, and 18 miles an hour down it, yet for a racing pace of, say, 20 miles per hour that same hill will only change the pace (for equal exertion uphill and down) from 20 miles an hour (along the level) to 16 miles an hour up the hill, and 24 miles an hour down. So that the variation in speed is only 8 miles per hour, or 40 per cent in the last case, while in the first case the variation was 12 miles per hour, or 100 per cent.

As an example of the effect of wind other than that caused by one's own motion, first take the case of riding on a straight road at 12 miles per hour with the wind dead against one. If the velocity of the wind (relative to the road) be 8 miles per hour, the effect on the cyclist is as though he were climbing a hill of 1 in 60 all the time, and if the velocity of the wind increases to twenty miles per hour it is as if the cyclist were climbing a slope of 1 in 20—a good stiff hill.

Now take the far preferable case of the cyclist having the wind with him. If the velocity of the wind be 8 miles per hour it helps him as though the road sloped downhill at an incline of 1 in 120; should the wind become a brisk breeze of 20 miles per hour the apparent downhill slope becomes 1 in 80, and, lastly, if the wind become a small gale of 40 miles per hour the cyclist feels as if the slope were 1 in 20, and as that is inconveniently steep it would necessitate using a brake.

**English Exports for Three Weeks.**

Exports of bicycles, materials and sundries from all the ports of England for three weeks ending Feb. 3 are recorded as follows:

Perth, Australia . . . . .	\$ 3,785
Rockhampton . . . . .	963
Adelaide . . . . .	842

## LIABILITY OF MAKERS

### Important Decision in English Court Concerning the Protection Granted By the Guarantee

In a recent issue of the Cycle Age attention was drawn to the liability of bicycle makers if it should happen that their machines should break down through defect in structure while in possession of riders to whom the usual guarantee had been given. It was pointed out that the guarantee as it now stands is no guarantee against a lawsuit for heavy damages.

In one of the English courts a case has just come to notice in which verification of the risk which attends defective cycle manufacture has come prominently into view, and the maker who was unfortunate enough to be accused was mulcted in the sum of \$600 damages by a jury which were given no alternative in the matter of conclusion by the judge who tried the case. The case is one of more than usual interest for bicycle makers in this country, not alone on account of the fact that the same common law practice which obtains in England would by inference obtain in this country were a similar case carried to the higher courts, but on account of the fact that so many of our bicycle makers are sellers of goods in England.

#### Origin of the Suit.

An outline of the case is here given: An Irishman bought a bicycle from the Belfast agent of the makers of the Rover. He did not purchase the machine outright, but paid \$52.50 for it in exchange with a second-hand mount. Some months after the purchase he went to England and had the machine sent to his place of residence. One evening while riding at the residence of his employer the machine collapsed and the rider was rendered unconscious, in which condition he remained for four days. The damaged machine was sent to the factory with a polite note stating the particulars of the accident, and requesting that it be inspected and the plaintiff's claim for \$100, incurred through doctor's bills, be allowed. The makers of the machine, however, stood on their dignity and declined to do anything more than make good the parts which proved defective, which happened to be the front forks, but intimated their willingness to supply a new frame. These overtures were not accepted by the cyclist, and as a result he instituted a suit for \$2,500 damages.

#### Makers Stand Pat on Their Guarantee.

In responding to the letter of the injured cyclist, the makers of the machine stated that while the accident was a regrettable one, still they would not go beyond the guarantee contained in their printed catalogue, as they could not tell what abuse the machine might have had after it left their establishment. The attorney for the plaintiff, seizing upon this valuable point, established the fact that the machine had been traded or sold by the agent of the maker while represented as in fit condition to ride. In detail it was shown that the injured cyclist went to the agent's store, was given a catalogue of the Rover company and told that if he wanted a strong and reliable machine which would stand knocking about he should purchase the Rover. The plaintiff stated to the agent that he had heard of Rover machines breaking at the head, but the agent lightly told him not to place

credence in all that he heard. The cyclist took the catalogue home, devoured its contents and made up his mind to purchase a Rover.

The machine was used for six months, and then after an intermission of three months was shipped to England, where it was used for a month in daily trips of six miles each. One night while traveling at the rate of about ten miles an hour the steering post of the machine broke just above the crown, and when the rider recovered consciousness he found himself with the palate of his mouth broken, one tooth knocked out, others loosened, one of his lips cut, his face badly lacerated, and his body generally in as fit a condition for repair as his machine. It was testified that while riding the cyclist encountered no obstacle.

#### Bill for Doctor's Services Disallowed.

A claim of \$6 for spectacles, which doctor ordered, was not allowed the cyclist by the makers of the Rover, and then he pressed a further claim for a larger bill of expenses which, upon disallowance, resulted in the suit.

It was contended by the injured cyclist that the damaged machine was not reinforced in the steering post, a structural condition which, however, was found in the machine which was returned to him repaired. Through the assistance of various witnesses the injured cyclist proved that he was a very careful rider and that the machine did not show any signs of collision—in fact, that the bottom of the steering post was snapped clean off.

#### Defense of the Makers.

Upon presentation of all the evidence on both sides, the solicitor for the plaintiff urged the court to toss aside the value of the specific guarantee given by the makers in the catalogue. The attorneys for the defendant company urged that the onus of proving that the machine was not all that their clients guaranteed rested with the plaintiff, arguing that if the injured cyclist was successful in his action no cycle maker would be safe, and that commerce in cycle manufacture would be paralyzed. The defendants further pleaded through their counsel that they had guaranteed all precautions which were usual and reasonable had been taken by them to secure excellence in material and workmanship, and if the machine met with an accident it was not through neglect on their part. In a final effort to persuade the jury that no fault could be implied to the makers of the machine, it was declared that no evidence had been offered to show that the machine was constructed of bad material or by unskillful workmen; that the plaintiff bought a specified article under its trade name and obtained a receipt showing that it was a specified article; that, in short, there was no real contract between the injured cyclist and the maker or his agent.

#### An Unsympathetic Judge.

The judge, however, was disinclined to be sympathetic with the makers. He rejected as mere rumor that part of the evidence of the plaintiff which tended to prove that it was common for Rover machines to break at the head; summed up the evidence in the case and put the following significant questions to the jury,

which were answered in the manner indicated:

1. Did the plaintiff at the time of the sale make known to the defendants' agent, Mr. Gass, the particular purpose for which it was required, so as to show he relied on his skill and judgment?  
Answer: Yes.
2. Was the contract for the sale of the bicycle to the plaintiff in fact a contract for the sale of a specified article under its trade name?  
Answer: No.
3. Was there an examination by the plaintiff at the time of sale, which ought to have revealed any defect in the steering post, if it existed?  
Answer: No.
4. Was Mr. Gass agent for the sale of the bicycle to the plaintiff?  
Answer: Yes.
5. Did he represent to the plaintiff that the bicycle was then reasonably fit, and proper to ride?  
Answer: Yes.
6. If so, was the plaintiff thereby induced to buy it?  
Answer: Yes.
7. Was the bicycle then reasonably fit and proper to be used by the plaintiff?  
Answer: No.
8. If not, did it, by reason of its not having been sold reasonably fit and proper to be used, break down when used in April, 1898?  
Answer: Yes.
9. Before the sale, had all usual and reasonable precautions been taken by the defendants to secure excellence of workmanship and material in respect to the bicycle?  
Answer: No.
10. If not, did it by reason of such usual and reasonable precautions not having been taken break down?  
Answer: Yes.
11. Did the plaintiff sustain loss and injury by the breaking of the bicycle?  
Answer: Yes.
12. If so, assess his damages for the loss and injury he so sustained.  
Answer: £120 damages.

#### An Important Question.

It may be added that the jury found considerable difficulty in answering the second of the judge's questions. From a legal point of view it was the most important of the series, and had it been answered in the affirmative, judgment would have been entered in favor of the company, as the sale of a specified article under its trade name does not carry any implied guarantee.

The Cycle Manufacturers' Protective Association, which is the English trade organization which in function corresponds to the National Board of Trade of Cycle Manufacturers in this country, is deeply interested in the decision and in another like case which is pending. It is not the guarantee as it is printed in the catalogue of makers which is the center around which the legal battle is being waged, for that is a matter which has been settled out of court before this. But the paramount issue is, does this trade guarantee set aside the guarantee which is implied by common law?

#### Gutter Rights of Bicycles.

An English judge has decided that a bicycle standing in the gutter, propped up by the pedal on the curbstone, is entitled to protection from other users of the public street. Some overhanging wire in a passing cart pulled a bicycle under the wheels of the vehicle by catching the handle bar and the cyclist got his damages in court. Counsel pleaded that the cyclist left it at his own risk, and the accident was the result of his own negligence. Thereupon the judge pulled up counsel sharply and told him he was against the argument.

An important exhibition of motor vehicles is soon to be held in Verona, Italy, whose city council is now considering the programme for the occasion. It is proposed to hold there the first congress of Italian motor vehicle drivers, to have a promenade of vehicles through the city, a general display of the various automobiles and a road race of 103 miles.

# To the Trade

**T**HE American Saddle Co. begs to announce that its organization has been completed, and that its general offices are located in the American Trust Building, Cleveland, Ohio.

The American Saddle Co. has acquired the properties and business of the following named companies:

THE GARFORD MFG. CO., Elyria, Ohio  
THE WHEELER SADDLE CO., Detroit, Mich.  
THE WHEELER SADDLE CO., Toronto, Ont.  
THE GILLIAM MFG. CO., Canton, Ohio.  
THE HUNT MFG. CO., Westboro, Mass.  
THE P. & F. MFG. CO., Reading, Pa.  
and a controlling stock interest in the  
BROWN SADDLE CO., Elyria, Ohio.

The primary purpose of the new organization is to arrest the calamitous conditions which have governed the saddle industry for the past two seasons, and which have deprived the makers of fair returns on their capital invested.

This it will strive to accomplish, not by the advancement in price of its product to the trade, but by the reduction of expenses and the cost of manufacture through concentrated management of its business and the employment in its several mills of the best special machinery and mechanical appliances known in the art of saddle building.

It will constantly endeavor to better the grade of its product, and by increased facilities extend better service than has heretofore been possible.

All communications should be addressed to the company at Cleveland, Ohio.

## The American Saddle Company

By A. L. GARFORD, President.

## LETTER FROM ENGLAND

### Common Misapprehensions in Regard to British Forms of Manufacture—Fine Work on Components

From force of habit and through constant repetition of rash statements in that part of the press which knows nothing of the condition of the bicycle industry in any country, it has become too broadly accepted that American bicycle manufacturers are far in the lead of all foreign competitors in everything that pertains to the art of bicycle production. That the assertion is true in a measure has prevented those who knew the exact conditions on both sides of the Atlantic from gainsaying it, for the public are impatient of fine distinctions and favor unmeasured expressions of opinion if they may be only half-way defended.

#### Reasonable Foreign Opinions of Value.

In many instances American manufacturers have not found out the real nature of the competition which they would meet in the export markets until they had entered them and been brought face to face with foreign productions. They did not, then, as a rule, find that the obstacles to successful trade were insurmountable but only that they would have been gainers if they had listened less to the colored reports which found their way into the majority of our press and more to the sober accounts given in *Cycle Referee* of London, and from time to time in *The Cycle Age*. Such views as are entertained by unbiased members of the English or German industry have seldom been presented, and the *Cycle Age* therefore takes pleasure in publishing a letter from such a source, accompanying it with illustrations of the two crank hanger constructions to which the writer refers, one being that of the Birmingham Small Arms Company shown with the rear fork construction in which it is incorporated, and the other that of another company which also manufactures component parts for the agents' trade:

#### A Young School of Mechanics.

London, Jan. 30.—Taking a line from the usual expressions in American bicycle journals, it might be imagined that the impression in America is that manufacturers in this country are little removed from primeval savages, and that our output in bicycles and bicycle parts is of a nature both cumbersome and inartistic, as well as unmechanical.

It is willingly admitted that, speaking broadly, our manufacturing methods are very expensive, and that our shop economics are not as advanced as in America. The principal reason for this state of things is the absolute disregard which in the past has been shown towards men of technical and educational standing. Our elementary education has been crude, and not followed up by any technical instruction either in the matter of theoretic or applied mechanics. This state of things is fortunately being amended, and there is already a young school of mechanics who are very little behind American thought. Despite, however, the fact the general standard of education has been low, there has always existed a school of engineers capable of exercising a very wide influence upon manufactured products. This fact, combined with the free trade policy adopted in our markets, which brings competition from all parts of the world, has produced an output of a character that is far more advanced

than most Americans give us credit for. Put briefly, the prevailing sentiment in the mind of an English designer is a distinct fondness for true radii and true angles. This trait will be found in practically every branch of engineering construction. It will be conveyed most vividly by comparison of some of our locomotives with those of American type.

#### Light Weight English Bicycles.

I now wish to show you the effect which this tendency has produced in bicycle design. In the first place, I wish you to dis-illusion yourself of any idea that the English bicycle is necessarily a heavy machine. As a matter of fact, all of our factories produce light bicycles, which could always compete in point of weight against American products, even at the time when American houses were advertising road machines at from 18 to 25 pounds. The difficulty, however, is that English manufacturers have not yet learned to specialize products, and it is usual for many different models to be going through the factory at the same time. An English bicycle catalogue will usually contain a path racing machine, weighing

B. S. A. HANGER AND FORKS.

anywhere from 19 to 24 pounds, according to the idiosyncrasy of the designer. There will also be a road racing machine, which will be practically the same as the path racing machine excepting that there will be a wider range of adjustment to handle bars and seat pillar, and that the wheels and tires will be somewhat heavier. The weight of this machine will be approximately 23 to 25 pounds. The next model will be a light roadster. This machine is in every respect identical with the American full roadster, and will weigh from 24 to 28 pounds. The next model is a full roadster. This machine is believed to be peculiar to this country. It is built from entirely different requirements to those existing in your country. It is a machine which is intended to last many years, and is used by business men and tourists. I understand that a very large proportion of the year's output of American bicycles is bought by people who ride mainly in the parks and cities. It is quite the reverse in this country, where the full roadster bicycle to which I allude is used and bought by people who ride the length and breadth of the country over. It is provided with an entirely different equipment from that associated with American machines. The mud guards in themselves are light, usually beaded in order to give lateral rigidity. They are, however, attached to the machine in a vastly superior manner to that usually associated with your own fittings. The stays, bridges, etc., are usually machined fittings, and although they may be removed without interfering with the

usual adjustments of the machine, they possess sufficient solidity to render them a permanent adjunct to the bicycle. A gear case is usually provided, and the brake work is also of an efficient mechanical nature.

#### Bottom Brackets for Assemblers.

Having superficially referred to the conditions prevailing here, I will direct your attention to the samples which are now in your possession.

I will first consider the bottom bracket and accompanying fittings comprising the chain stay, chain, etc., manufactured by the B. S. A. Co., which I have sent. You will at once see, from even a cursory examination, that these fittings are made for the market entirely different from your own. So far as I can judge, most American parts makers, such as the Cleveland Machine Screw Co., Smiths of Milwaukee, Crosby & Mayer, Fauber and others, supply their products to factory manufacturers possessing a considerable output of complete machines. This is quite the reverse of the usual practice in this country. Here a bicycle factory is to all intents and purposes self-contained. The people who buy components are agent makers or "assemblers." They build in quantities anywhere from six machines to several hundred a year. Some of them possess considerable facilities; some of them work in a very crude manner. In the aggregate, they form a by no means unimportant section of the business, their gross output probably exceeding that of the factories. For these reasons, the component parts are far more finished than in the case of your

own fittings. The set sent, as in fact all the fittings, are a portion of the ordinary commercial output, just as bought by the country builder. You will see that the only work necessary is to strip the parts down, complete the frames, file up and then finish. In some cases the sets are sent, as to you, without forksides, but it is quite the usual practice for assemblers to buy the front forks built into the crowns.

#### Barrel Patterns Frowned Upon.

In the bottom bracket you will notice that the diameters of the bearing are very much smaller than with American fittings. This is one reason why we prefer machined brackets to sheet metal ones. Speaking personally, I must admit a decided preference for English bottom bracket construction. I have yet to hear a sound mechanical argument in favor of excessive diameters or anything approaching the 1 $\frac{3}{4}$ -inch inside measurement to be found on most American brackets. I take it that the diameter of your brackets is consequent upon the use of sheet metal fittings, which demand a considerable amount of skill in order to obtain the necessary metal with which to form the lugs. The use of the one piece crank hanger is, I presume, the result, rather than the cause of the large diameters. I see many American bicycles with bottom brackets possessing an outside measurement of 2 inches and more, with flush joint chain stays  $\frac{3}{4}$ -inches in diameter. The type of bearing used in the bottom bracket sent is to all intents and purposes universal on this side, so

THE POPULARITY OF  

# Barnes Bicycles

was never more evident than it is this season.

Riders know the BARNES to be the free running and lasting kind.

Agents know it is the BARNES line which brings them prosperity.

It is the general excellence of the BARNES which satisfies.

much so that quite 98 per cent of all bicycles built are made in this style. I myself believe it to be absolutely the best bearing for bottom brackets, being positively free from complications, easy to adjust, permanently locked, giving a full width between the balls, and oil retaining in a marked degree. I should like to see a couple of American refinements added in the form of ball retainers and dust excluding washers. The type of ball race usually adopted is a two point type with radial points of contact, 60 degrees to the axis. I would call your attention to the locking device in the B. S. A. bracket. If you loosen the nut at the bottom of the cup, and give the disc a turn, you will find that the cotter pin will free itself.

#### Plain Crank Shafts.

You will notice that solid axles are used in both of the bottom brackets sent you. These axles can be formed upon a full automatic screw machine, or for moderate outputs can be economically produced on hand capstans, although I am sorry to say many concerns are content to turn them with ordinary slide rest lathes. The B. S. A. Co. turns them on heavy lathes of a type peculiar to its own shops. An ordinary turning tool is used, but the lathe is entirely self-acting, although not automatic in its feed of material. In this instance, as in others, where turning tools are used, the axle is made of a steel forging. The axles are usually case hardened all over, but only ground on the ball races. In some shops the bar is cut into lengths, and a deep groove of the section suitable to form the ball races is turned at the two points of contact. The bar is then carbonized all over, after which the superfluous metal at the ends and in the center is turned off, thus leaving the grooves, now forming the ball races, carbonized, while the rest of the axle has a less cohesive nature. You will readily see that when this axle is hardened and tempered the only portion that will be file proof will be the wearing parts, the rest of the axle being comparatively soft. This is excellent practice, although for ordinary commercial output somewhat superfluous, as the number of axles which break is almost infinitesimal. The discs, or cups, to use the expression more readily understood, are always turned on automatic screw machines, excepting in the case of small outputs, when hand capstans are used. There is a slight tendency displayed at the present time which may possibly result in a movement of considerable importance, towards devising a cup adjusting bearing in which there will be no necessity for threading the outside of the cups. This will, of course, enable the cup to be ground all over. The consummation of this improvement would result in a refinement of considerable value.

You will probably be somewhat struck with the appearance of the square cranks of the sample sent. This is usually put down to the inherent conservatism of the English bicycle maker. As a matter of fact, it is in strict accordance with the demands of the English public, and the traditions of the English engineer. Round cranks were formerly furnished, but a distinct preference has always been shown for the square type.

#### Split Crank Eyes Disappearing.

The cotter pin is still almost universal on this side, but I think it both unmechanical and expensive, although it gives practically no trouble when fitted in the manner evidenced in the fitting sent you. You will notice that the B. S. A. crank is split at the pedal. I am convinced that this is a mistake, and that the principle is being rapidly superseded by that adopted by American manufacturers.

The other bottom bracket which you have received is made in a plant which is to all intents and purposes an American factory. Like many other English shops so equipped, the nature of the tools is but poorly understood, consequently the quality of the output does not compare with that of the B. S. A., which shop is essentially a European shop. There are, however, some points of design I should like to call your attention to. In the first place you will note that the cranks are fitted very close to the bottom bracket face. This is undoubtedly good; one of the grave faults of the cup and cone bearing, which was once universal here, and is still common in America, is that a considerable amount of room is wasted between the crank and bottom bracket.

#### [Sprocket Wheels Always Detachable.

I would also call your attention to the banjo type of chain wheel attachment. This method is more usually found on factory bicycles than on component parts. In fact, the bracket in question is the only separate fitting which I could obtain to send you. It is, however, so large-

ly used by bicycle makers that it is worth your serious consideration. You will notice that the chain wheels with us are always detachable and interchangeable.

#### GERMAN FIRE CYCLE

Four-Wheel Hose Vehicle Driven By Two Men—Is Light and Speedy—Apparatus Carried.

While the bicycle has never been brought into more than experimental use in this country as an aid to fire department work, German fire apparatus builders have for several years given this line of improvement considerable attention. One of the most recent results of their labors is a fire department cycle which, though it may be imperfect in many details, is said to be very efficient in the accomplishment of its intended purposes.

It is a four-wheel truck, with a low, compact superstructure, is fully equipped as an engine and has a complete outfit of life-saving apparatus. The wheels have solid rubber tires, it is operated by two firemen, sitting tandem, and runs rapidly on good roads, while its handling and maneuvering is extremely simple. The firemen having the one in charge at Gruenewald, a suburb of Berlin, recently covered a mile, made the hydrant attachment and were at work in something less than five minutes.

The bicycle engine carries the following tools and implements, stowed snugly away, and each held securely in place: One life-saving sack, four water gauges, one heavy woolen cloth or blanket; one pickaxe, one hydraulic key, one standpipe or nozzle, one spraypipe or nozzle, one spade, one adjustable rope and hooked

ladder, one life line, one leather pouch with life-saving gun and line, one medicine chest, with bandages and drugs; one smoke mask, with vinegar and ammonia in bottles and leather pouch; one bell, one lantern and sixty feet of hose, one tool chest and one torch. The weight of the machine itself and all it carries is 377 pounds, and the price of the entire outfit is \$275.

#### DROP FRAMES IN THE SOUTH

Their Common Use by All Members of the Family Explains a Mystery.

"In central Florida everyone rides the drop frame woman's pattern of bicycle. The machine is a piece of property common to the household, like the dining table and the dog. It belongs to no one in particular and all use it," says a cyclist who recently returned from a sojourn in the flowery peninsula. "This custom is not confined strictly to the 'crackers,' for some of the more prosperous of the farming classes and villagers follow it. The cycle there is more a vehicle of utility than in the North, speaking in a general way. It is employed for visiting and shopping much more faithfully than in the cities. The riding is over shell and clay road and is very fair; some of the roads, in fact, are ideal, because the clay packs as hard and smooth as cement.

"This is all true in other parts of the South besides Florida, from what I can gather, and it explains the wonderful increase in the production and sale of women's bicycles which has puzzled makers of and dealers in these machines for two or three years.

"In 1897 and 1898 the sales of women's drop frame machines increased greatly. There was, sure enough, a big increase in the number of women riders, but it was not sufficient to account for the disproportion of the sales in the two kinds of machines. You have no doubt seen, as I have, men who go riding on Sundays only and use a drop frame—the machines they bought for their wives, who use them on week days, and it is not an uncommon circumstance, either. Still, there is not enough of that sort of thing done in the North to make any appreciable difference in the proportion of sales, which must therefore be attributed to the very general use of the drop frame in the South."

#### Working Overtime.

The most important element on the financial side of the question of overtime work is that of wages, says the Iron Age. This is the only item, too, which is known with absolute certainty; all the others which go to make up a cost sheet are subject more or less to judgment. The lighting and heating of the shop for night work and the cost of the lessened production, hour by hour, as compared with day work, can only be ascertained approximately. Another uncertain and yet essential item is the cost of correcting blunders made during night work. The lighting, heating and power accounts are not subject to much variation. Most shops pay larger wages for overtime work. If the men receive a time and a half for night work, then the labor expense is increased 50 per cent, and as this is the most important single item, its effect upon the total cost is significant.

Toronto's cycling population last year was estimated at 25,000, and it is thought the reduction in prices of bicycles and improvement of streets will increase the number by half the coming season.

Midnight cycle rides are becoming popular in Australia.

"WAS EVER THE LIKE BEFORE?"

# THE EVER VICTORIOUS ELDREDGE

SCORES STILL ANOTHER GREAT VICTORY

At San Francisco Six Day Race  
February 12-18, 1899,  
in which event THREE RIDERS of

## Eldredge Bicycles fitted with Eldredge Tires

TOTALLY ECLIPSED ALL FORMER RECORDS

Chas. W. Miller, Long Distance Champion  
"Teddy" Hale, European Champion  
Louis Gimm, 24-Hour Champion

New World's Record and First Place by Miller, 2,192<sup>1</sup>/<sub>4</sub> Miles; supposedly impossible feat made easy by riding the ever unfailing Eldredge.

## COMMERCE IN FOREIGN MARKETS

### CYCLE SALESMEN IN SOUTH AMERICA

Since a few of our cycle makers have traveling salesmen in South America, and they are meeting with success, it is a matter of considerable interest to know the general methods by which they have reached that success. One who has traveled all over South America says that a knowledge of Portuguese is indispensable in Brazil. Spanish will do in every other place.

The combination of requirements valuable to the foreign salesman is the possession of a refined, gentlemanly bearing, habitual politeness, and the patience to endure with complacency all kinds of delays and postponements. A gentlemanly bearing and suave manners are two strong inherited characteristics of the Latin-American, and it is by these traits that foreigners are usually judged. Politeness costs nothing and brings fair returns in any country, but in no portion of the world are the returns greater than in South America. It is not only the means of saving many dollars in the course of a trip, but the exercise of this virtue invariably secures attentions and valuable services which money cannot buy.

South Americans also give dress greater prominence in the make-up of the man than we do. They are prone to judge a man more by his clothes than we do, and it is therefore well worth while catering to these ideas. Flashy clothes of loud patterns, and in fact light colored clothing of any description, are considered bad taste. South American gentlemen dress in very subdued shades, black being the favorite color. The long frock coat and silk hat are, by the way, two indispensable articles of a South American merchant's wardrobe and are worn at any time during the day. This is a point to be remembered by every salesman who expects to travel there. To be dressed beyond the criticism of your customer is a point to your advantage.

The bluff, boisterous mannerisms of a fair proportion of our commercial travelers are not understood much farther south than the Rio Grande. In Latin-America it is falsely interpreted as an evidence of a limited education and a lack of refinement. This is also a fact worth remembering. But by far the most trying phase of commercial traveling in South America to the American character is the slowness with which the results are accomplished and the excessive delays one has to put up with on every hand.

### DEVELOPMENT OF RUSSIAN MANUFACTORIES

The Russian machine works are not yet able to fully supply the wants of the country, but no doubt within a short period Russia will be almost independent of foreign aid in this respect, as every year large and well-equipped works, supplied with an abundance of capital, are erected in that country, mostly by English, German, Belgian and French capitalists or stock concerns. The success of these works is guaranteed just now by the large government orders for supplies for the Siberian and other roads, and also by the great demand for machinery of all kinds throughout the country. The high import duty affords protection to all such undertakings. So far, Russia has not been able to export any machinery or products of technical industry, but this industry is progressing rapidly. There is still a decided lack of skilled labor,

while there are plenty of able and well-educated engineers.

The government aids the erection of industrial establishments in all parts of the country, with the view of making Russia independent of foreign countries, decreasing the importation of foreign goods and sustaining home industry.

The present policy differs from the one pursued in former years in that most of the large stock concerns for manufacturing machines, railroad supplies, etc., which have come into existence during the last four or five years are controlled by foreigners who formerly were almost prohibited from investing their money in this manner.

### CYCLE TRADE IN SOUTH AMERICA

A Chicago wheelman, who has spent several years traveling about the world on his bicycle, states that the trade in bicycles in South American countries has been much exaggerated in the American press. Buenos Ayres struck him as the best field, as the roads are very fine, as a rule, and the use of bicycles is bound to become as prevalent as in this country. The climate, too, is very much like our own. While British and German machines have been having the call, the buyers have recently taken up American bicycles, which are driving the others out of the field.

In Colombia and Venezuela very few bicycles are used, and in Ecuador hardly any. In Peru they have some sale in the cities as luxuries, but in none of these countries will the use of bicycles become at all general, he thinks, as there are no roads, and owing to the revolutionary tendencies of the people.

In British Guiana the gold fields are producing great wealth, particularly those near Demerara, and the prosperous residents of that town ride bicycles, even on the comparatively poor roads, which are now being improved. In the Barbados there are a great many riders, and the number is rapidly increasing in Jamaica.

### CHAIN WHEEL SHROUDS ABROAD

A dead set seems to have been made in some quarters in England against the shroud on chain wheels, and the elimination of this long standing feature in cycle construction would certainly be accompanied by some great advantages. At the same time it would be futile to throw it out on the grounds of its faults alone, and it may easily be seen that it has many great advantages, while its competitor for favor, the unshrouded wheel, has also many disadvantages. These advantages and disadvantages have, we believe, been rather neglected, and a rush has been made for the unshrouded wheel without taking into proper consideration the relative merits of the two systems. It is a question upon which opinion is very greatly divided, and capable men in the cycle trade are at present holding very different views of the question.

At the South African industrial and art exhibition which opened December 15 in Grahamstown, the exhibit of bicycles is large and consists principally of English manufactures, the only American machine being curiously examined. The United States stands second in the imports of bicycles into this country.

In Brussels the police have an exhibition of stolen bicycles.

### CYCLE PATENTS IN JAPAN

A decision recently rendered by the Japanese patent bureau is of great importance to American cycle investors, as it decides that no foreign patent which has had prior registration in another country can be registered in Japan. This would seem to show that protection supposed to be enjoyed by foreign inventors under existing treaties does not exist, as the provisions of these treaties are wholly inapplicable to the patents already in existence, any of which can still be pirated in Japan.

A protest was filed on behalf of a British subject against the refusal by the patent examiners of his application for a patent on a bicycle improvement. The examiners had refused registration on the ground that the machine in question was identical with one which the applicant had patented in the British patent office in 1895. It was argued that although the invention was published in the British official patent reports on February 3, 1897, the applicant did not receive a copy of the report in question until April 6 in the same year, and the application for the patent in Japan was lodged on the following day (April 7). Thus there was not sufficient time for the said report to be circulated in Japan. It was, therefore, impossible to say that the invention in the application was already for public use in Japan before the application for the patent was made. After examining all the documents concerning the application the following judgment was given:

"The point in dispute in this case was whether an invention patented in a foreign country before the application had been made in Japan for a patent could or could not be patented in Japan. The applicant maintained that an invention patented in a foreign country and publicly known was not publicly known as intended in Clause 3 of Article II of the patent law, and that he was not precluded, therefore, from obtaining patent rights in Japan. But an invention which has been publicly made known before the date of the application, from whatsoever cause, excepting for the purpose of experiment, cannot be granted patent rights (in Japan). An invention which has been patented and publicly made known in a foreign country cannot be said to have been made known to the public through experiments. A patent in a foreign country, therefore, cannot be regarded as coming under Clause 3 of Article II of the patent law.

"The applicant further maintained that the term 'public use' applied only to the district under the laws which have force within the jurisdiction of the patent bureau granting the application. But an invention which has been publicly made known will naturally be known to the public generally, so that the district cannot be limited excepting where restrictions are specifically made by laws or treaties. The invention in this application was patented in the British patent bureau in 1895 and published in the British official patent reports issued on February 3, 1897. It was, therefore, evident that the invention was in 'public use,' within the meaning of the Japanese patent law, and the examiners were justified in refusing to grant a patent for the invention. For the reason above cited, the bureau upholds the decision of the examiners."

# CYCLE AGE

Vol. XXII. No. 17.

THE CYCLE AGE OFFICE.

February 23, 1899.

## MODERN BICYCLE REPAIRS

SPLENDID WORK NOW READY FOR PUBLICATION BY THE CYCLE AGE

It Will Embrace All the Practical Suggestions Which Practical Men Have Been Able to Furnish—Will Contain 100 Illustrations

It may be said with perfect truth that no repairer, be his shop great or small, can afford to miss the valuable matter contained in "Modern Bicycle Repairs."

It will be published by THE CYCLE AGE, and ready for delivery a week hence.

The book is illustrated in a workmanlike style. More than one hundred illustrations.

The following brief extract of its contents will furnish an idea of its character :

### CHAPTER 1—REPAIRS, OR REPLACEMENT

First equipment of the shop. A study of economical methods. Illustrations of good and bad methods. List and cost of tools and fittings. Use of assembling jacks.

### CHAPTER 2—WHEELS AND COMPONENT PARTS

Purchase of spokes, sizes to buy and how to keep them. Rims; tools for spacing and drilling. Inexpensive truing jigs. To repair broken spoke holes in hubs. Nipple grips. Replacing cups and cones. To braze a split cone.

### CHAPTER 3—FRAME AND FORKS, BRAZERS AND BRAZING

To braze without spoiling enamel. Three ways to repair broken tube. Broken lugs, fork ends and fork stems. Dangers of twisted forks. Truing a frame. Selection of a brazer.

### CHAPTER 4—REMODELING OF FRAMES

Computing the cost. Cutting down frames. Changes of all sorts in singles and tandems.

### CHAPTER 5—THE CRANK HANGER

Remodeling. Loose cranks. Buckled tandem sprockets. Two-piece construction.

### CHAPTER 6—THE STEERING HEAD

Broken crown cones. A question of solder. Fixing loose cones. Squeaking steering heads. Rust on nickel.

### CHAPTER 7—SEAT POSTS AND HANDLE BARS

Broken parts. Internal expanders. The flashing of tubing. Ways of bending bars.

### CHAPTER 8—HINTS ON THE ART OF ENAMELING

Necessary equipment. Keeping of enamels. Coating and baking. Two and three color work.

### CHAPTER 9—SADDLES AND PEDALS

Springs and clamps. Repairing pneumatic

saddles. Rattan lacing. To make pommel clip. Broken springs. Difficulties of pedal repairs and how to overcome them.

### CHAPTER 10—BUILDING FRAMES FROM COMPONENT PARTS

Should be undertaken by men of experience only. A variety of patterns. Correct angles. Dimensions. Cheap mandrels and their uses.

### CHAPTER 11—PURCHASING PARTS FOR SPECIAL WORK

Ingenuity of great value; examples. Meth-

"Cycle Ad-ages" has been selected as the most appropriate title for this page. It was suggested by Mr. George Wilcox, of 51-71 Taylor Street, Springfield, Mass., to whom a check has been mailed in accordance with last week's offer.

Other suggestions received were: Our Own Affairs, Something About Ourselves, Our Way of Thinking, We'll Tell You All About It, What We Do, Where We Come In, Open Court of Cycle Age, Cycle Age and Counsel, Forum and Council, Cycle Age Council Table, Cycle Age Forum, Among Ourselves, Between U and Us, Our Mutual Interest, Spark-ulets, Multum in Parvo, Our Horn, Cycle Age Pointers, Practical Pointers, Original Cycle Sayings, Cycle Adlets, Plain Talks, Our Little Corner, A Page to Ourselves, Our Benefit Your Benefit, Have You Read This, Always Interesting, The Puffery, Our Own Business, Oh! Listen To the Band.

—And they are still coming.

ods by which many parts may be made of unexpected value.

### CHAPTER 12—EXPERIMENTING WITH CONSTRUCTION

Repairmen best suited to devise practical improvements. Value of their ideas.

### CHAPTER 13—MECHANICAL POWER IN THE SHOP

Practical advantages. Cheapest forms of motors. Installation. Floor plan.

### CHAPTER 14—MISCELLANEOUS REPAIRS AND SUGGESTIONS.

### CHAPTER 15—TIRE REPAIRS

According to tire construction. Method for each kind described.

Price to CYCLE AGE Subscribers, One Dollar; to all others, Two Dollars. Order at once. First come, first served.

## \$25 FOR AN IDEA!

THERE IS ONE WEEK LEFT IN WHICH TO EARN IT!

The CYCLE AGE will pay its Subscribers to Tell how it can best Please them.

The best Answer to the following Question received at the CYCLE AGE Office before March 1st is worth \$25 to the Subscriber who sends it:

Suppose you were the Editor of the CYCLE AGE, what changes, if any, would you make and why.

- |             |   |
|-------------|---|
| Would you   | { Enlarge any Department?<br>Decrease any Department?<br>Omit anything it now Prints?<br>Add anything?          |
| Do you like | { The Illustrations?<br>The "Information for Buyers?"<br>The Motor-Car matter?                                  |
| Do you read | { The Sport Department?<br>The facts about America's Increasing Foreign Trade?<br>For Amusement or Information? |

### SATISFIED ADVERTISERS

You certainly have got the wires moving for us in this business, for we have been and are yet answering letters which say, "Saw it in The Cycle Age."

LONG BEAM LAMP CO.  
Hillsboro, Ohio.

### THE BUSINESS END WON

An Attempt to Prejudice Subscribers and What Came of It.

Some time ago a contemporary took advantage of a paragraph in a correspondent's letter and endeavored to show that THE CYCLE AGE was not interesting to agents.

The correspondent was an agent out in Oregon.

THE CYCLE AGE respects the opinion of every reader. It therefore placed before the one in question a few facts concerning the value of the paper.

Being a sensible man he saw the point. This is what he says:

"Trade developments and mechanical items interest me as they do, or ought to do, every agent. If you have not sent papers every week please send back numbers at once."

And here is another quotation from the same letter which speaks for itself:

"You may enter my subscription to The Cycle Age. I enclose \$2.00 to pay for same."

## PUBLIC'S THIRST FOR FACTS

### French Buyers of Motor Vehicles Demand Description of Vital Principles of Construction

That the fear of imitators which impels manufacturers to surround the construction of motor vehicles with as much secrecy as possible often brings about exactly the opposite result of that which was intended, is the contention of a French writer in the technical automobile press who often finds himself hampered by the mystery cult of motor vehicle constructors.

He reasons plausibly that full publicity in regard to every detail is the only means by which the public can be made to distinguish between originators and imitators, and that it always favors the former when the case is clear. He also holds that the public must ultimately learn to understand the whole mechanism of a commodity which is destined to become so common as motor vehicles and will not consent very long to purchase any vehicle whose construction is not laid bare.

#### Apache Tricks With Patents.

"It was formerly the fashion," he writes, "for a constructor to conceal as much as possible the real functions of his mechanical arrangements. Actuated by the idea, which is perfectly correct, that it is nearly always easy to circumvent a patent, and under the impression—which is less correct—that all competitors were watching his movement and were ready to copy his work, he resorted to all sorts of Apache tricks. To put the imitator on the wrong track he adopted a policy of mystification, gave false description of his mechanism in his patent, took out an insignificant patent in his own name and caused some obscure stool-pigeon to take out the real one which nobody would then take the trouble of investigating under the unknown name.

"For a long time the technical press was under these circumstances very meagerly fed with facts and was reduced to doing unsatisfactory work.

#### The Kind of Description Wanted.

"Lately a number of manufacturers have discovered their error and are willing to furnish diagrams showing the principal organs of their vehicles and complete explanations of their functions, and the result is that in these instances the press can do justice to their constructions by indicating clearly on what points each vehicle shows originality and differs from other vehicles in the market. To do more and describe each bolt and nut in a vehicle would be pedantic. No capable journal will consider it advisable to describe in forty columns those minor points which a twenty minutes personal examination would make much more clearly understood. Abundance of details on unimportant points is likely to obscure the real point at issue and give readers false impressions. Details are liable to be changed at any time and the most minute description of them cannot take the place of practical examination, while the practical examination easily takes the place of all detailed description. What the technical press wants is the principle of the mechanism apart from all minor details of execution.

#### Public is Growing Critical.

"The small number of vehicle constructors who still hesitate to furnish descriptions of this character should rea-

lize that the public attitude to motor construction is undergoing rapid transformation through the information which nobody can prevent them from obtaining when motor vehicles are sold in the open market. This public which formerly received with confidence the emphatic declarations which served for descriptions, now demand to know why and wherefore a new pattern of vehicle is 'new' and what claims it has on their patronage.

"Only the other day a constructor told the writer that a lay purchaser of a vehicle, who would not ordinarily have been considered a competent judge, made a criticism of his purchase which proved so eminently correct, that the change which was made to satisfy him was subsequently incorporated in all vehicles of the same pattern.

"When such things can happen it is painful to receive information about a new vehicle about as follows: 'We send you herewith photograph of our vehicle for publication. We don't wish to publish details. State only that the vehicle mounts eighteen percent gradients readily at a speed of ten miles per hour and costs only three cents to operate per mile.'

#### Most Described Vehicles Mostly Sold.

"It is readily understood that it is not always advisable to be in a great hurry about giving descriptions; but they should not be concealed indefinitely.

"Are not the most 'described' vehicles also those which are most readily sold? The public is invariably inclined to mete out justice to mere imitators and, rather than purchase from a house which copies the designs of others, applies to the originators who have the advantage of longer experience.

"In order to thwart infringers by secrecy it would be necessary not only to withhold descriptions but also to refuse to sell the vehicles."

#### The American Purchaser.

The writer of the above, the editor of La Locomotion Automobile, when speaking of the public desire for understanding the construction of motor vehicles before buying, has of course reference to the French public only and his remarks may not be directly applied to the United States where the public interest in motor vehicles has not yet crystallized into a general determination to purchase at the first favorable opportunity. But his observations foreshadow a condition which may prevail here before very long and which the foresighted manufacturer may see his way to anticipate with great profit to himself.

The main point at issue and on which opinions will be divided, is whether the American public will consent to become extensive patrons of the motor vehicle industry before they understand the essential principles of motor vehicle construction or will insist upon receiving this education, however hard it may be to acquire, before spending their money.

#### Extraordinary Automobile Speed.

A successful attempt to regain the motor vehicle records for one and two kilometers, lost to Count de Chasseloup-Loubat, was made on January 27 by M. Jenatzy with his road wagon near Paris.

He started slowly to avoid accident to the machinery and as a consequence failed to lower the record of 57 seconds held by the count for the standing start kilometer. Jenatzy covered the second kilometer, with flying start, however, in the astonishing time of 44 4-5 seconds, reducing the previous record by 6 2-5 seconds. The two kilometers (1¼ miles) were ridden in 1:41 4-5, as against the count's record of 1:47 3-5. The second kilometer was ridden at the rate of more than fifty miles an hour.

#### ALCOHOL MOTOR VEHICLES

First One Patented in 1895 in France—Revenue on Spirits Discourages Experiments Here.

The alcohol motor continues to engage the attention of vehicle manufacturers in France by reason of its comparative freedom from the objectionable odors which follow French gasoline engine vehicles. A civil engineer, G. Moysan, 44 bis, boulevard de Chateaudun, Saint Denis, states in La Locomotion Automobile that he obtained a patent for an alcohol motor in 1895 and found it possible to suppress all odor of alcohol from the exhaust with a vehicle constructed according to his invention. He still has the vehicle and desires to enter into negotiations with constructors who may desire to develop his idea further, his failing health having prevented him from doing so alone.

In United States the revenue laws which impose a considerable burden upon the production of alcohol, even for industrial purposes, have kept all thought of substituting alcohol for gasoline in the background, aside from the greater calorific value and expansive force of gasoline vapors, but this restriction may be only temporary and should hardly prevent American builders of motor vehicles from keeping abreast of the developments which may possibly be in store for alcohol vehicles.

In colonial countries where American vehicle builders will undoubtedly compete with Europeans for supplying the vehicle market, alcohol may in many instances be produced by local industry at a lower figure than gasoline, everything considered.

#### Motor Vehicle Lines for Madagascar.

The French Society of Colonial Transportation last October made a contract with the governor of Madagascar for the transportation of passengers, freight and mail in the island, to begin April 1, 1899. Choice of any kind of power is allowed, but the use of automobiles has been practically decided on by the company, which will very soon begin running such vehicles over the completed part of the road between Mahatsara and Tananarive. If the experiment proves successful it is expected that similar services will be organized in other French colonies.

#### Motor Vehicles for Drummers.

A French manufacturer, Dr. Claude Brothier at Villefagnan, Charente, France, has commenced the construction of light motor vehicles especially intended for commercial travelers and announces that his experiments warrant him in stating that the vehicles are of practical design, price and equipment. It seems that a demand for this class of wagons has sprung up suddenly in France and found the makers generally entirely unprepared.

From May 1 all cyclists in France are to carry a number plate. Foreigners staying less than three months in the country need not conform to the regulation.

# THE PASTIME AND SPORT

## MILLER WINS BY MANY MILES

Chicagoan Adds 185 Miles to His World's Record—Aaronson Climbs Steadily to Second Place.

Score at the Finish.

M.	L.	M.	L.
Miller	2,192	Alberts	1,828
Aaronson	2,146	Barnaby	1,792
Fredericks	2,090	Pilkington	1,729
Hale	2,062	Lawson	1,635
Gimm	2,060	Julius	1,501
Nawn	2,012	Ashinger	1,500

San Francisco, Feb. 20.—The six-day-as-you-please on the eight-lap board track in Mechanics' Pavilion was brought to a close at 10:15 Sunday night by the management, who decided that, as there was no probability of the contestants making any change in their relative positions, they could as well be spared the agonies of the half hour remaining to round out the 144 hours since the start of the race.

No riders ever welcomed the end of a race more heartily than the even dozen men who remained in the contest to the finish. As the score plainly indicates, the struggle for supremacy had been the hardest ever fought, and human endurance was all but completely exhausted. Only the closeness of the finish and the cheers of the spectators kept the men to their task.

### Victor's Honors Well Merited.

Miller was 185½ miles ahead of the best previous indoor record of 2,007 miles 4 laps made by himself at Madison Square Garden last December. He deserves his victory and his record will probably stand for years to come. No previous contest has been so stubbornly contested from start to finish and no similar number of men have shown such wonderful pluck and endurance. Crowds that almost rivaled those in attendance at the closing hours of the New York contest last December remained in the big pavilion throughout Saturday night and Sunday.

It was a noisy, but sympathetic and impartial crowd, urging and encouraging each rider in turn. There was plenty of enthusiasm, too, when Miller, at the end of the 127th hour, rode his 2,000th mile in 2:25 3-5, unpaced.

### Riders Too Tired to Sprint.

During the last day the sprinting was infrequent, the pace earlier in the race having exhausted the vitality of the men, but Nawn and Barnaby were repeatedly stimulated with electric batteries and each time came out and indulged in sharp sprints until again exhausted.

The sensation the last day was the wonderful sprinting of Fredericks, the Swiss rider. Throughout the entire day he rode rings around Miller, Aaronson, and the entire bunch. In twenty-four hours he jumped from eighth place to third, and gave Aaronson the hardest kind of a race for second place.

Gimm dropped down the line rapidly Sunday, losing mile after mile to Aaronson and Fredericks, being unable to overcome his physical weakness.

Throughout the entire last day Hale imagined himself riding to San Jose, but his physical condition was good and he kept steadily at work.

### Miller's Remarkable Endurance.

Miller's endurance is marvelous, and his long lead of forty-six miles over

Aaronson demonstrates his superiority beyond controversy. He used his head with as much success as his muscles, for he was systematic throughout the event, taking short periods of rest at frequent intervals from the start instead of entirely exhausting himself by continuing as long as possible without rest in the first half of the contest. At regular times he would leave the track and put himself under his trainer's care for fifteen minutes to half an hour. His longest absence was thirty-eight minutes. Some unfavorable criticism has been elicited, however, by the champion saving himself at the expense of his opponents by taking all the pace he could get and refraining to set any. By this method he wore out Gimm, who was in the lead during the third and fourth days and who was looked upon until the fifth day, as being his most formidable rival and as a probable winner.

Stevens, who was No. 13, quit early in the race and declined to go on although he was in good condition and riding well and his trainer used every endeavor to make him go on. His dropping out left thirteen still in the contest.

### Julius Admired for Pluck.

Julius, on the contrary, won the admiration of everybody by pluckily continuing to ride after his trainer ran away with all his money and valuables, leaving his charge with no one to care for him and with nothing to purchase necessary food and attention with. But one of the other trainers volunteered his services and stuck to him throughout the rest of the race.

Miller took the lead in the fourteenth century from Gimm and kept it to the finish, constantly gaining on previous records. He suffered much from a sore ankle which he had bandaged during the last day.

Hale was delirious several times during the race, but his trainers dared not give him much rest for fear he would lose third position to Fredericks, which he nevertheless did in the closing hours.

Pierce, who had dropped to eighth position by Friday, dropped out altogether on Saturday.

### Aaronson Little Noticed.

Aaronson worked his way up steadily from tenth position the first day to second place at the finish without attracting much attention or comment. Although little notice was taken of him he apparently had a good chance for first place when Saturday dawned, but he could no longer stand the strain and began to lose to Miller.

In the short distance events that were run after the finish of the big race, Harry Elks defeated Jay Eaton easily in a five-mile match race in 9:52, and Downing and Cotter on a tandem won a mile match with Fournier on his motorcycle in 1:54 4-5.

Charles Turville won an Australian pursuit race from Chapman, Waller and Stevens in 4:19 4-5, covering 2 miles 7 laps.

Michael rode a mile exhibition in 1:51 2-5, Gibson went two miles in 4:10 and Bald did a half in :55, all paced by the Frenchman's "infernal machine."

Tom Cooper is authority for the statement that himself and Bald, Kiser and Gardiner will race together this year as a team, racing at all distances but of course preferring the sprints.

## ECONOMY OF THE NEW METHOD

Pacemaking By Motorcycle Will Increase Middle Distance Racing—Benefit to Racing Men.

Interest in motor pacing has been developing rapidly since Fournier landed in New York early in the winter with his petroleum pacing tricycle. Although his only attempt to demonstrate the superiority of mechanical pacing over human pacing failed at Madison Square Garden through the slipping of a driving belt, it seems to be the generally accepted belief that before the close of the coming racing season motor pacing will have become a common form of assistance in middle and long distance racing.

It was the introduction of middle distance racing and the growth in popularity of twenty-four-hour and six-day contests that make possible the importation of this innovation, for up to the present time no motor driven machine has been designed, even in France, where motorcycle construction had its birth and has been most highly developed, that could surpass human pacing in short races, up to, say, ten miles. The intricate but perfect machinery of man's anatomy can be brought into complete effectiveness much more quickly than any petroleum or electric motor that has yet been applied to any bicycle or tricycle, so that for short distances a cycle driven by men can outrun a motorcycle; but the mechanical cycle is tireless and in the longer distance has the advantage of not having to be relieved.

### Immense Saving of Expense.

The advantages of motor pacing are manifold, but the greatest of them, from the standpoint of the manufacturer or the track association which is retaining the rider, is its comparative cheapness. The costliness of maintaining an aggregation of human pacemakers has been frequently estimated and published. For a match race of one hour's duration about thirty men are needed. To get these men into proper condition several weeks of training are required, at an expense for salaries, quarters and track facilities. Eight or ten multiples, costing from \$50 to perhaps \$200 or \$300 to manufacture, must be furnished by the maker or secured by the manager, and other incidental expenses make this kind of pacing rather a luxury for any bicycle maker or racing association.

On the other hand, a motor driven tandem or tricycle which can be bought in Paris at a cost of \$500 and upwards would need but one or two riders to manage it, and could be used throughout every contest in which a given man competed, and the one or two men required to manage it would not need to be relieved except in races of six hours' duration or longer, and then one, or at most two other crews, would be sufficient for the entire race. These men would not need to indulge in long weeks of training for speed and endurance, and the expense would be reduced accordingly.

### Will Create Lower Records.

Further than this, mechanical pacing is superior from the racing man's side of the question, because when following the multiplet the rider is not under the necessity of constantly watching for the pickups which, even at the best, cause the loss of some time and incidentally

fret the principal in the race, and the speed can be regulated to the exact ability of the rider without the variation of a second to the mile. Thus the worry and exhaustion caused by alternate sprinting and slowing down is obviated.

The superiority and advantages of motor pacing are so manifest that American pacemakers dread to see any of these machines tried in this country, and even threatened a boycott at Madison Square Garden if Fournier and his machine were employed. The Frenchman was so alive to this jealousy that he had his tricycle constantly guarded for fear some injury would be done to it. If the trials prove satisfactory the pacemakers believe that a complete change in pacing methods will quickly take place and that the majority of them will inevitably lose their means of livelihood.

#### Pacemakers Take Narrow View.

This is undoubtedly a very shortsighted view to take of the matter. As a matter of fact, the success of motor pacing in this country would mean the promotion of many more match races and middle-distance contests than are now or ever have been run, because of the lessened cost. The twenty-four-hour events could then be paced and the demand for riders capable of operating the petroleum or electric machines would quickly exceed the supply. Interest of the race meet goers in this style of pacing would certainly be keen, at least until it had become common, and operatives capable of managing the machines could command better prices than even expert pacemakers on ordinary multiplers. Instead of opposing the introduction of this style of pacing, therefore, it would seem to be to the advantage of our racing men to make every effort to become familiar with such machines, and for some of our manufacturers to undertake the manufacture of them seriously.

#### Results Depend on Pacemakers.

In Europe these auto-motive two and three-wheelers have aroused a great deal of enthusiastic interest, and motor pacing has been brought to a high degree of efficiency. Both track and road races are thus paced in France, where a number of race meets have been run of late with contests between motorcycles as the principal events.

It is commonly admitted that the result of a paced contest depends as much on the pacemakers as on the principals, and that with the latter almost evenly matched, the contest resolves itself into a fight between the pacing teams. The recognition of this has led to a desire for more perfect pacing methods which shall eliminate faulty pickups and give each principal the benefit of all the pacing he can stand. Only in this way can a perfectly fair comparison of the ability and speed endurance of two or more riders be arrived at.

#### Mobile Interested in Racing.

The Mobile Cycle Racing Association was organized a fortnight ago at Mobile, Ala., with J. M. Hamner, president and general manager and T. T. Wentworth, secretary. The purpose of the association is to give races and advance the sport in general. A piece of ground has been leased near Frascati, fronting on the bay shellroad, and an eight-lap track will be constructed at once, which is expected to be ready by March 1. Efforts will be made to secure all the noted riders in competition.

#### Preliminaries of Chicago Road Race.

At the annual meeting of the delegates of the Associated Cycling Clubs of Chicago, held Monday night, W. C. Malley, of the Woodlawn C. C., was unanimously

elected to succeed R. G. Fisher as president of the organization. As soon as he took the chair the old question of consolidating with the Cook County Cyclists' Association and the Northwest Cycle Racing Association of the city in the running of the Decoration Day road race, over which the wrangle occurred last year, was brought up. A committee was appointed to conduct negotiations. It was reported that three lawyers are working on the draft of a good roads bill to be introduced into the state legislature.

#### GIMM SERIOUSLY ILL

Lies in a Semi-Conscious State With Raging Fever  
—Belief That He Was Drugged.

San Francisco, Feb. 21.—As a result of the terrible strain of the six-day continuous race, Louis Gimm lay all day yesterday in a half conscious condition with his blood at a temperature of 104 in a raging fever. He collapsed at 8 o'clock Sunday night and could not appear at the finish two hours later to receive his meed of applause and admiration for the good showing he had made. Gimm's trainer and some of his friends openly assert that he must have been drugged, as his collapse was too sudden to be due to natural causes, he having throughout appeared to be one of the freshest of the contestants.

Up to the end of the third day he was riding very strongly, when suddenly he went all to pieces, and afterward rode around like one in a trance. He seemed dazed, and acted very strangely for a rider who was in such splendid condition.

Trainer John West, who looked after the feeding of Miller, Gimm, and Aaronson, strongly substantiates the charges made by Gimm's trainer, Leonert. "It would have been a simple matter for some one to drop a morphine tablet or something of that sort in one of Gimm's feeding cups," said West, "and especially as they have allowed so many outsiders to gather around the feeding stands. Gimm has certainly puzzled me during the past three days, and that he has been drugged I am positive. He was in better trim than Aaronson at the start, and has been fed upon the same things that have been given to both Miller and Aaronson, so I can attribute his sudden decline into this stupor to nothing else than that he has been tampered with."

In view of the fact that a great deal of money was wagered that Gimm would win, it is believed some one interested in the betting administered the dose to the unfortunate rider.

LATER.—Gimm is improving slowly and the doctors say that his collapse is the natural result of his chronic malady. Rumors of foul play are persistent, however, and the physicians will thoroughly examine their patient for evidences of the administration of poisonous drugs.

#### The Chairmanship Situation.

The many enthusiasts who have been speculating anxiously for many weeks regarding the identity of the chairman of the League racing board to be soon appointed by President Keenan, were last week "struck of a heap" by the published announcement that C. W. Mears of Cleveland would not accept that office if it were tendered him, the reason given being that press of other duties would make it impossible to devote the necessary time to wielding Gideon's bloody axe and filling his shoes satisfactorily.

The early work done in the west for Keenan's cause by Mears as the "original Keenan man" warranted the common belief that he would soon chivalrously relieve the present incumbent-by-proxy of

that office of the load of perplexities. Therefore the announcement is abundantly mystifying.

To further add to rife speculation, Arthur Augustus Zimmerman has just announced in Troy, N. Y., that he would have no serious objections to doing the heroic and assuming further responsibilities as chairman of the board.

#### All Racing Men Antagonized.

Philadelphia, Feb. 20.—The League members in this city seem to be well satisfied with all but one feature of the work of the recent National Assembly—the imposition of a \$2 registration fee upon the amateur racing men. It is argued that the present is hardly the time for an innovation of this radical character; the League should just now make every effort to retain the allegiance of all racing men—professionals and amateurs alike—rather than frame laws calculated to arouse everything antagonistic and pugnacious in the make-up of those young men. That such action should have been taken in the face of the announcement of the establishment of an amateur class by the A. C. R. U. savors of shortsightedness. Says a returned delegate: "It got through during one of the few silly moments in an otherwise remarkable convention."

#### To Continue on Old Lines.

President Keenan's attitude toward racing matters is evidenced in his statement in Pittsburg Tuesday outlining the policy of the new administration, which he said "will take the proper steps to control track racing in the future, as in the past, in the interest of the public and to protect the purity of the sport. The fact that the L. A. W. has no selfish interest in controlling racing is an effective argument," he said, "against any hostile movement which has only mercenary motives behind it. On the other hand, those who have made legitimate investments in racing-track property will plainly perceive that their best interests are served by the maintenance of public confidence in the integrity of the sport."

#### France's President Patronized Racing.

Felix Faure, the late president of France who died last week, was a great lover of all kinds of sport and especially favored cycle racing. Upon several occasions he attended the great prize races in Paris attended by a large suite, watching the events with keen delight and close attention. He received the winners in his box with as much graciousness as if they had been diplomats, and made it a custom to always offer a personal prize, usually in the form of a *Serves* vase.

King Leopold of Belgium is also a great admirer of bicycle races and assists almost every year at the races given during the national fete, for which he offers a handsome prize, usually of silver. This is put up for an event called "the king's prize race."

#### Winter Circuit Meet in Rome.

The European winter circuit now in Italy, where, on Sunday, February 5, the riders ran the qualifying heats for the great prize of Rome, the final of which was to be run the following Sunday. The distance was 2,000 meters. Tommaselli ran second to Ramella in the first heat, Grogna ran third to Ferrari and Maffi in the second, Singrossi won the third heat and Banker finished second to Gonelli in the last heat. The 3,000-meter tandem race was very exciting, the four teams finishing almost abreast and separated by inches only. By the decision of the judges Banker and Tom-

**T**HE delight in cycling is in smooth and easy running bearings, in fact, the bearings come pretty near making the bicycle. In the finishing touches on those parts we spend thousands of dollars annually which other makers save. We gain by that extra expenditure enduring reputation, satisfied riders and growing business. **This hanger bearing is the most important of all and in it we have all the good points which make riding easy.** In our catalog we describe this bearing fully and show you why it is the best. Your customer will be won by these good points. They are not talking points—simply meritorious and substantial improvements which make the NATIONAL run easier than others.

INDIANAPOLIS, IND.

maselli were given fourth place, Dei and Singrossi winning the event in 5:01 3-5.

#### Boston and Montreal to Co-Operate.

The World's Meet Club having in charge the international championship races is about to meet a committee from Boston to arrange for a circuit to precede or succeed the international event, to attract the foreign riders. The League meet in Boston and the I. C. A. meet in Montreal will furnish two weeks of sport and there are a number of cities in Canada which will be willing to put on races after the championships. It is said the Boston committee will arrange one race for \$1,000, and the Canadians hope to do the same in Montreal.

#### NEWS IN BRIEF.

Earl Peabody is now in the railroad business in Macon, Ga.

Morin, the French rider, who is now doing military service, is seriously ill.

The bill for the protection of bicycle paths in Minnesota passed the state legislature by a vote of 85 to 23.

Patchogue, L. I., is endeavoring to obtain the spring meet of the New York State division of the L. A. W.

A winter racing circuit, principally for local riders, has been arranged for northern Africa, embracing Algiers, Tunis and Egypt.

Racing promoter James Kennedy is reported as having signified a desire to take a large aggregation of crack racing men to Cuba the coming season.

The C. R. C. mileage record in Illinois for 1898 has been officially awarded to W. G. Howe, of the Chicago Cycling Club, who covered 20,556 miles during the year.

The Atlantic Athletic Association of New York city, with J. A. Blaurock at its head, is arranging to conduct a series of race meets at the Manhattan Beach track, whose managers recently signified willingness to

join hands with the National Cycling Association. The opening meet will be held on June 17.

The Chicago A. C. C. is discussing the advisability of promoting a series of local track races for the coming season to stimulate interest in the sport among the clubs.

Harry Elkes has become a prize favorite in San Francisco because of his speed and splendid style in riding. He is credited with having broken a record every time he rode.

Gougoltz was the king pin of a small race meet run in Hyeres, southern France, February 5, where he won the twenty-five kilometer paced race and the "international" open contest.

Night races are to be made a feature at Ambrose Park track next summer, for which a complete electric illuminating plant will be installed. Meets will be run twice a week in warm weather.

Many of the long distance riders now on the coast have announced that they will sail from New York in April for France in order to compete in the 96-hour continuous race to be held at the Roubaix track, near Paris, May 7.

The Roubaix, France, long distance international race in which Miller and several other riders now in California expect to compete next May, has been changed from a 96-hour event to a consecutive 100-hour race, to begin May 8.

The Brentwood Cycle Club, of Brentwood, L. I., has made a bid for the contract to keep the roads in repair in its district for the coming year. By the gratuitous services of its officers more money will be made available for use on the roads.

Al Weing asserts that all talk of Michael meeting Elkes, Gibson or Macfarland in a match race on the coast is mere speculation, as the little Welshman is in California solely to ride exhibitions. He denies that his charge is under the management of Kennedy.

At the recent annual meeting of the Philadelphia Associated Cycling Clubs, the nominations for office developed the fact that for the first time in the association's existence there will not be a single contest for any of the elective offices. There was just exactly one peg for each hole. An

appropriation was made to thoroughly sign-board the Atlantic City route. The treasurer's report showed a balance off \$1,766.39.

The Riders' Syndicate of France has decided to send a delegation to the racing committee of the U. W. F. to discuss the question of securing licenses for the French riders disqualified by the L. A. W. for riding at the unsanctioned races in Madison Square Garden.

The presence of the racing men on the coast was too much for Otto Ziegler, who got the fever again and hurriedly sold his interest in a meat market and decided to go on the path again. He may go to Europe this summer. He has just recovered from the frightful fall he had in his last race about a year ago.

The first important clash between the L. A. W. and the National Cycling Association over the control of racing will come, it is thought, during the military tournament to be given at Madison Square Garden next month, in which tempting prizes will be offered for which the suspended riders belonging to the N. C. A. will want to compete.

The Union Velocipedique de France, in accordance with its agreement with the L. A. W. and the International Cyclists' Association, gave notice at its last meeting that a fine of \$50 was imposed, with suspension until paid, on all riders who took part in the last six-day race at Madison Square Garden. Among the French riders who are included in the list of those so fined are Stephane, Frederick and Joyeux, who have gone back home much disgusted with the entire affair, it is said.

With the retirement of Clinton R. Coulter from the racing field, the last of the quartet of unpaced riders which has held all the records for some years is gone from the field. Walter Sanger is manufacturing adjustable handle-bars at Milwaukee, Hamilton is running a coal yard at Denver, Fred Titus is on the stage, and Coulter is in the window glass business. Titus was known as the unpaced king, and held the records above the mile and up to ten. Coulter still claims the mile record with 1:59 1-3, claiming to have proof that Hamilton was paced to the tape. Sanger claims the record with 2:00 1-5, averring proofs that Coulter never made his record time of 1:59 1-5, and Titus holds a broad claim over all of competitive champion at unpaced work.

# INFORMATION FOR BUYERS

## BRIDGEPORT WISHBONE LAMP BRACKET.

The accompanying illustration shows the new wishbone lamp bracket made by the Bridgeport Brass Co. of New York city, manufacturer of the Searchlight oil and acetylene gas lamps. The bracket attaches to both fork blades near the crown and holds the lamp centrally above the front wheel. In this way the advantages of both the fork side and the steering head lamp bracket are obtained, for the lamp turns with the front wheel and is at the same

THE CYCLE AGE

time directly in front of the rider. It leaves room at the same time for the attachment of a lever brake and cannot slip down the fork side and become entangled in the spokes of the wheel, causing a fall.

## FAUBER BRACKET FOR 3-CROWN FRAMES.

The illustration herewith shows the construction of the hanger bracket and attached rear fork crown on which a patent was last week granted to W. H. Fauber of Chicago. The crown is for use in three-crown frames and is made of two stamped sections which are welded together by the electrical welding process. In order that there may be but a central division between the two parts and that the stamping operations may be simple, the half tubular sections which form the rear crown and the branch which attaches it to the bracket are made in a plane at right angles to that in which they properly belong. This brings the crown after the two sections are welded together in a vertical instead of a horizontal position. The branch is then clamped in a cylindrical die and the fork side lugs of the crown clamped in suitable forms

which hold them at their proper distance to each other and the branch is then twisted one-quarter turn, bringing the crown into its correct position.

## M. & M. W. CO.'S GOODWILL BOUGHT.

The faculty of ready appreciation of one's opportunities is a faculty possessed by comparatively few people. One of the few, however, is found in the person of Mr. George Robie, manager of the Excelsior

Supply Co. As chronicled in the Cycle Age the warehouse of the Manufacturers' & Merchants' Warehouse Co. burned last week. So disastrous was the fire that every particle of stock was destroyed, while books and other valuables are buried deep in masses of masonry. Small wonder, then, that the company concluded to go out of business. The goodwill of so old a house was, of course, of great value—a fact quickly recognized by the Excelsior people, who promptly opened negotiations for the same. A straight, business-like proposition was made and accepted within 48 hours and on Monday the goodwill of the old business became the property of the Excelsior Supply Co.

Perhaps one of the most satisfactory details of the arrangement is the fact that many of the employes of the defunct concern are to be retained under the new deal. Their knowledge of the affairs of the business will add largely to the effectiveness of a working force already one of the best in the trade. The Excelsior company secures, in addition, a number of business connections with manufacturers.

## THE NATIONAL CHAIN ADJUSTER.

The National Cycle Mfg. Co. of Bay City, Mich., is proud of the simplicity of its chain adjuster shown in the illustration. When on the bicycle it resembles in external appearance an ordinary rear fork end and washer. The action is nicely gauged so that it is impossible to throw the wheel out of line. The operation consists in turning the washer which has a raised scroll on its inner face, this scroll engaging notches in the side of the fork end fitting and mov-

THE CYCLE AGE

ing along the slot as it turns, much after the action of a worm and rack. When tightened by the axle nuts it is impossible for the adjustment to slip.

## NEW CHAIN AND CHAINLESS WARWICKS.

The newly organized Warwick Cycle Co. which has bought out the machinery and stock of the old Warwick company in Springfield, Mass., announces its intention of continuing the manufacture of only first-class bicycles to list at \$50. The New Warwick will be strictly up-to-date and the finest that skilled artisans can produce for the standard price, and the equipment the best and most expensive, it being the company's belief that nothing ordinary or commonplace should be fitted to machines of the first quality. Every little detail, in fact, is to receive that attention which strictly first class goods must have in order to take a prominent position, and the company feels confident that such attention will be appreciated by that portion of the public which is fastidious enough to want the best.

Chainless bicycles will be made a feature of the production. They will be driven by bevel gear mechanism, which has been adopted after crucial tests of various other kinds of transmitting devices. They will have one-piece cranks and shaft—the only one yet used commercially in bevel gear bicycles—but will be exactly the same in appearance as the chain driven machines except in the driving mechanism, and will combine style, character and beauty with strength and easy running qualities.

The president of the old company, George A. Russel, is president of the new firm, and A. O. Very, the former treasurer and mechanical expert, will have charge of the finances of the new concern and give his personal supervision to the construction of

the machines. The fact that these experienced men are directing affairs and will be intimately identified with the product, is sufficient guarantee of its character.

Owners of Warwicks purchased in the past can secure parts for repairs from the new concern.

The new output will all be marketed from the New York office at 34 Union Square, East, where all communications regarding bicycles, parts, etc., should be sent.

## BANKER HOME EXERCISER.

The accompanying illustration shows the No. 4 cycle stand made by the Banker Bros. Cycle Co. of Pittsburg, Pa. It is a

combined floor stand and home trainer and has proven a good winter sideline in cycle stores. Various tensions of resistance against the rotation of the rear wheel may be obtained by means of the strap which supports the forward end of the frame carrying the friction roller. On a ladies' machine the strap is fastened to the handle bar instead of to the top frame rail as shown in the illustration. The stand rests on castors and can be placed in any desired position without lifting. It is finished in aluminum bronze. Both wheels of the bicycle it supports are held in the stand so that the rear end is not tipped upward.

## KIRKPATRICK SADDLES IN DEMAND.

The Kirkpatrick Saddle Co. of Springfield, O., states that it is well pleased with its trade so far this season, as it is doing more business than was anticipated. It finds, with gratification, that there is little objection on the part of buyers to paying a fair price for an article of real merit. The Kirkpatrick saddles can now be secured from the following distributing agents: F. A. Hastings & Co., 159 Lake street, Chicago; C. M. Rice Co., 105 Chambers street, New York city; George D. Boles, 75 Hawley street Boston, Mass., and McMaster Eldredge & Maugle, 635 Arch street, Philadelphia.

takes up all shocks caused by roughness of the road.

Another good feature of this saddle is the Hollenbeck Lock Tilting clamp, which is so constructed that it can be tilted to any position and there locked. This, in conjunction with the Hollenbeck spring, gives a 4-inch range of adjustment from front to rear, without disturbing the position of the

THE CYCLE AGE.

saddle. The Hollenbeck company will sell this clamp separately to anyone who desires it, as it will fit any round wire spring on any of the prominent makes of saddles. With this clamp the rider can obtain a low position of his saddle on the frame.

#### WAVERLEY AND IVANHOE BICYCLES.

The catalogue of the Indiana Bicycle Co. of Indianapolis is designed and printed in a most novel manner and as an advertising medium is sure to bring returns. The inside pages are in the form of a folder and are inclosed in a decorated cover which forms the mailing envelope. The cover, being handsomely scrolled and lettered in gold and dark red on a sage green background, is certain to attract favorable attention from every mail clerk who handles it while en route to its destination, and whoever received it would be lacking in ordinary interest if he did not open it to scan the contents.

The two regular patterns of Waverley bicycles are shown within the folder. These machines list at \$40 each and in their construction and design show signs of work tending toward general refinement rather than toward radical changes. The company's cheaper machines, the Ivanhoe and Ivanhoe Special, which sell at \$25 and \$35 each respectively, are listed in a separate circular. The Ivanhoe machines are not Waverley bicycles, either in character of material, construction or finish, and are not made in connection with the Waverley but in a separate plant which was equipped for the manufacture of medium grade cycles last year. The Ivanhoes are offered simply as honest, reliable bicycles at moderate prices, and the company claims as much merit for them as is possible to be given machines selling at the prices asked for them.

#### ANDRAE SUNDRIES CATALOGUE READY.

During the past few years the Julius Andrae & Sons Co., of Milwaukee, Wis., has been doing an extensive business in jobbing bicycle sundries. The company issues a complete sundries catalogue each year. The 1899 catalogue has just been completed and will be mailed to any agent desiring a copy.

#### INSTRUCTIONS FOR BEVEL GEAR CYCLES.

Believing that intelligent care of bevel gear bicycles by riders will be stimulated by correct advice on the subject, and with the intention of saving owners of Stearns

chainless machines from expensive experience when a few well directed words might make haphazard tinkering unnecessary, E. C. Stearns & Co. of Syracuse have issued a little pamphlet containing full directions for the care and adjustment of the Stearns chainless bicycles. The pamphlet is illustrated and tells in straightforward language intelligible to anyone how to adjust the ball bearings on the connecting shaft, the hanger bearings and those in the rear hub; how to adjust the gears so that they will mesh properly; how to lubricate the various bearings and gears; how to remove the forward driving gear and the ball cup on the right side of the hanger, and how to remove and replace the rear hub dust cap.

#### KEENE WHEEL ASSEMBLING JIG.

Herewith is illustrated the Keene wheel assembling jig, one of the devices which recently attracted much attention at the New York cycle show. The new feature of this chuck is the adjustable jaws which render it equally well suited for assembling 26, 28 or 30-inch wheels. The adjusting mechanism is exceedingly simple, and only

two or three minutes' time is required to change from one size to another. The large bed casting is accurately machined in a lathe in four operations. The several operations of milling and drilling are done in accurate jigs. The construction throughout is very rigid, to resist the severe warping and diametrical strains.

As to the efficiency of this machine, it was shown repeatedly at the New York cycle show that a wheel can be completely assembled inside of eight minutes.

The price of this machine is placed very low to enable every repairer to have one. It is manufactured by the New England Cycle Supply Co., Keene, N. H.

#### THROUGH A LAPSE OF ATTENTION.

Since everybody in the bicycle trade knows with his eyes shut that the Keating

Wheel Co. is located in Middletown, Conn., it is almost superfluous to state that it was through one of those inexplicable temporary aberrations of mind that the address of this old, reliable and familiar firm was last week given in an advertisement in this paper as Middletown, O.

#### CLEVELAND HOUSE FOR STEARNS CYCLES.

The Rice Bicycle Co., with its principal office at Syracuse, N. Y., has been incorporated at Albany for the purpose of conducting a bicycle business at Cleveland, O. This firm has been organized especially for the purpose of representing Stearns bicycles in Cleveland. It has secured an excellent location at 232 Euclid avenue and has hastened to complete the fitting up of its place of business to be ready for the general opening of bicycle houses which began Monday. The company has a neatly appointed store, and under the management of John W. Rice, former agent for E. C. Stearns & Co. at Painesville, O., expects to do a good business in the Cleveland field.

H. R. Gilbert and Frank C. Riggs, for several years connected with E. C. Stearns & Co., are interested in the enterprise, but remain in their present positions at Syracuse.

#### BESLY'S OIL AND OIL CUPS.

Charles H. Besly & Co., 12 North Canal street, Chicago, report numerous large orders for their celebrated Helmet oil and Perfection and Bonanza oil cups. Among others, shipments have been made to the J. I. Case Threshing Machine Co., Pullman's Palace Car Co., Charles Parker Co., Crane Elevator Co., Brown Hoisting & Conveying Machine Co., a Cleveland automatic bicycle machinery company, and two of the oldest cycle making firms in America. The last two concerns use this oil for assembling wheels and coating steel balls, ball bearings and other wearing parts. One firm has adopted this oil for use on its bevel gear chainless bicycles.

The McCormick Harvesting Machine Co., Otis Elevator Co. and American Steel & Wire Co. are ordering Bonanza oil cups for use on their machinery.

#### OLD RELIABLE TIRE MAKERS.

The New Brunswick Rubber Co. of New Brunswick, N. J., is doing a very large business in its various grades of tires. From the present outlook it will this season double the business that it did last year. The New Brunswick Co. is managed by conservative business men of many years' successful experience, who, though they have been making bicycle tires for only four or five years, had been in the rubber manufacturing field for many years before they took up tires. In fact, the New Brunswick Rubber Co. is one of the oldest rubber manufacturing companies in the world. It was founded in 1839 and incorporated ten years later. It has had sixty years of successful existence.

#### ANDRAE CYCLES AT THE SHOWS.

The entire line of Andrae cycles is being exhibited this week at the Philadelphia show and will also be shown at Pittsburg and Washington. The exhibit at the Pittsburg show will be in charge of the Justice Cycle Co., assisted by John C. Schmidbauer, the company's representative. The Andrae exhibit at Washington will be in charge of the West End Cycle Co.

A patent was granted this week to George A. Burwell of Toledo on the Burwell mechanically fastened detachable tire which is a well known feature of Cleveland bicycles.

## WHALEY BICYCLE STIRRUPS!!

"The Best Toe Clips. The Best Selling Toe Clips."

Patent Dec. 29, 1896.  
Patent Sept. 14, 1897.  
Further patent allowed.

SOLD BY ALL

## Crawford Bicycle...

for 1899 the highest efficiency has been reached by a combination of all desirable points in the most perfect form, no one part being abnormally developed to the detriment of another. The result is a bicycle of the highest quality possible for skill and experience, combined with capital and with a plant capable of production on a scale large enough to allow selling at a popular price.

We call special attention to our model tandems at \$75.00. We also offer with entire confidence our \$50.00, \$35.00 and \$25.00 models as unequaled at those prices; and our Juveniles at \$30.00, \$25.00 and \$20.00, together with our Chainless make the line of Crawford Bicycles harmonious and complete.

WE ARE MAINTAINING A HIGH STANDARD FOR WORKMANSHIP.

## AGENTS TEMPT EARLY BUYERS

**Competition Among Buffalo Dealers Leads to Some Very Lively Bidding for Patronage.**

Buffalo dealers are considerably excited on account of the fact that two of their number are extensively advertising machines for sale at \$1 down and \$1 a week. It is well understood, however, that this offer will not last long. Another concern is offering machines for \$1 down and giving a credit of \$3 when the first payment is made—an offer which is advertised as the most liberal ever made in Buffalo. This latter firm claims to have sold 1,200 machines last year by means of the "pass-book" system. It is now offering "cash" bicycles for \$5 down and \$1.50 per week.

### Cautious Dealers Apprehend Danger.

On the other hand, more conservative dealers are endeavoring to offset the effect of these announcements by declaring that, while they have no such alluring offers to make, still they have goods for sale which in the end will prove better bargains. It is the general opinion that the sale of machines on terms of \$1 down and \$1 a week will unsettle trade conditions. Dealers are apprehensive lest buyers, seeing these announcements, may be led to imagine that such offers are only put out through necessity.

These appeals to buyers who may be short of cash, or careful in its distribution, has been tried before this in other cities, but never so early. Invariably wherever they have been tried they have resulted in severe loss.

Every year witnesses a shortening of the period during which agents carry customers who buy on the installment plan. Having this in mind it is natural for the dealers in Buffalo to deplore the fact that some of their number should be so greedy for patronage, or so hard pressed in competition, that they want only and for a long time in advance of the actual riding season endeavor to spoil the market.

### Small Dealers in Disrepute.

The annual crop of cheap bicycle makers is sprouting. Last year many of these concerns were subjected to such screaming abuse by the public, on account of defective workmanship, that the impression was prevalent that the city would not be troubled with their appearance this season, or, if they did appear, that their numbers would be fewer. Such, however, is not the case. For every shop which dropped out of sight last winter two are now to be found in its place and Buffalo is threatened with a repetition of the troubles experienced last year through the breaking of front forks.

The attitude of the Buffalo public toward small builders is not to be doubted, though it has not yet been tested this year. The bitter experience of last sea-

son on the part of many riders, who were persuaded that anyone could construct machines with safety, has not yet been forgotten. So many riders were seriously and painfully injured through the breaking of fork crowns made of malleable iron and imperfectly brazed frame joints that the daily papers, taking notice of the complaints, made the city too hot for these builders.

### Daily Papers Issue Warning.

"There is no excuse," said a writer in one of the newspapers last fall, "for a manufacturer who will deliberately place a poor and dangerous piece of work on the market and represent it as high-grade article, which is being done in this city every day. The people who buy wheels are certainly entitled to some protection, for they unknowingly run the risk of serious injury, or, worse yet, loss of life, by riding wheels that break without giving the least warning to the rider. It is the next thing to murder and all because the makers are too grasping to spend ten or fifteen cents to strengthen their fork stems."

This is a sample of the manner in which the press and public handle the matter.

"If you go into a bicycle store today," a local paper said last week, commenting upon the outlook for the coming season, "the salesman will almost invariably expatiate on the strength of the front fork of the machine he wants to sell you. The fatal accidents last year in Buffalo have driven manufacturers to all kinds of re-inforcements and strengthening devices. If you buy a '99 wheel of any reputable make you needn't bother about the front forks. They are all right."

### Big Swindler Arrested.

James Ferro, or a man calling himself by that name, has been arrested in New York city for obtaining goods under false pretenses from bicycle houses. There are twenty-two complaints against him and he is alleged to have swindled makers of bicycle goods out of \$10,000 worth of material and sundries. He used letterheads bearing the name "J. Ferro & Co," which is a reputable exporting house on Broadway. He was held in \$5,000 bail.

## CHICAGO JOBBERS ORGANIZE

**They Aim at Bettered Relations With Manufacturers and More Efficient Handling of Credits.**

The Chicago Cycle Supply Jobbers' Association is the title of the organization just completed by fifteen of Chicago's leading jobbers in cycle parts and sundries and which has immediately started to work to further in various ways the interests of its members. At the last meeting Paul Armstrong, of Armstrong Bros. Tool Co., was elected president and Robert Malcom, of the Excelsior Supply Co., secretary and treasurer. The vice-president has not yet been elected. The directors of the association are: B. E. Harris, of B. E. Harris & Co.; F. S. Waters, Jr., of the Chicago Tube Co., and W. J. Beckley, of the Beckley-Ralston Co. The president and secretary also serve as members ex-officio of the board of directors.

### Membership As At Present Composed.

The firms now holding membership in the association are as follows:

Hibbard, Spencer, Bartlett & Co.  
Excelsior Supply Co.  
Independent Supply Co.  
Beckley-Ralston Co.  
Eugene Arnstein.  
F. S. Waters & Co.  
Chicago Tube Co.  
Walker & Ehrman Mfg. Co.  
Armstrong Bros. Tool Co.  
Bicycle Repairers' Tool Co.  
J. P. Doig,  
B. E. Harris & Co.  
F. A. Hastings.  
J. E. Plew.

Several other jobbers, including A. G. Spalding & Bros., have signified their willingness to join the association later on.

### Protection Against Manufacturers.

The association has two important primary objects, besides that of bringing the jobbers of Chicago into closer and more harmonious relations with each other. The first is to protect the jobbers against the common practice of many manufacturers of parts in selling to small buyers at prices so little higher than the large lot prices that the jobber's business is materially injured. It is stated that some of the local makers of such parts as handle bars, seat posts, pedals, etc., will sell their parts in single or dozen lots to repairers and other small buyers at prices but little above that asked the jobbers who buy the parts by the thousand.

As a first step toward the improvement of such conditions the Chicago Cycle Supply Jobbers' Association has taken issue with the handle bar makers of Chicago and requested that a scale of prices be established which by gradually raising the prices as the size of the selling lots diminishes would force the many small local consumers of these parts to buy at the supply stores instead of at the fac-

tories. The secretary of the association reports that several of the handle bar makers are favorably inclined toward the proposition and that it is expected the move will be successful without any ill feeling.

#### Credit Bureau to Be Established.

The second important object of the association is to be of value to the credit departments of the firms represented in the membership. Systematic work, it is expected, will enable the association shortly to be in a position to handle the local credits, at least, with comparative safety and to shut off on credits granted indiscriminately to responsible and irresponsible local dealers and repairers.

#### Plan a National Movement.

That the general work of the credit bureau and of the association in every other line may be made as valuable as possible the secretary has written to numerous large jobbers in different cities throughout the country asking their cooperation in the enterprise. The object of sounding the out of town jobbers is not with a view to broadening the association into a national organization, but to induce as many jobbers as possible to organize local associations which, working together, would have the power of a national association. Such a plan, if successful, would not merely permit of interchange of information valuable to the credit departments, but would make a stronger trade factor of the jobbing element and enable each local association to profit by points learned in other cities as well as by its own individual experience.

Secretary Malcom has also opened correspondence with the recently organized Cycle Dealers' Protective Association of Boston and hopes to bring that association into harmonious and mutually advantageous co-operation with the Chicago association, so that the two may unite their facilities and thus form a sort of nucleus around which the national co-operative body of jobbers' associations may be formed.

The Chicago Cycle Supply Jobbers' Association invites correspondence upon all subjects of interest to supply jobbers from dealers and jobbers in other cities. The secretary's address is 88-90 Lake street, Chicago.

#### Exports of Bicycles and Materials.

Exports of bicycles and bicycle materials from the port of New York for the week ending February 21 are recorded as follows:

	Bicycles.	Material.
Holland .....	\$ 37,015	\$ 2,034
Germany .....	30,566	8,416
Denmark .....	11,800	4,750
France .....	5,939	1,976
England .....	2,609	4,599
Australia .....	5,845	2,594

A \$150,000 fire which destroyed the Lind building in Chicago last week burned out the Standard Bicycle Works, the American Nickel Plating Works, and Tugwell Bros., machinists.

## AUSTRALIAN AUCTION STOPPED

### ENGLISH CYCLES SELL CHEAPLY

#### The Austral Cycle Agency's Auction a Failure - American Machines Successful on the Path.

Sydney, Jan. 28.—The Austral Cycle Agency's much boomed and well advertised auction sale of eighty new and twenty second-hand machines here was a failure. The machines were all English and comprised among others the following well known makes: Beeston Humber, Triumph, Raleigh and Singer model de luxe. Notwithstanding the fact that the sale was well advertised and placed in the hands of the best auctioneer in Sydney, exceptionally low prices ruled, and after forty out of the one hundred had been disposed of the auctioneer was instructed to stop the sale.

#### Sold for Less Than Cost.

Some of the machines were actually sold for less than cost price, landed here. Raleighs, one of the very best English makes, were knocked down for \$40, and it cost the Austral Cycle Agency \$55 apiece to land them in Sydney. Beeston Humber went for \$70, and the cost of landing them here is \$90 apiece. The Singer model de luxe is one of the dearest English machines on the market. Some of the drop frame models of this mount were sold for \$35.50, while the Triumph, which cost the Austral Cycle Agency something like \$75 to import, was sold for \$40.50. This auction is regarded as absolutely the worst yet held in Australia. The Austral Cycle Agency have certainly dropped money over it, as they spent a lot of money in advertising it, and they can ill afford to lose money at present as they are in very straitened circumstances. The rest of the trade in New South Wales are extremely pleased that the auction was "a frost," as it will probably prevent any more being held for some considerable time.

#### American Machines Win on the Path.

American machines seem to have a mortgage over the A. N. A. race, which is run annually in Melbourne. This is the greatest handicap race in the world and carries larger prizes than the Austral race. The prizes for this year's event were \$1,250 first, \$625 second and \$225 third, while \$100 was divided among heat winners. When Matthews won this classic event on an American machine. The entries for the race numbered 258. Matthews was fourth in the Austral on the same machine. The A. N. A. race has now been won three times in succession on an American machine.

## ANOTHER BIG AUTOMOBILE CO.

#### Formed in the East and Alleged to Be in Opposition to the Croker-Leiter Concern.

Articles of incorporation have been filed at Trenton by the New York Electric Vehicle Transportation Company, with an authorized capital of \$25,000,000. The company is empowered to acquire, manufacture and sell vehicles of all kinds to be operated by electricity, compressed air, gas, oil, or other means of motive power; also to acquire franchises for the operating of these vehicles to carry passengers and freight of all descriptions.

Inquiries develop the fact that in the New York Electric Vehicle Company Croker's autotruck company is to have a formidable rival. The persons named in the articles of incorporation are merely figureheads, but behind them is

Isaac L. Rice, president of the Electric Storage Battery company, and president also of the Electric Vehicle company, the concern which is now operating the automobile cabs.

It appears that the new company is chartered to operate not only in the city but also in the state of New York, and will run vehicles for passenger and freight traffic in the city on the storage battery system. Just when the company will push its plans into operation cannot be ascertained, but it is definitely stated that autotrucks and delivery wagons will be included in the scope of the company's operations.

Croker's autotruck company has announced that it will sell no vehicles of any kind, but will operate them itself exclusively. The new company is out to sell vehicles of all kinds, equipped with electric motors.

## GIVES UP THE FIGHT

#### Lozier Secures Advice Against Opposing Georgia Tax—Makers Pay Tardily—Dealers Benefit.

The bill which was passed by the last Georgia legislature providing that each manufacturer of bicycles selling within the state, either directly or through agents, shall pay an annual tax of \$5 for each agent, will not be fought at the present by bicycle manufacturers. H. A. Lozier, Sr., who has shown much interest in the matter for several months, spending time and money looking into the case, and who, at the solicitation of several other prominent bicycle manufacturers, undertook to carry the matter before the supreme court of Georgia, has secured the opinion of Hon. Hoke Smith of Atlanta, who states that it would be inadvisable to fight the tax. This, together with the fact that the Georgia supreme court in 1897 rendered an adverse decision in a similar case—that of the Singer Mfg. Co. versus Wright, page 114, 1897 Georgia reports—has led H. A. Lozier & Co. to let the matter drop for the time being and to pay the tax.

Up to the present time only twenty companies doing business in the state have complied with the statute, and the ordinaries of the various counties are being notified to send in the names of the delinquents at once. It is understood that more than seventy-five different bicycle manufacturers throughout the country are represented by agents in Georgia.

The comptroller announces that he will in the near future begin to issue executions against those firms that have not complied with the letter of the law.

Before doing business under this act all manufacturers, their dealers and agents, are required to register their names with the ordinaries of the counties in which they propose to operate and exhibit the license obtained from the office of the comptroller general of the state.

Mayor Myer of Savannah has expressed himself very forcibly in opposition to the special act of the Georgia legislature, which, while it imposes a \$100 license on bicycle makers, exempts all dealers handling the machines in cities from municipal taxation.

The city of Savannah taxes bicycle dealers \$30 per year, but those dealers whose makers have paid the \$100 tax, have refused outright to pay the city. The comptroller general says the position of the dealers is correct.

Mayor Myers stated Friday that this was but one of many instances that showed him that the farming interest of the state control all legislation. He thinks there was a good deal of lobbying done by somebody in the legislature to get such a special measure through the house and he is anxious to know who profited thereby.

**HILSENDEGEN CHOPS PRICES****IS ANGRY AT TRIBUNE MAKERS**

**Because Territorial Control is Taken Away from Him He Makes Sharp Reprisals.**

Detroit, Mich., Feb. 28.—The principal topic of conversation among the dealers in this city and throughout the state of Michigan, has for its central figures George Hilsendegen and the Black Mfg. Co. Hilsendegen is out with large advertisements in the daily papers offering Tribune bicycles at reduced prices. The \$40 Tribune models he offers for \$30 and the \$50 models for \$40. In his announcement Hilsendegen makes this statement:

**Hilsendegen's Announcement.**

After mature consideration we have adopted for the year 1899 the policy of selling Tribune bicycles direct to riders, thus saving them the agent's profit—a policy we believe that will be fully appreciated by the riding public.

As we will thus have no Tribune agents in the state of Michigan, we will fill all orders direct to customers. Former agents and dealers need not apply for discounts; we have but the one price, as given above.

We will fill orders direct, shipping the wheels on approval, free of all expense, and pay expense of returning if not satisfactory. Address all orders to

The Tribune makers assert that Hilsendegen is resorting to unfair tactics to injure the sale of their machines. Hilsendegen has been the Tribune agent for the state of Michigan, part of Indiana and Ohio from 1894 to 1898. He contends that this year at a late date the Black company withdrew their agency from him and proceeded to sell direct to all agents in the territory above named. Then he cut the price of such Tribune machines as he was able to procure, and now announces his intention to continue this policy as long as the supply of goods holds out.

**Detroit Agency Given to Another.**

The Black company, for reasons best known to themselves, did not give Hilsendegen territory this year. They placed the Detroit agency in the hands of W. C. Rands. They state that Hilsendegen succeeded in obtaining a few machines from their Council Bluffs agent. The supply from this source has been stopped.

W. C. Rands naturally takes a hand in the fight. He is advertising a warning to all Tribune buyers to see that the serial numbers are found on the machines, as otherwise they will not be guaranteed except when purchased from regularly appointed agents.

**Looks Like Spite Work.**

Hilsendegen's attitude must, to say the least, be characterized as spiteful. His past services in the interest of the Black company were well requited, or else he would have abandoned the wholesale agency long ago; and remembering this fact, and the further fact that he is selling only Tribune bicycles direct to riders at a cost price, it is out of the question to admire the ethics of his side of the quarrel. Besides, it is manifestly absurd that he should affect to have a policy for the sale of machines for which he is not appointed agent. If there were logic in his attempt to sell machines he experiences the utmost difficulty in securing, the agency system would collapse and pirating would take the place of accepted business methods.

Hilsendegen's defiant position is, in short, characteristic of that class which violently insists upon making the sale of bicycles yield three profits before the goods reach the rider, and in this respect is inimical to the highest interests of the maker and agent. Before this wholesalers have spent their money in pushing the sale of bicycles, and when

through force of circumstances they have lost territorial control of the machines have not, as in this case, recklessly proceeded to spoil future sales by disaffecting buyers. In refraining from making an outcry, or seeking to retaliate for the loss, they have been philosophic enough to understand the true nature of the causes which worked their elimination.

**SOUTHERN SEASON OPENS**

**First Warm Weather Starts Sales With a Rush—Large Increase of Riders Expected.**

New Orleans, Feb. 28.—All the dealers in this city report heavy sales since the warm weather began. Despite the fact that the streets are being badly torn up, all agents predict a prosperous season. The indications are that the increase in riders this season will be 50 per cent. One of the best posted dealers in the city, speaking of the prospects, says:

"The price of high grade bicycles has been so materially reduced that a majority of riders feel like buying new mounts even though their present machines are still of service. As a result, my sales of new patterns have been very largely increased. I did a heavy business last week and expect to continue busy in the sales department for some time to come."

The bicycle jobbers, who are exceedingly active just now, state that while a good number of orders are from the country the bulk of business has been done in the city in the last week or so. They, too, anticipate a heavy increase in the number of cyclists.

**New Dunlop Company in Canada.**

The American Dunlop Tire Company has been formed in Canada to take over the Canadian business of the American Dunlop Tire Company. Its capital stock is \$1,000,000, of which \$300,000 is 7 per cent preference stock and the remainder common. The business done by the Canadian branch of the American Dunlop Tire Company in Canada has grown rapidly. In 1897 the net profits were \$35,000, and for the year ending with August 31, 1898, the net profits amounted to \$50,000. The shipments from the Canadian factory so far this year are almost 100 per cent greater than for the corresponding period of last year.

The directorate includes some of the best known business men in Canada. The president is Warren Y. Soper, of Ahearn & Soper, of Ottawa. On the board are Hon. George A. Cox, Edward Gurney, E. B. Ryckman and Richard Garland.

**No Road Toll on Bicycles.**

Buffalo, Feb. 27.—In the appellate division of the New York supreme court the case of the Rochester & Charlotte Turnpike Road Company against Phineas C. Joel came up for argument. This action was brought by the turnpike company to recover from the defendant the penalty of \$10 for each of five offenses which consisted in riding his bicycle past the toll gate without paying the two cents each time demanded of him. The question at issue was the right of the turnpike company to collect tolls for bicycles. It was contended by the defendant that that right was taken away by chapter 151 of the laws of 1898, and that all the acts complained of were committed since the passage of the act and constituted no offense against existing law. Judgment was ordered for the defendant, without costs.

An account stated can be opened only for correction on the ground of fraud, mistake, accident or undue advantage, and the burden of the proof rests upon the party seeking to open the account.

**VERY LOW TRADING-IN PRICES****CAUTIOUS COLUMBUS DEALERS**

**From \$5 to \$15 Will be Allowed for the General Run of Old Machines—Better Goods Wanted.**

Columbus, O., Feb. 28.—The trading in of second-hand machines has always resulted in some loss to the dealers of this city. By this is meant that a dealer who last season traded in, say, fifty second-hand machines at an average price of \$15 apiece was not able to sell these fifty machines so as to realize \$750. With one or two exceptions, the dealers here last season were strongly inclined to be quite conservative in making exchanges. It is yet too early to prophesy what will be done this year, but the general opinion, so far as it can be ascertained at the present hour, is that from \$5 to \$15 will be all that will be allowed for second-hand machines of the general run, with \$20 as the extreme allowance. This is probably an average of from \$10 to \$15 less than was allowed last year.

**Agents Look for Heavy Sales.**

The prospects for the retailers in this city and vicinity are exceedingly bright. In spite of the bad weather, many machines have been sold and many people are interested in cycling. It is the expectation that the reduced prices will lead to greater sales. One dealer speaking on this subject says:

"Many people who hitherto have refrained from purchasing a bicycle have done so owing to the high prices. These will now purchase because it is possible to obtain a good machine at a moderate sum. Others who have been riding a cheap bicycle, or one of old pattern, will, if in the least dissatisfied, now buy standard goods because they are marked low in price. Former prices have been prohibitory in so many cases that it is fair to assume, the usefulness of the bicycle not being in the least destroyed, that many converts will be made this season."

Thus far nearly all inquiry seems to be for higher priced goods of standard manufacture, a fact which is very encouraging to the dealers. The purchasing capacity of the public at large in Columbus is much larger than it was a year ago, and this state of affairs is not without its peculiar effect upon the bicycle business. Many cash sales are being made—more in fact than last season. When machines are sold on time, it is always possible to secure larger first payments and larger payments each month. These are significant features of the opening of this year's trade.

**Curbstone Agents Not Active.**

If there are curb-stone agents in Columbus they have not yet been so active as to interfere with the business of regularly established agents. The demand for 30-inch models is light—exceedingly light in comparison with the demand for chainless models, concerning which latter form of manufacture there is considerable inquiry.

During the past two years the demand for tandems has gradually faded away until just now no trade in these models is looked for by dealers. Nor are many of the double seaters made by repairmen. The fact is that tandems have not been reduced in price in proportion to the list valuation of single machines. In many cases two single machines can be bought for less than one tandem. This being the case, the majority of people prefer to buy two machines, as they can be used separately.

During the past year 4,700 bicycles were stolen in Berlin.

PRESENTING TESTIMONIALS.

GUS KITZINGER,  
Lumber By Cargo and Commission, Manistee, Mich.  
June 8, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., Milwaukee, Wis.  
Gentlemen:—Yours of third inst. at hand and contents noted. In reply, will say, that when I received your Milwaukee Patent Puncture-Proof tires about two months ago I had them placed on my wheel and have ridden them ever since, and I can conscientiously say they are all and more than you claim them to be. I have ridden quite a number of different makes of tires for the past four years, but never have I experienced such a pleasure in riding a bicycle as I have during the last two months, and all due to a tire unequaled in both quality and resiliency, and I can honestly say this is the liveliest tire I have ever ridden. The most pleasure in riding a bicycle is experienced when you know you are safe, and how can a person feel so when

he knows that he might at any moment be thrown from his mount by a punctured tire, and mayhap seriously injured? Yours very respectfully,  
(Signed) GUS KITZINGER.

J. A. HOLT & CO., Bicycles and Sundries, Milwaukee, Wis.  
Dec. 20, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., Milwaukee, Wis.  
Gentlemen:—We have handled your tire all of the past season and can conscientiously say that in our opinion they are the BEST TIRES on the market to-day. We have sold several dozen pairs of the tires and all our customers who are using the tires are more than pleased with them. They are everything you claim for them, being resilient, easy riding and absolutely puncture-proof for all actual service. Yours respectfully,  
(Signed) J. A. HOLT & Co.

Representatives Wanted. Write for Prices and Other Information.

Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## MAKERS LOOKING FOR SIDE LINES

If there were forthcoming the assurance that a continuation of the existing rivalry would not inevitably carry with it further reductions in list prices—and this is the prayer of all in the trade—it would be an easy matter, with shop economies practiced with a finer hand and a genuine attempt at harmonizing competitive methods, to rest content, for there are many conditions reigning within and without the trade which in normal times are regarded as the complements to commercial safety. There is a general air of robust cheerfulness over the prospects for the coming season, which is not affected for more than a moment because as a result of the recent severe weather factory orders were abruptly stopped and retail sales were put in cold storage. And if by some lucky accident of fortune this temporary satisfaction could be lengthened till it assumed the proportions of what in the bicycle business might be called permanency—say two or three years—both makers and agents would be able to put a safe estimate upon the value of skill in a game which all now admit is largely a matter of hazard.

But this assurance cannot be given. The hair trigger fraternity will not permit it; and hence the uneasiness and the incurable longing to pierce the future.

Uncertain hopes beget uncertain methods and variously affect different classes of makers. Just now high priced machines are experiencing a boom, and already their makers are gambling in futures. In a few months there may be a violent change and new values may have to be figured. In either event there will be disappointed losers. Amid all this uncertainty makers glow with enthusiasm over the motor vehicle. But motor vehicle manufacture only enthralls those who have never known its difficulties. It is said of one of the largest makers of such vehicles that last year he only managed to turn out fifty-five machines, while the capital invested in their manufacture must be expressed in six figures.

## REVIEW OF FOREIGN TRADE

Since it has been shown by government returns that, so far as the money volume of our cycle exports is concerned, foreign trade is slightly improved, it is of interest to analyze our relations with the various countries. Trade with England is still large, though the increasing re-exports of our goods from that country shows to what an extent the value of that market may be misunderstood by concerns which have no deep knowledge of it. Large as England's purchases of American cycles, parts, sundries and materials are, however, the total of our business dealings with the country during the past twelve months decreased 25 per cent.

For three years France has doubled its trade with us and last year took \$500,000 worth of our goods. It is one of the satisfactory markets in Europe, though least is heard of it. Germany's purchases show an increase of 20 per cent, with heavy sales in material, parts and sundries. Germany, however, is not a very desirable market for American manufacturers on account of the fact that the demand in cycles is for cheap grades. It is, in fact, notwithstanding its large volume of business, one of the most difficult European markets. In the other European countries the trade for the year shows a 20 per cent increase, with Russia as the most inviting market. The countries of Northern Europe are tolerably strong competitors of the United States in cheap bicycles, but are strong buyers of our materials and parts.

Our trade with Canada decreased 20 per cent in the twelve-month, the loss being principally borne by bicycle makers. Makers of materials and parts, however, as well as concerns manufacturing cheap bicycles, have gained a temporary advantage.

British India is just reckoned one of the best of our foreign markets. Last year the volume of cycle imports was five times as great as in 1897. Parts and sundries sell readily in that country. The South African market is steady at \$180,000 in the year. There is a strong and increasing demand for parts and material.

The wretched showing of Australia is ascribable to causes with which only those who have ventured so far away from home are familiar. The business is overdone. The island is under-populated, according to American views, for so vast an area. The effects of the rinderpest and drought, have extended to all branches of trade, and the result of all these afflictions has been to the American cycle exporting trade a falling off of upwards of 50 per cent.

## ENFORCED BICYCLE GUARANTEE

Whether Gallagher is at work for his constituents or for bicycle manufacturers is not as plain as it might be. Possibly he does not know, himself. He is a legislator and is attempting to make the state of Connecticut enact a law to the effect that new bicycles sold in that state shall hereafter be accompanied by a written or printed guarantee stating that "if any imperfections or defects in workmanship or material develop within two months from the date of sale, the same shall be made good to the buyer at the expense of the maker or sales agent."

Now, if Gallagher had added the provision that the purchaser of a bicycle in return for this guarantee should sign a statement absolving the manufacturer or agent from all further responsibility than that specified in the guarantee, the intentions of Gallagher would have been clear.

The provision would be impossible of enforcement and ridiculous, but it would mean something.

In Gallagher's diction the bill runs foul of common law which accords the purchaser the right for an indefinite period not only to have defects "made good" but to have every claim attended to that may arise from the unfitness of the purchased bicycle for its intended purpose. Yet the maker's guarantee does not at all abridge these rights. The maker cannot limit his own responsibility by declaration, even if his declaration is compulsory. A court with jurisdiction to assess damages would care nothing for a declaratory guarantee or for a law legalizing it.

If the legislator has the idea of furnishing the public with means for obtaining redress without litigation, he has missed his aim, for the manufacturer may always deny that any discovered shortcoming of the bicycle is due to original defects and may throw the burden of proof on the purchaser, and if, on the other hand, Gallagher means to give the general public the impression that they should not expect good service from a bicycle for more than two months he is giving the bicycle trade a black eye.

If, finally, he means to convey the idea that a bicycle which is good for two months should be considered so good that there is established a presumption that defects discovered later are due to the rider's abuse of his machine, he is working in favor of the sale of bicycles in which the factor of safety through poor material, construction or workmanship or by extraordinary lightness has been reduced to such a low point that the stresses of ordinary usage will reduce it further.

Being a legislator Gallagher, of course, does not know that steel structures deteriorate rapidly if they are subject to stresses that exceed one-half of their strength, so that they finally collapse under usage which did not seem to affect them at first. Good manufacturers know this, however, and build accordingly, although the temptation to reduce weight and cost of material is always great. Gallagher's bill would increase this temptation if passed.

Something may be needed to define the rights of the public and to forestall, in the interest of manufacturers, a possible epidemic of the blackmailing kind of damage suits, but the Gallagher bill is not the instrument by which this may be done.

## BRAZING BY IMMERSION

### Efficiency Gained by Use of Inclined Cover Tiles—Flangeless Crucible Proves Successful

Many factory superintendents who have installed standard brazing furnaces and operated them successfully have grasped the vital points of the immersion process so thoroughly that they are now able to experiment on minor points in furnace construction and to bring out ideas tending toward economy. These men are not making radical changes, but are suggesting small alterations which aim at higher efficiency without violating the main principles of accepted furnace design. A notable example is that which comes almost simultaneously from two factories, each using furnaces of the Fulton type, and which relates to the disposition of the cover tiles.

#### Furnaces With Inclined Cover Tiles.

It is granted by every successful user of immersion brazing that the heat and flame rising from the firebox must be projected to cover the top of the metal in the crucible in order that the brass may be kept at the same temperature in all parts of the crucible. Previously this has been accomplished by leaving heat spaces at both sides of the crucible and by placing horizontal cover tiles over the open tops of these spaces and about an inch above the upper edges of the

crucible, thus turning the direction of the rising heat and flame from vertical to horizontal. In the factories of the Geneva Cycle Co., of Geneva, O., and the Fay Mfg. Co., of Elyria, O., the utility of the cover tiles has been enhanced by inclining them laterally so that the inner side of each tile is lower than the outer.

The value of this change, which by the way can be made without in any way altering the construction of the furnace itself, will be readily gathered from Fig. 1, which is a combination sectional view of a furnace showing a regular horizontal tile on the left side and an inclined tile on the right. The arrows mark the approximate direction of the flames rising from the fire box. The flame indicated by the arrow E, when it strikes the bottom of the horizontal cover tile A, will be projected laterally across the crucible in an approximately horizontal direction to the point where the mechanical draft effect causes it to rise toward the hood of the furnace. The heating effect of this flame is due to two causes, that of radiation and that of the hot air cover which the horizontal flames maintain above the brass, thus shutting out cold drafts.

#### Flames Projected Directly Upon Metal.

If, however, the cover tile be inclined inwardly about ten degrees as indicated at B, the flame marked by the arrow F

will strike the cover and then be projected as shown in a direction approximately corresponding to the inclination of the tile, and will strike directly upon the flux floating over the spelter in the crucible and thus heat the contents of the

obviated. He uses in his furnace a crucible the general shape of which corresponds to that of the side flanged crucible but which is much smaller and lighter and with thinner side walls having no flanges whatever. The crucible has end flanges that it may be supported in the usual manner. With this combination of small, thin walled, flangeless crucible and inclined cover tiles it is stated that brazing heat can be attained in about thirty minutes' less time than was required when the standard form of flanged crucible and the horizontal cover tiles were used, and that the maintenance of the heat requires but three-quarters as much fuel.

FIG 2—CRUCIBLE WITHOUT SIDE FLANGES.

crucible by direct contact as well as by forming a heat cover to exclude cold air.

Though the inclined cover tile is adaptable to furnaces using the regular trough crucible with side flanges, Mr. Geo. Worthington, superintendent of the Fay Mfg. Co., has demonstrated that by their use the necessity of side flanges, if such necessity ever existed, is entirely

One of these crucibles which has seen eleven days' constant service is shown in Fig. 2, and it will be noticed that while the action of the flux upon the side walls has reduced one of the upper edges to about half its normal thickness, the crucible is not yet entirely useless. To be on the safe side, however, it was deemed best to replace it with a new crucible.

The cost of crucibles of this form being but \$3 each, it does not pay to take risks by working the crucibles to the extreme limit. Eleven days' use from a three dollar crucible means a crucible expense of less than 30 cents per day.

Fig. 3 shows the exact exterior appearance of a furnace in which the cover

FIG. 3—FURNACE WITH INCLINED TILES.

tiles are inclined for the purpose described. The furnace is in the factory of the Geneva Cycle Co.

### BACK PEDALING BRAKE

Rear Sprocket Clutch Combined With Brake Shoe—Eccentric Used in Place of Ratchet.

L. Conwell of Chicago has been granted a patent on the automatic rear sprocket clutch and brake illustrated. Differing from most brakes of this sort the loosely mounted sprocket does not engage in a driving manner with the rear wheel hub through the medium of a clutch or a ratchet, but by the friction of the same brake shoe and disk with which the machine is retarded by back pedaling. The device is designed so that it can be attached to an ordinary hub which is threaded right and left on the right end of the barrel for the reception of the usual sprocket and lock nut. On the threading next the spoke flange is screwed the hub of a vertical flange which has an over-turned edge forming an annular flange around its circumference. Locking this disk by screwing onto the outer left-threaded portion of the hub barrel is a sleeve having two external diameters, the inner and smaller of which is equal to that of the hub of the vertical flange so that the union of the two furnishes a flush surface on which the sprocket may rotate. The hole in the sprocket is counterbored from its outer edge so that the sprocket rests partly on the surface mentioned and partly on the enlarged portion of the locking sleeve. The brake shoe is mounted around the inwardly projecting sprocket hub, which latter is slightly eccentric to the axis of the hub and sprocket. Thus when the sprocket is revolved in a forward direction the eccentricity of the parts causes them to bind and makes the hub revolve with the sprocket. In order that the same effect may not be obtained by back pedaling or by discontinuance of pedaling a segmental slot is cut in the periphery of the eccentric hole in the brake shoe and a stud projected from the eccentric surface of the sprocket hub so that the action of the eccentric device is limited. The

back pedaling brake part of the mechanism comprises face ratchet teeth upon the outer side of the sprocket which engage similar teeth in a loose ring mounted upon the outer extremity of the locking ring attached to the hub barrel. The loose ring also has a series of ratchet teeth upon its outer side which engage

corresponding teeth on the inner face of a disk rigidly attached to the rear fork end or to the axle of the bicycle. The directions of action of the two sets of ratchets are opposite and so disposed that when the sprocket is revolved backwardly, as in back pedaling, it pushes outwardly the loose ratchet ring because of the inclination of the long sloping sides of the ratchet teeth until it engages and is held by the teeth of the rigid disk. Further back pedaling then moves the sprocket inwardly along the hub barrel till it pushes the brake shoe over against

the peripheral disk secured to the hub, thus braking the rear wheel of the bicycle.

Both in the action of the driving clutch and in that of the braking ratchets the inventor has relied upon the direction of rotation of the rear sprocket to return the parts to their normal positions.

### Paterson Dealers Veto a Show.

There has been some talk of a bicycle show in Paterson, N. J. It was the intention to get the members of the local cycle board of trade, which includes every bicycle dealer in the city with one or two exceptions, into the scheme. But the latter refused. Now those who have the matter in hand are trying to induce out-of-town dealers and makers to exhibit. What success they will have remains to

be seen. H. M. Quick, president of the cycle board of trade, says that under no circumstances would the members of the board go into the deal. The board was organized to promote bicycling and the interests of the dealers, not to make money. It has been the intention of the members to give a bicycle show in this city, but not this year, as they are not ready. Mr. Quick says the local dealers are not at all alarmed at the idea of other dealers exhibiting.

### PROSPECTS IN NEW YORK

Dealers Are Booking Heavy Orders for Early Delivery and Expect to Do a Big Business.

New York City, Feb. 28.—It is the prevailing opinion in this city that the retail business for the coming season will rival, if it does not considerably exceed, the banner season of 1896. More orders are being taken for immediate delivery than ever in the history of the trade at this season of the year.

One of the leading dealers who has taken space at the dealers' exhibition which will be held in this city in the last week of this month, remarks in connection with the approaching show:

"I believe the first annual cycle dealers' exhibition will prove a satisfactory success, and that many of the exhibitors will do business enough in immediate sales to pay all their expenses and more. I was, with an exception or two, I believe, the only dealer who had the temerity to exhibit in the show in January at the Madison Square Garden, and although the buying season has already opened, am more than satisfied with results. I am glad that I was undeterred by the fact that some of my friends in the ranks of the retailers smiled at my announcement that I would appear among the manufacturers."

### Forthcoming Exhibitions.

Cycle dealers in Boston are now planning a local show and have secured an option on the Mechanics' building for the week of March 23 to April 1. The show will be for the benefit of the '99 L. A. W. meet and will be managed by Charles Ducker, manager of Charles River Park track, and S. J. Byrne.

The Triangle Bicycle Club of Davenport, Ia., proposes to hold a small bicycle show about the middle of March, charging exhibitors a nominal fee for floor space.

Dubuque, Ia., will have a local show under the auspices of the Y. M. C. A. on March 9 and 10. A number of dealers have agreed to exhibit their goods and assist in making the show a success.

A general opening of the retail stores of Lynn, Mass., occurred on February 23, Washington's birthday.

### Gold-Bricking the Country Editor.

And now doth the foxy bicycle dealer take his pen in hand and write to his friend in the country—the editor—offering him a twenty-dollar wheel for only thirty dollars in cash and forty in advertising.—Goodland (Ind.) Herald.

At a meeting of the cycle board of trade of France held February 9 in Paris it was announced that the Paris cycle show realized \$8,000, allowing 68 cents per square meter to each exhibitor and the return of the guarantee capital with 40 per cent profit.

The measure of damages for a breach of warranty is the difference between the contract price, paid or to be paid, and the market value at the time and place when delivered.

# Current Cycle Manufacture

In the following table, which will be continued in subsequent numbers of THE CYCLE AGE, will be found an amplification of that class of information which is customarily given in catalogues issued by makers of bicycles, saddles, bells, lamps, chains, rims, cyclometers, etc. It will serve as a handy reference for dealers.

## DEALERS' SPRING DISPLAYS

### Washington Cycle Show Opens—Successful Denver Exposition—Opening Day in Boston

Washington, Feb. 27.—Pleasant weather marked the opening of the cycle show here tonight. The show is being held under the auspices of the Bicycle Show Co., composed of the leading bicycle dealers of this city, and is the largest affair of the kind ever undertaken by the local trade. The attendance on the opening night was remarkable, the immense hall being packed, and from the interest evinced the show will undoubtedly have a very beneficial effect upon the local trade. Special features have been provided for the entertainment of the visitors, among them being an address on the hygiene of the bicycle by Dr. Mary Walker, the noted reformer and advocate of man's apparel for women.

At no previous show held here has there been such a representative showing of bicycle lamps. Those of the acetylene gas variety are attracting a great deal of attention and judging from the numerous inquiries the sale of these lamps will be large here during the coming season.

#### Exhibitors and Displays.

Following is a list of the exhibitors:

- West End Cycle Co., Washington—Andrae and Keating bicycles.
- Clowes Mfg. Co., Waterbury, Conn.—Calcium King lamps.
- Henry Boyd, Washington—Collins pneumatic hub bicycles.
- Jones & Fellows, Washington—Olive, Envoy and Fleetwing bicycles.
- W. D. Hadger, Washington—Orient bicycles.
- J. D. Lasley, Washington—Eclipse and Corona bicycles.
- John Woerner, Washington—Quaker bicycles and sundries.
- Miller Bros., Washington—Wolff-American, Warwick and Relay bicycles.
- The Cycle Syndicate, New York—Cycle specialties, Rusch saddles and Excelsior lubricant.
- P. Von Boeckman, Washington—Viking bicycles and sundries.
- Taylor Mfg. Co., Washington—Kankakee bicycles.
- R. M. Dobbins Co., Washington—Monarch and Barnes bicycles.
- Pope Mfg. Co.—Columbia and Hartford bicycles.
- W. B. Morgan & Co.—Victor bicycles.
- Gormully & Jeffery Mfg. Co.—Rambler bicycles.
- Western Wheel Works—Crescent bicycles.
- Saks & Co., Washington—Spalding and Saks Flyer bicycles.
- Carpenter Cycle Co., Washington—Sterling and Featherstone bicycles, Morse chains, Veeder cyclometers, Solar lamps.
- Cleveland Cycle Co., Washington—Cleveland bicycles.
- D. N. Walford, Washington—Stearns and Stormer bicycles.
- Washington Cycle Supply Co.—Tribune and Lyndhurst bicycles; Brown, Hunt and Garford saddles.

- Rose Mfg. Co., Philadelphia—Neverout lamps.
- W. E. Baum & Co., Washington—Hoffman and Clipper bicycles.
- Hartford Rubber Works—Hartford tires
- Higham & Co., Washington—Tiger bicycles.
- LeFevre Mfg. Co., Philadelphia—Bicycle specialties.
- Automatic Seat Post Co., New York—Seat posts.
- Stee Leech Saddle Co., New York—Ball bearing bicycle saddles.
- J. Karr, Washington—Calcite lamps.
- Bundy Lamp Co., Elmira, N. Y.—Bundy acetylene lamps.
- United Specialty Co., New York—Automatic tire inflators.
- F. G. Smith, Washington—Remington bicycles.

#### VISITORS IN EARNEST

General Opening in the Hub Marked By Absence of Old "Hurrah Boys" Spirit.

Boston, Feb. 27.—A saunter up Columbus avenue last Friday would have disproved to the satisfaction of almost any pessimist that interest in cycling is waning. It was general opening day among the cycle dealers, among whom it was the unanimous opinion after the day was over, that riders and prospective customers are more enthusiastic and more anxious to learn details of construction than ever before.

There were more actual buyers than on February 22 last year, which is a sure indication that the trade this year will be substantial. In many cases, dealers in bicycles who took no orders on opening day last season booked many Friday. It is an axiom in the business that, as goes February 22, so goes the year, and none but rejoiced at the spirit of interest shown by the thousands of visitors.

Boston is unique among cycling cities in that opening day is always religiously observed by the wheelmen by a pilgrimage to the cycle stores. There was a conspicuous and agreeable absence this year of the exuberant display of club spirit.

Said one manager of a leading store: "The crowd this year is different. They really want to know about our line. There is an absence of the hurrah boys style of visiting, and the people ask sensible questions. They are searching for the best machine for the money, and when they find it they will buy it. Last year we did not get a single order. Today at 2 o'clock we had a dozen."

The same opinion was expressed all

along the line. Each dealer reported a vastly increased practical interest and a greater willingness to buy. The dealers, too, had their work better in hand. At every store it was possible for the visitor to learn something new about bicycles.

A great deal of interest and curiosity was manifested with regard to the chainless machines wherever they were to be found and of whatever type. Racing men perambulated in crowds along the avenue and drifted into stores not on the "row." The crowd visited downtown stores in large numbers and did not slight the tire and sundries houses.

Altogether, opening day for '99 was a decided success from all points of view and dealers are well pleased.

#### THE DENVER SHOW

Unique Offer of Free Space Secures Complete Representation of Local Dealers.

The Denver bicycle and automobile show promoted and managed by G. A. Wahlgreen, of the Cycling West, was eminently successful from all points of view, despite the unusual and adverse weather conditions that prevailed. The offer of free space made by the promoter in the interest of the local tradesmen was unusual enough to secure the cordial support of trade and public alike. The exhibits and exhibitors comprised every dealer in that section and every cycle, cycle sundry, accessory and apurtenance ever introduced in the western market. The attendance was surprisingly large considering the abnormally vile weather and the pecuniary returns far surpassed the most sanguine expectations of the managers, who now claim the distinction of having held the first and only successful cycle show at which absolutely no charge was made to exhibitors.

All the factors of success were involved: merit in the quality and quantity of exhibitors and exhibits; satisfactory results to patrons and the public; and success, artistic, commercial, diversional and pecuniary to all concerned. The exhibits were high grade, the booths artistic and beautiful, and everything was harmonious and pleasant. There was rivalry, spirited and aggressive, but all of the kindest and most generous nature. It was the wholesome kind that always characterizes clean, honorable business methods and honest competition.

The automobiles proved a big drawing card. It is safe to say that no one other locomotive device since the days of the old high wheeled machine has aroused so much interest and curiosity as have the horseless carriages shown at the Denver exhibit.

That Denver is on the eve of a business boom is conceded by all practical observers. In the cycle business is this espe-

cially apparent. Local dealers are stocking up heavily in anticipation of a lively demand and nothing but optimism is encountered in making the rounds. That the eastern manufacturers are cognizant of and appreciate these conditions is shown by the fact that they are eager to enter this field and a number of them have made initial connections in accordance. Dozens of makers who heretofore have disregarded the West in this respect have now secured representation there and are consigning largely in anticipation of the good times ahead.

The exhibiting firms and what they displayed are given in the following list:

- E. B. Brandt—Hartford tires.
- Felker Cycle Co.—Cleveland and Sterling bicycles and Goodrich and Palmer tires.
- Daniels & Fisher—Stearns, Andrae and Crawford bicycles.
- Gougar & Todd—Wolff-American, Deere, Fawn and Moline bicycles.
- Geo. J. Charpiot—Clipper and Charpiot bicycles.
- N. R. Blatherwick—Outing bicycles and Picard valves.
- Alpha Lamp Co.—Acetylene lamps.
- Snell Cycle Mfg. Co.—Snell bicycles.
- C. W. Fowler—Pueblo bicycles.
- Hart Bros. Sewing Machine Co.—Crescent, Phoenix and Silver Serpent bicycles.
- Fawkes & Co.—Dayton and Silver Serpent bicycles.
- Geo. Mayer Hardware Co.—Imperial bicycles.
- Denver Dry Goods Co.—Orient, Luthy, Denver and Earl bicycles.
- Joslyn Dry Goods Co.—Monarch, Olive, Defiance, King and Queen bicycles.
- Schultz & Co.—Samples of enameling.
- Colorado Cycle Supply Co.—Cycle fittings and accessories and photographic supplies.
- Relay Wheel Co.—Manson, World, Hamilton and Lee bicycles.
- E. R. Cumbe—Rambler and Ideal bicycles and G. & J. tires.
- C. G. Fisher & Co.—Racycle, Pierce, Envoy and Fleetwing bicycles.
- A. G. Spalding & Bros.—Spalding and Nyack bicycles and Christy saddles.
- E. T. Welant—Victor and Elfin bicycles, Kokomo tires and cycle sundries and supplies.
- Gano Cycle Co.—Columbia, Hartford and Vette bicycles.
- Silver State Cycle Co.—Silver State bicycles, India tires, Gordon saddles, Velox pedals, etc.
- Trinity Cycle Mfg. Co.—Trinity bicycles.
- A. T. Wilson—Featherstone, Viking, Remington, Union, Eldredge and Patee bicycles.
- Mrs. F. W. Baxter—Ladies' cycling costumes.
- Geo. E. Hannan—Crescent bicycles and Dunlop tires.
- Boston Woven Hose & Rubber Co.—Vim tires.
- Black Mfg. Co.—Tribune bicycles.
- American Electric Vehicle Co.—Motor vehicles.

**Cleveland Opening a Success.**

The general opening of the cycle stores in Cleveland under the auspices of the cycle board of trade closed last Saturday. It was the most successful and generally satisfactory display of goods and public reception ever offered by the dealers. All day Saturday throngs of visitors crowded the different stores and could hardly be accommodated, notwithstanding the special preparations that had been made. There was music all day. Many out-of-

town dealers and buyers were present all the week and Cleveland dealers are unanimous in declaring that they have done more business and entertained larger crowds at a smaller expense this year than ever before.

**STIMULATING EARLY TRADE**

New England Dealers Interest Buyers by Joint Exhibitions—Co-operation of Y. M. C. A.

Springfield, Mass., Feb. 27.—Agents in many of the larger towns in New England have held, or will hold, local shows to stimulate spring trade. Shows which are run primarily to put a few dollars in the pockets of some enterprising dealer, who collects sufficient rentals from spaces to pay all expenses, and then salts down the gate receipts, have not been well supported in New England since the first craze over cycle shows subsided. The most successful shows have been those in which the exhibitors shared the expense jointly. In several cities the Young Men's Christian Associations have given the use of their halls free and allotted spaces to bicycle agents, who were under no expense other than the cost of setting up their exhibits and providing attendants. Catalogues, buttons and inexpensive souvenirs are given away. The general public has been quick to recognize that such shows are as much for the benefit of the purchaser who is undecided as to his mount as for the agents. The shows also afford the dealers opportunity to become better acquainted with one another, thus opening the way to the adoption of business methods which are of mutual advantage to members of the trade.

Agents in Springfield, Worcester, Hartford and other retail centers report a larger inquiry concerning bicycles than a year ago. The larger houses have as a rule already sold bicycles in small numbers for delivery as soon as riding is practicable. The chainless is in greater favor than a year ago. General business conditions in New England are the best since 1894 and the cycle trade is correspondingly cheerful.

**PHILADELPHIA AGENTS PLEASSED**

At Their Show Many Orders Were Booked—Automobiles Absent on Account of Weather.

Philadelphia, Feb. 28.—The local cycle show terminated brilliantly last Saturday night with the banner crowd of the week, estimated at upwards of 7,000. The smallest attendance was recorded for the opening night, the turnstile registering but little over 1,600. But notwithstanding this inauspicious beginning the show was a huge success in every respect, the total admissions being within a couple of

thousands of those of the '97 and '98 shows, when there was a rake-off for the stockholders of upwards of 300 percent, besides which about \$2,000 went into the local cycle board's treasury.

From a business standpoint this year's show was even more successful than others, almost every exhibitor reporting numerous sales, in many instances the resulting profits more than making up for the outlay.

The one feature that marred the show from the promoters' viewpoint was the inability to secure the automobile exhibits, thus compelling them in a measure to break faith with the public. On Thursday night, however, a solitary electric automobile put in an appearance and remained on exhibition for the remainder of the week. In this connection it is related that when it became apparent that the automobile end of the show was to be a failure President Brewster telegraphed the Orient people for permission to exhibit the automobile which formed part of Wanamaker's bicycle exhibit. The necessary permission was given, but Wanamaker's manager refused to let the machine go. The next day the last-named gentleman asked for permission to exhibit Major Taylor and his world's record machine. But Brewster declined.

Gus. Tubeman, a relic of the first cycle show ever held in this country, made throughout of Shelby steel tubing of various sizes worked up into the shape of a man, reappeared. He was stolen after the first show by the Century Wheelmen, of this city, in whose possession he still remains. Many vain attempts have been made by the Shelby company to recover possession of "Gus." In his journey from the Century club house to the show building last week he was stolen by two different gangs of marauders, and was "safely" hidden away by each in turn. But the show managers got a clue to his whereabouts somehow, and he made a triumphal entry into the building on Thursday night escorted by a brass band, his equipage being a "horseless sleigh," an old sleigh shod with roller skates and drawn by a pair of rules.

**Retail Trade Transfer.**

Edward C. Rehfield of Horicon, Wis., has bought out the bicycle stock of Louis Dietz of the same place, and also his father's sewing machine and hardware business and will open a cycle store and repair shop. Dietz will devote his time to his hardware business.

The exports of bicycles and parts from Belgium during the past three years are reported as follows: 1896, \$334,722; 1897, \$484,195; 1898, \$517,061. The imports in 1896 were \$637,307, while in 1898 they were only \$379,101.

## SUBJECTS OF GENERAL INTEREST

### PHILOSOPHER DOOLEY'S DILEMMA

"I know what I'd do if I was Mack," said Mr. Hennessy. "I'd hist a flag over th' Ph'lippeens, an' I'd take in th' whole

lot iv thim."

"An' yet," said Mr. Dooley, "'tis not more thin two months since ye larned whether they were islands or canned goods. I've been r-readin' about th' counthry, full iv goold an' precious stones, where th' people can pick dinner off th' trees, an' ar-re starvin' because they have no step-ladders. Th' inhabitants is mostly naygurs an' Chinny-men, peaceful, industhrus an' law-abidin', but savage an' bloodthirsty in their methods. They wear no clothes except what they have on, an' each woman has five husbands an' each man has five wives. Th' r-rest goes into th' discard, th' same as here. Th' islands has been ownded by Spain since before th' fire; an' she's threated thim so well they're now up in ar-rms again her, except a majority iv thim which is thurly loyal.

"Th' natives seldom fight among themselves, but whin they get mad at one another they r-run-a-muck. Whin a man r-runs-a-muck, sometimes they hang him an' sometimes they discharge him an' hire a new motorman. Th' women ar-re beautiful, with languishin' black eyes, an' they smoke see-gars, but ar-re hurried an' incomplete in their dhress. I see a pitcher iv wan th' other day with nawthin' on her but a basket of cocoanuts an' a hoopskirt. They're no prudes. We import juke, hemp, cigar wrappers, sugar an' fairy tales fr'm th' Ph'lippeens, an' export six-inch shells an' th' like. I learned all this fr'm th' papers, an' I know 'tis sthraight. An' yet, Hinnissy, I dinnaw what to do about th' Ph'lippeens. An' I'm all alone in th' wuruld. Ivrybody else has made up his mind."

### POSSIBILITIES OF HOUSE COOLING

Nowhere in the world has so much thought and energy been applied to the perfecting of methods of heating dwelling houses

as in the United States, and the people here are probably the best warmed people of any in a similar latitude on the face of the globe. For relief from the extremes of hot weather, however, says the Metal Worker, very little has been done here, and, in fact, it is by no means certain that there is a feasible method of cooling small houses.

The matter has been given somewhat more attention abroad, and an interesting paper was presented at a recent meeting of the Heating and Ventilating Congress in Munich by Dr. Bruckner, who explained that the most feasible means of cooling were through ammonia or carbonic acid, which took up heat as they expanded. He likened ammonia to a sponge, which, expanding in a warm atmosphere, took up the heat, which could be thus carried away and squeezed out of the ammonia by compression outside. The same thing is true of carbonic acid, though ammonia was preferred as being cheaper to work and also in case of leakage being instantly detected. In operation the ammonia gas is compressed in a machine and cooled, and thus brought into liquid form. On being allowed to expand it falls to a very low temperature, and may then be used either direct as a cooling agent or through the medium of

salt water. For ordinary house cooling ribbed pipes through which the cold liquid is passed are used. Machinery is required, of course, to accomplish these several ends of compression and distribution, and this is an almost insuperable objection to the employment of such a method in a private residence, except in those palatial ones which include power plants for elevator service and lighting.

Dr. Bruckner described, however, one house in Germany which had a regular system of cooling operated by a three horse-power electric motor. The house was in Frankfort, and the system has been working for five years, salt water being cooled and carried through pipes in the ceilings of the dwelling rooms, the ceilings being perforated with narrow slits through which the air as it was cooled fell into the room. Being an electric motor it was easily handled, and, in fact, the only attention given to it was by the woman cook. The whole apparatus cost about \$5,000, and the power for running it was estimated at about \$75 a year. The smaller charges incidental to the machinery were not included.

### GERMANY'S UNFAIR REMONSTRANCE

A good deal of unnecessary anxiety is exhibited both in Germany and in the United States over the trade relations between the two countries. The supposition that American trade in Germany, or German trade in America, is being disturbed or depressed by existing conditions seems to be unfounded. Certainly the United States is giving to Germany a larger percentage of her import trade than ever before, and is selling to Germany a larger percent of her exports than ever before. American exports to Germany increased over 11 per cent in the past six months compared with the corresponding six months of the preceding year, which of themselves were phenomenally large. And the imports from Germany into the United States in the past six months were nearly 25 per cent greater than those of the corresponding six months of last year.

The share of our import trade given to Germany has steadily increased during the past decade, as has also the share which she takes of our exports. A decade ago 10 per cent of our imports was taken from Germany, while now 13 per cent comes from that country; a decade ago 8 per cent of our exports went to Germany, now over 13 per cent goes to that country.

### MOTOR CARAVAN FOR TOURING

Since the days of Diogenes and his tub, our world has seen many changes. We call these changes progress—civilization—and yet there are those among us whose tastes bend backwards and aim at simplicity of life. In the matter of housing, this is particularly noticeable. One of the English nobility, owning several palatial dwellings, finds his greatest pleasure in touring about the country in an ordinary gipsy caravan. That this is a healthy life we may take it as proved by the fact that a well-known medical writer has for years taken extended tours in a vehicle of similar if somewhat improved type. This latter instance can hardly, perhaps, be quoted as an example of simplicity, inasmuch as the doctor carries with him a coach-

man, a valet, a tricycle, a tent, and a very large dog.

The introduction of the motor car has led to the construction of what may be called an up-to-date caravan, or motor-caravan. One of these vehicles is in use by a Russian prince, and another has just left the builder's works and can be purchased for the sum of \$6,000. This moving house consists of two bedrooms, convertible into one living room by day, bath-room, and lavatory, and kitchen; the larder is under the floor, and on the roof are the water tank and coal "cellar," for the motive force is steam in this case. The tractor, which is to drag this somewhat elaborate house, develops thirty horse-power.

### GLASS USED FOR STREET PAVING

In a French town glass, in devitrified form, is used for street paving. For four months it has stood as hard usage as any pavement could be subjected to and is still in an admirable state of preservation. The glass, or ceramic stone, pavement is laid in the form of blocks, 8 inches square, each block containing sixteen parts in the form of checkers. These blocks are so closely fitted together that water can not pass between them, and the whole pavement looks like one large checkerboard. Like all thoroughfares in France, the roadbed slopes gently to the walk on each side. Some of the edges of the checkers have been slightly chipped, during their service, on the edges, but this does not argue against the value of the material as a pavement, or that any kind of stone would not have suffered just as much or more in the same time.

The advantages attributed to this ceramo-crystal by the manufacturers are: As a pavement, it has greater resistance than stone; it is a poor conductor of cold, and ice will not form upon it readily; dirt will not accumulate upon it as easily as upon stone, and it will not retain microbes; it is more durable than stone and just as cheap.

On careful examination, it is found that the ceramic stone is nothing but glass brought to a special molecular condition. In a certain sense, it constitutes a new substance which resembles flagstone, granite, or marble. This new product is obtained from broken glass heated to a temperature of 1,250 degrees and compressed by hydraulic force. The phenomenon of devitrification produces a sort of dissolution more apparent than real; for, upon chemical analysis, the devitrified glass preserves the identical composition of natural glass. It may be said, then, that devitrified glass possesses all the intrinsic qualities (physical and chemical) of glass, except the transparency, while taking on an entirely different aspect.

A bicycle recently shipped to Cheefoo, China, was found upon unpacking to be completely covered with rust, and the front tire full of cracks. The machine had to be sent to Shanghai for a new tire, costing about \$24 Mexican; the machine in the first place cost only \$140 Mexican. Here was an addition of \$24 before it could be used, besides the loss of its use for five weeks, due entirely to the carelessness of the shippers.

A sporting goods exhibition arranged exclusively for the trade is to be held in Paris from March 3 to 17. It will include bicycles and motor vehicles.

## MONTREAL AGENTS ARE HAPPY

### MACHINES BRING LARGE PRICES

The Reduction in Lists Will Have a Strong Tendency to Stimulate the Demand.

Montreal, Feb. 28.—A tour of the principal cycle stores was made last week and it was found there was a hopeful feeling for the coming season—in some cases much gratification with the number of orders already received, which are far in advance of the same period of '98. The sales, however, will have to be fully one-fifth as large again as last year in order to attain the same result in gross values, as prices for the standard makes have been practically cut down 20 percent and even more in some cases. This reduction will undoubtedly create a demand for the bicycle among people who hitherto have been debarred from purchasing on account of high prices. That the increase will amount to more than 20 per cent. is a question which it is yet too early to speak of with any degree of decisiveness.

#### Slight Alterations in Models.

The chain machine will be the one generally pushed in this locality, although dealers handling the chainless look for good sales of it. So far as the chain driving models are concerned, there is but little change from last year in general outline and appearance, the improvements being merely in the bearings, spokes, handle and saddle clampings, and adjustment. There is no considerable change in the tubing, it being slightly heavier in some cases and in others remaining as formerly. The low frame which was so conspicuous last year will be but little seen this year. The gearing will average about 77, with a fair demand for higher. The tread will be narrower, the chains run at 3-16 and 1-4 inch. Adjustable handle bars are features. Simplicity in finish is looked for, and black will certainly be the predominating color.

#### Single Tube Tires in Favor.

It was claimed last year that the quality of rubber both in the single and double tube tires, particularly the former, was not so good as in 1897, and frequent complaints were made. Small blisters would raise on the tube, and after bursting would leave those particular spots extremely weak. Rubber this year has advanced in price, and there is a slight tendency on the part of tire companies to increase their price, but owing to severe competition it is unlikely they will be able to maintain such an increase. Single tube tires found favor last season, and dealers look for a big demand for them.

#### CHEAP Bicycles not wanted No. 6)

In past years there has been a marked objection to bargain counter bicycles. Unlike the riders of other cities, the Montreal cyclists look askance at anything below \$40 or \$50, and there have been exceptionally few cheap American machines sold in this district. The same condition of things is likely to prevail this year.

Local civic regulations will create a good call for bells and lamps. It is believed that electric lamps will find a ready market. As yet nothing of a satisfactory nature in such a sundry has made its appearance.

#### Saddle Spring for All Weights.

A saddle spring which offers the same proportional amount of elasticity and comfort for a light rider as for a heavy

rider is the recent invention of S. A. Bailey of New York city. The construction of the spring is shown in the accompanying illustration. It comprises in effect three members though it may be made from two pieces of flat spring metal or even from one. The uppermost portion is horizontal and is given a downward curve from each end toward its center. The middle section is a straight obliquely placed bar running from the front of the top member to the rear of

the bottom member which is similar in its curve to the uppermost but with its convexity reversed.

When the rider mounts the saddle the curved face of the uppermost member increases its area of contact with the inclined bar and the upper curved face of the lowermost member correspondingly increases its area of contact though from the opposite end of the middle section. This increased contact tends to stiffen the spring, thus giving each rider an amount of elasticity dependent upon his weight.

#### English Mechanical Joint.

To William Fraser of Birmingham, Eng., has been granted a United States patent on the brazeless joint shown in the accompanying illustration. The hole in the lug branch is bored tapering with the smallest diameter at the outer end. A tapered thimble matching the taper in the lug hole but enough smaller to admit between the two, when the ferrule is in place, the frame tube, is placed in the lug socket and rests upon the shoul-

der at the bottom of the taper boring. The end of the frame tube is enlarged but does not taper. It is instead split in several places for a short distance so that it is expansible and is driven into the lug between the thimble and wall of the branch till the curve connecting the large and the small diameter abuts against a corresponding curve in the thimble. The ferrule is supposed to be heavy so that the tube after having been driven into the lug will not have contracted it but instead have been expanded itself, and will bind against the wall of the lug. The finishing operation is to spin over the end of the lug thus effectually preventing the withdrawal of the tube.

In St. Petersburg there are but 15,380 cyclists among a population of 1,267,623, 139 of the riders being women.

The differences between the C. H. Sieg Mfg. Co. of Kenosha, Wis., and its employes have been settled.

A tax of 80 cents is to be levied on every bicycle used in Holland.

## GEAR OF CHAINLESS MACHINES

### SEVERAL WAYS OF FIGURING IT

With Two Persons to Count Simultaneously There is no Need of Figuring—Other Ways.

An inquirer desires to know how gear of chainless bicycles is computed.

Multiply number of teeth on driving gear by number of teeth on rear shaft pinion and multiply the product by the diameter of the rear wheel in inches—usually 28. Divide the product by number of teeth of front shaft pinion and divide the quotient by number of teeth of hub pinion. The result is the figure of the gear.

Commonly the computation may be simplified by crossing off some of the figures, as when the front and rear shaft pinions have the same number of teeth. Then the gear is found like that of a chaindriven machine, by considering driving gear as front sprocket and hub gear as rear sprocket. Or, if rear shaft pinion is like the hub pinion, they may both be left out of consideration.

In general it is simplest to place the three factors above a line and the two divisors below and cross out according to the usual school rules.

#### Without Counting Gear Teeth.

In order to determine the gear without removing gear casings or counting teeth, hold one pedal crank vertically; mark the highest point on rear wheel tire; turn the crank one revolution till it is vertical again; note how many times the rear wheel revolves. This is usually two times and a fraction; rarely three times or more. Measure the outer circumference of tire with a string. Measure also the distance from the highest point to the mark showing where the highest point was before. The circumference is usually close to 88 inches. If the other measurement is, say, 20 inches, multiply diameter of wheel—28 inches—with 2 20-88. The product is the gear; in this case 62 4-11. If the rear wheel has revolved three full revolutions the figure should of course be 3 20-88, making the gear 90 4-11.

For ordinary purposes take it for granted that circumference of rear tire, inflated, is 88 inches; measure from last high point to mark as before, lump the fraction by reducing it to sevenths. For example, if measurement shows 50 inches—always measuring the way the wheel revolves—call the fraction 4-7.

Any fraction of 88 inches can be conveniently reduced to sevenths by multiplying the measurement by 2 and dividing by 25. And sevenths are convenient for multiplying by 28 afterwards. In this case with the measurement 50 inches, the gear is thus found to be 2 4-7 multiplied by 28, making 72.

With three revolutions and a measurement of 12 inches, the computation would be: 2 times 12 inches 24; divided by 25 is very nearly 1, which is 1 seventh. Hence multiply 3 1-7 by 28; result 88 gear.

#### Quickest and Simplest Way.

If it is desired to avoid figuring as much as possible yet get very close to a correct result, the following method may be used. Mark a spot on the wheel rim or tire. Revolve pedal crank twenty-eight times and count the revolutions of the rear wheel by noting the marked spot as it comes around. The figure of the count is the gear.

With 30-inch wheels revolve crank 30 times. This is applicable to chain-driven bicycles as well.

The German reichstag has voted \$31,250 for the purpose of experimenting with

motor vehicles for the transportation of ammunition and materials for the army. Seven vehicles have been ordered for the purpose.

## SUSPENSION CYCLE FRAME

Designed to Receive Only Tension and Compression Strains—Bending Stresses Obviated.

The suspension frame idea has been struggling for existence in some modified form or other ever since the diamond safety frame became popular. Its latest advocate is one C. W. Atkinson of Penarth, Eng., whose frame, on which he has obtained a patent in this country, is shown in the illustrations herewith. Mr. Atkinson's primary reasoning is logical in a general way as it is not new but comprises merely the old idea that if a frame could be so built that the different members composing it were subjected only to either compression or tension strains acting in such ways that those members intended by their character to resist tension strains should not receive compression strains and vice versa much weight could be taken from the frame work. He contends that in the ordinary bicycle frame each member at different times, according to the variations in the external forces due to the use of the machine, receives tension, compression and bending stresses and accordingly has to be made sufficiently heavy so that the mere bulk of the member will give strength sufficient to resist these varying strains.

In the illustration the heavy lines are supposed to represent the frame members which this inventor has disposed so that they will receive the compression strains while the light lines represent the members upon which none but tension strains act. The crank hanger, rear wheel and seat post are hung within the compression

frame and supported in a suspension manner by radiating spokes, the strain upon which is tensional. That there may be no bending stresses upon the different members the frame is doubled and the two sections coupled together by cross spokes and short tubes. It is at this point that the inventor's scheme is apt to fall short, for though the frame be made double it is doubtful whether the many twisting strains given a bicycle while in use will take effect solely upon the cross members which couple the two sections together and not to some extent at least exert a bending strain upon the side members intended

only to receive either tension or compression stresses. The invention is not limited to any exact form, several patterns of frames being shown by the patentee. The two illustrated show the construction applied both to a frame resembling in contour the ordinary diamond shape frame and to a frame in which the outside compression member on each side of the double frame is in the form of an ellipse.

The inventor has evidently overlooked one advantage that his frame might have. If he would use tensional spokes within the frame of varying thickness so that they would yield musical chords when picked, a proficient trick rider might, by riding hands off and bowing his knees out to admit his hands between them,

play as on a harp while scorching down the dusty pike or while circling around some creaking vaudeville stage and thus tickle the musical as well as the cycling interest of the onlookers by rendering for their benefit the sweet strains of "She Was Bred in Old Kentucky."

## NEW CHANGEABLE GEAR

Two Sets of Sprockets and Chains Used—Gear Can Be Shifted While Riding.

While there have been invented many changeable gear devices during the past few years the mechanism here illustrated represents practically a new type, but one which is primarily of such a simple nature that it is to be wondered why inventors have not attempted such a scheme before. The main principle of the gearing is the employment of a set of sprockets and a chain on each side of the bicycle, one set affording a high and the other a low gear. The gear is changed through the shifting mechanism placing either set in driving engagement with the crank shaft according as to which gearing is desired. Thus far the idea of the invention, while it necessitates added weight on account of the addition of two sprockets and a chain, presents certain possibilities of simplicity and durability which are attractive to those who believe in changeable gears but have failed to find what they want.

The two front sprockets are mounted, each between two ball bearings, one in the bracket and one on the crank shaft so that they are free to rotate on the shaft, and the sprocket hubs have inner extension sleeves upon the shaft which are notched at their inner ends to match notches and projections cut in the ends of a central collar which is connected by spline and pin to the axle so that it may

slide lengthwise upon it but is fixed to rotate with it. A U-shaped yoke of stout wire is mounted near the bottom of the seat mast tube with one of the branches pivotally connected to the inner wall of the tube and the other fitted with a knob, or preferably with a roller, which travels around an annular groove cut in the collar splined to the axle. The pivoted yoke is turned by a shifting rod in the form of a flat spring running up-

ward through the seat mast to a point near the top of the latter where it is secured to a horizontal latch which projects through a slot in the seat mast tube. By turning this latch the shifting rod is correspondingly turned and the sleeve on the axle moved either to the right or to the left, thus bringing it in engagement with the slotted end of one or the other of the sprocket hubs and causing that sprocket to rotate with the crank shaft and so drive the bicycle. Notches in the slot for the passage of the hand latch through the seat mast permit the gear to be locked in either position or in an intermediate position at which the collar is disengaged from both sprocket hubs, as for coasting.

Though the construction of this mechanism might be much improved and while the horizontal slotting of the seat mast materially weakens that frame member, it presents an interesting effect on new lines suggestive of new thoughts especially for those who might desire to incorporate a changeable gear in a bicycle with built-in gear cases on both sides. The inventor of the gearing is W. A. Tickner of Marshall, Wash.

RECENT CYCLE PATENTS

Tool Holder With Universal Adjustment—Penseyres' Hanger—Vose's Handlebar.

Adjustable Handle Bar.—The bar is adjustable without the use of a wrench or tools and may be raised or lowered while

the rider is on the bicycle. An annular worm gear extends around the center of the bar, the latter turning in the cylindrical head of the stem tee. A cross worm whose spirals engage the teeth in the worm gear is mounted in the stem di-

rectly underneath the bar and is maintained in a readily rotatable position by a bolt which passes through the central hole bored in the worm. The head of the worm and a nut abutting against its forward end keep the worm from slipping longitudinally on the bolt. A set screw locks the bolt tightly in place. The adjustment of the bar is effected by turning the worm by means of its thumb nut. The only locking of the bar after adjustment is the resistance of the worm to turning unless actuated by the thumb nut. The inventor is A. M. Vose of Brookline, Mass.

Lathe Tool Holder.—The holder is designed for holding the cutting tool at any desired angle and to allow the cutting of both right and left hand threads without changing tools. It allows the tool practically a universal movement with regard to the work to be operated upon. The securing of the tool is also more sure than with the ordinary tool holder in which the tool is clamped merely with a set screw. The shank of the holder is forked at the forward end and bored transversely for the passage of a cross bolt on which two knurled washers are placed between the fork blades. Through the center of the cross bolt a transverse slot is cut for the passage of the cutting tool and it is made large enough to receive cutters of different sizes. The outside faces of the knurled washers are machined at exactly right angles to the cross bolts and are thus parallel to the inner flat faces of the fork blades against which they are adapted to bind. The inner faces, however, are cut at a slight angle to the fork, so that they possess something of the nature of cam surfaces

and allow the tool which is clamped between them to be set at any desired inclination within certain limits. A socket in the shank at the bottom of the fork gives rear end seating for the cutter and aids in keeping it securely in place. The inventor is F. P. Kuhn, of Kearney, Neb.

Two-Piece Hanger Construction.—The inventor has been allowed patents on two hangers each of which is of that type of two-part design in which the shaft is divided in the center, the ends being inclined so that together they form a wedging union against each other and the inner wall of the surrounding sleeve. In that shown in the upper illustration the sleeve is held to the right axle section by a flange on the hub of the sprocket which screws on to a seat adjacent to the inner face of the crank. The opposite end of the sleeve is threaded. The left bearing cone is kept from longitudinal movement on the shaft by an annular row of balls placed between corresponding grooves around the cone and around the axle. The balls are inserted through a radial hole in the axle. The axle sections are drawn together by the cone and after the tightening is sufficiently attained are locked against rotation by a set screw screwing into the hole through which the balls

between the cone and axle were inserted and binding against whichever ball or balls are directly beneath it. In the second hanger the sprocket screws onto the axle and up against the crank face

and is locked by a threaded cone which also holds the shaft sleeve in place, the latter being screwed into it after the cone is in place on the enlarged portion of the axle. The left section of the shaft is smaller than the right and is threaded near its outer end. Onto this threading screws a sleeve inclined at its inner end to match the division between the shaft sections. This sleeve when in place enlarges the smaller shaft section to the inner diameter of the surrounding sleeve and also holds the locking cone from longitudinal movement, an annular flange on the cone being between the outer end of the sleeve and the inner face of the crank. The cone pulls the crank shaft sections together in the same manner as that on the previous hanger. In both patterns the adjustment of the bearings is made by the cups which screw into the barrel and are locked by cross bolts in lugs on the split underside of the brackets. The inventor is W. H. Penseyres of Buffalo, N. Y.

## COMMERCE IN FOREIGN MARKETS

### BICYCLES ARE SCARCE IN MADAGASCAR

Bicycles are not in general use in Madagascar. There are two at Tamatave, owned by Frenchmen. The native has not as yet reached this stage of civilization. The roads about Tamatave are at all seasons of the year nearly ankle deep in sand, rendering cycling almost impossible. There is some talk of constructing a driveway along the seacoast. The country outside of Tamatave is mountainous and intersected by many rivers. The roads at the capital, Tananarivo, are better adapted to the requirements of the bicycle, and there are a few more in use there, among the European population. Bicycles are imported from France. The duty on foreign wheels is 250 francs (\$47.25) per 100 kilograms (220.46 lbs.), besides a municipal tax of 1 per cent of the cost. French bicycles are admitted free.

Tamatave is the principal receiving port on the east coast, as well as the chief port on the island. On the west coast are Majunga, Nossi Be, and Fort Dauphin. Port charges are 5 francs (96 cents) per ton. A recent decree from France has established a bonded warehouse at Tamatave. Goods should be packed and invoices prepared with great care. The slightest mistakes are fraught with serious consequences. The invoices should state the weight of all the parts of the wheel and the total weight, as well as that of the case and material used for packing.

### THE SWISS LIKE OUR BICYCLES

Bicycles are in general use in Switzerland, especially in French Switzerland, Geneva, Lausanne, Zurich, Lucerne, etc. The condition of the roads varies very much; they are not suitable for riding from December until March, owing to the heavy traffic everywhere and to the fact that they are repaved during this period. During the season (which of late has not set in before April) the best roads are found in French Switzerland, Italian Switzerland, and in the Cantons of Aarau, Lucerne, and Basel. They are rather rough in the Cantons of Zurich, Graubunden, and Schaffhausen, where the roads are often cut up by heavy traffic. Half of the roads are hilly, and the cycles have to stand a great strain.

The only bicycles suitable for this country are those with strong rims; thick, nonslipping tires; reliable brakes, spring saddles, and mud guards. This outfit should be made imperative for every wheel imported into this country. In French Switzerland, 1½-inch tires on 28-inch wheels are asked for most, while in German Switzerland, only 1½ and 1¾ tires find buyers.

The receiving port for French Switzerland is Havre and for German Switzerland, Antwerp. There are bonded warehouses in Geneva, Basel, and Schaffhausen.

The majority of cycles are imported from Germany; the United States follows, and then England. The duty on bicycles entering this country is 70 francs per 100 kilograms (\$13.51 per 220 lbs.). In French Switzerland, -20 per cent allowance is made for crating and packing; but in German Switzerland, the duty is charged on the gross weight. Consequently, the crating must be as light as possible, and closed boxes should never be used. It has frequently occurred that more duty had to be paid on the box, owing to its weight, than on the bicycle

itself. It is necessary that the metals be greased before leaving the factory, and that the whole cycle be wrapped in paper (preferably in large paper bags). There is no differential duty favoring certain countries.

All loose parts should be in small sealed boxes inside the crate; but no catalogues, bill of lading, or posters should be inclosed. These should be sent separately, or at least invoiced separately, or else the same duty will be charged as on the bicycle.

The retail prices are from 250 to 500 francs (\$48.25 to \$96.50). The latter are the American and English prices. There is a good demand for a well-built, solid, cheap cycle, but it must be strong and the price low enough to enable competition with the German prices, which range from 300 to 375 francs (\$57.90 to \$72.37). The American bicycle is recognized as the most satisfactory one on the market, but is considered too expensive for most purchasers. The best Swiss, Austrian and German machines cost from 350 to 375 francs (\$64.85 to \$72.37), while the American machine costs 500 francs (\$96.50). It has been found that when American machines need repairing there is a lack of proper facilities and, as this has caused dissatisfaction, their sale has been discontinued in some cases. The only way to reach the local trade is through energetic, capable agents. Last year Germany sent 3,257 commercial agents into this country and the United States sent none. The result was that Germany captured the cycle business and nearly every other line of trade. Circulars sent to Switzerland should be printed in the French and German languages. The usual credit is from three to six months.

If the American machines could be sold as cheap as the German makes, and could be as easily repaired, and if the same effort were made to gain the Swiss market that the Germans have put forth, they ought to be widely sold, as they are the best-liked wheels in Europe. Local competition would not be great, as only 2,400 wheels were manufactured in Switzerland last year.

### ARABIA IS A POOR CYCLE MARKET

The bicycle has not attained the popularity in Aden, Arabia, that it has in many places. Its use is confined almost entirely to the European and American residents. The natives have not adopted this method of conveyance to any great extent, which may be accounted for, as a rule, by their poverty. The conditions of the roads and streets are not such as would attract a wheelman. One main road leading from Aden (camp) to Aden (steamer point), a distance of some 5 miles, is kept comparatively smooth and free from sand; but it is very hilly and in some places, so steep that a cyclist can not ride up. Elsewhere in this section of Arabia, the roads are rough and sandy, and almost three-fourths of the year the monsoon drives such a dust as to add great discomfort to the topographical inconveniences.

There are no domestic manufacturers in Aden, and not even a repair shop. The bicycles in use there are imported from the United States and England, the greater number coming from the United States. There is no duty on bicycles, or repairs for same, in Arabia; but any that may be shipped to Somaliland would be subject to a duty of 5 per cent. This duty would be assessed on goods com-

ing from any country, and there is no differential rate. Aden is the receiving port for southern Arabia and Somaliland. There is a port charge of about 24 cents per each 35 cubic feet, which covers all the landing and port charges. There is no bonded warehouse at Aden.

### CYCLE TRADE CONDITIONS IN SWEDEN

Some time ago the use of bicycles in Sweden was confined to the wealthier classes, but with the introduction of less expensive machines their use has largely increased. In the cities especially, a great many workmen own bicycles. The condition of the roads is pretty fair, but after heavy rains, and especially in the fall and the spring, the country roads get poor. Certain parts of the country are very hilly and the roads more or less rough. As a rule, mud guards and brakes are used.

The shipment of inferior bicycles from the United States seems to have created a demand for the English and German bicycles. A dealer imported 350 bicycles from America; terms of payment, cash against documents. When the machines arrived, it was found upon examination that the inner tubes of the tires were so poor that the least pulling or stretching would tear them. The bicycles were later sold at auction at a great loss to the importer, who was at the mercy of the exporter, the money being already paid. Cases of this kind do great harm.

The English and German exporters give from three to six months' time, and all shipments are allowed examination before being accepted. Bicycles now retail there at prices ranging from 350 to 200 kronor (\$93.80 to \$53.60), and some are even sold as low as 160 kronor (\$42.88) apiece.

There are about sixteen bicycle factories in Sweden. Some of them are small concerns, however, and many buy parts of bicycles from larger factories. Repair shops are numerous. Bicycles are principally imported from England, the United States, and Germany. As to customs duty, there is no discrimination against the productions of any particular country. The Riksdag at its latest session changed the duty on finished bicycles to \$6.70 apiece, and on parts of bicycles to 53 cents per kilogram, which rates are now charged.

The chief receiving port on the western coast of Sweden is Gothenburg. There are also other ports of entry, among which Malmo and Helsingborg may be mentioned. The port charges on bicycles amount to 1 percent of the duty paid, to which should be added about 7 cents warehouse dues for each bicycle. The dues to be paid for bicycles placed in bonded warehouses also amount to 1 percent of the duty.

Bonded warehouses, as such, do not exist. Importers may use their own warehouses. Goteborgs Magasins Aktiebolag, of Gothenburg city, leases storerooms in which goods may be kept under bond until sold or otherwise disposed of. In either case, the goods are kept under the lock and seal of the custom house until the duty has been paid. Upon due notice to the customs authorities, such goods may also be exported to other countries, without payment of duty; but warehouse dues must be paid. In the presence of a custom house official, the owner of the wares may enter the warehouse and take out small samples, give the goods proper care, etc.

# Concentration

**T**HE companies composing The American Saddle Co., having demonstrated their ability to successfully conduct their affairs in an individual capacity, and having combined their capital, brains and facilities, it is but a natural result that this "composite" of the best there was in each, must and will be far more effective in producing the best there is or can be in saddle construction and at the minimum of cost.

The American Saddle Co. unquestionably takes precedence from the moment of its organization, and buyers will be quick to see that their interests will be best subserved by an organization controlling the best facilities and the greatest resources as regards capital and saddle-making intelligence ever concentrated under one management.

## DEALERS WELL PLEASED

### Expect This to Be the Banner Year in Retail Trade— Effect of Reduced List

While the profits on individual sales of bicycles will be slightly reduced, dealers in all sections of the country seem to welcome the reduction of list prices on standard reputable makes this year and predict good results therefrom. One of the probable effects which has not before been suggested is that fewer machines will have to be taken back from riders because of failure to complete their installment payments. The heavy losses due to this common cause should be relatively very small this year, because with the improved industrial and financial conditions of the country generally purchasers will have little reason for evading the few payments necessary to complete the transaction after the first cash payment of \$15 to \$25 on a \$40 to \$50 machine has been made.

Many dealers anticipate that the trade this season will be better so far as actual profits are concerned than any that has gone before, and, while immediate buying by the dealers from the makers does not go far toward warranting this belief, there is rather reason in this for indulging the opinion than for apprehension, as it is one of the evidences that the dealers as well as the manufacturers have learned caution by experience and are buying conservatively. They have reason for supposing that factories will be in position to make prompt shipments, and they prefer to not overstock themselves.

Following are additional expressions of opinions of agents located mostly in the north central states:

#### Anticipates a Banner Year.

We think the bicycle trade will be better this year than ever before, partly because of the lowered prices. Dealers are buying more freely than we have ever known them to do.

Indiana.

FEETER BROS.

#### Lowered List a Stimulant.

We think the sales will be greater this season because the use of bicycles is becoming more general. Lower prices will certainly stimulate the demand. I do not think the dealers are buying yet; in fact, the only dealers here are agents of standard makes who sell from samples.

Indiana.

HUNTER BROS.

#### Will be the Banner Year.

The sale of bicycles in this suburb of Chicago will be greater this season than last, as there is more money in circulation. The lowered list prices will enable those people to purchase who have not felt that they could pay \$50, but might pay \$30 or \$35. The better times and prospects will combine with lower prices for good machines to make the year of '99 the star year. We do not know whether other dealers here are buying more freely than usual, but intend to do so ourselves.

Illinois.

H. GEO. PROUTY & Co.

#### Reduced Prices Will Increase Sales.

The sales this season will be greater than in '98 on account of lower prices. The dealers are not buying more freely than in previous years.

Illinois.

PHIL WADE.

#### Expects Trade to Remain Constant.

I think trade will be about the same as last year; possibly a trifle better, on account of the reduction in prices. Dealers here are buying a little more than last year; that is, they are carrying a larger stock of bicycles.

Illinois.

F. H. PURDY.

#### Bad Roads a Calamity.

I think the sales will be less on account of our poor country roads. We have depended almost entirely on city trade up to the present, but now the fad is over and bicycles will be bought for business only. I don't think this will increase the agent's

enthusiasm much, but will, on the contrary, lower it.

Illinois.

JAS. M. NEWTON.

#### Young Men Are Buying Horses.

I am not able to say as to whether sales will be greater this year. A great many of our young men have purchased horses and buggies, and they will not be likely to want bicycles until the novelty is worn off of their rigs. I am the only bicycle dealer here and I am not buying very heavily.

Illinois.

J. A. BEELEY.

#### Buyers May Look for Cheap Machines.

The sale of bicycles is apt to be about the same as last season. The lowered list price is likely to make buyers look for something still cheaper. We think that dealers are not buying as freely this season as in previous seasons.

Illinois.

BRODE HARDWARE CO.

#### Buyers Will Complete Their Purchases.

I think the sale of bicycles will be greater this season than last year. I have sold more so far than in '98 up to the same date. I think the lowered list prices will help sales and that there will be fewer machines to be taken back. I have placed sample orders for more bicycles than in '98.

Michigan.

STEELE & COLLINS.

#### Dealers Expect Prompt Deliveries.

I think the sale of wheels will be greater this season because money will be easier and Uncle Sam says peace and prosperity are in sight. The effect of lowered list prices will be good, for I believe they will induce the public to buy higher grade bicycles, and thus make more satisfied riders. Dealers are not buying noticeably any more freely than usual, because they think they can get the bicycles delivered as needed.

Michigan.

H. E. BELDING.

#### Two Reasons for Better Sales.

From what I can learn I believe the sale of bicycles in this vicinity will be greater this year than in '98. My reasons for this belief are that the lower prices and the improvement in general business will both tend to increase the demand. I don't think the dealers here are generally buying more freely this season than last, for past experience, I think, has taught them to buy cautiously.

Michigan.

F. W. MORTON.

#### Has Come to a Standstill.

The sale of bicycles will not be any larger this season than in '98 and the lowered list prices will have no beneficial effect. The dealers are not buying more freely than usual.

T. E. BIBHEL.

#### Anticipating Larger Sales.

The sale of bicycles will be greater this season than in '98. The effect of lowered list prices will be to increase the sales. Dealers are buying more heavily than usual.

Michigan.

BATTLE CREEK CYCLE CO.

#### Dealers Buying More Freely.

The sale of bicycles will be greater this season than in '98. The lowered list prices will increase the sales. Dealers are buying more freely than usual.

Michigan.

SMITH & GLASS.

#### Expects Fewer Sales.

We think there will not be quite as many bicycles sold this season as in '98. The lowered list prices will help sales. Dealers are not buying as freely as usual.

Michigan.

ALDRICH BROS.

#### A Dealer's Complaint.

To the Editor—I have been reading with a good deal of interest what the dealers throughout the country have to say about express rates. We dealers in the south probably have as much cause as anyone to feel the force of high express rates, as we are further from most of the distributing points for cycle goods. We hope the movement will have its proper effect and that we will shortly have lower charges. We use freight

wherever possible and are having very good results.

There is another point, however, that I think is equally as important as a reduction in the express rates and that is the employing of thoroughly competent men in the shipping departments of factories. To illustrate: A few weeks ago we gave a well known tire manufacturer an order for one pair of light tires and three dozen inner tubes. In a short time we received a pair of tires weighing about four pounds and about eight pounds of the manufacturer's advertising matter. The expressage was \$1.50. Two weeks later we got the tubes; expressage \$2.05; making \$3.55 in all. The value of the goods so bought was less than \$25, and the charges on carriage were \$3.55 or about 15 per cent. Rather heavy, isn't it?

Why didn't that factory pay the charges on their advertising matter? And why didn't their shipping department ship all the goods at one time?

We are in favor of lower express rates and also of more careful attention to shipping on the part of factories.

Nashville, Tenn. DUNCAN R. MORRIS.

#### "LET THERE BE LIGHT"

##### Need of Lamps Grows Greater Yearly—Objections Overcome By Improvements.

The number of bicycle riders has increased so greatly in the past few years in all parts of the United States that pedestrians and teams are likely to be met most unexpectedly at all hours of the night, even on remote country roads and in small villages. For this reason every cyclist who goes out after dark without a light menaces the lives and limbs of men, women and children, whether in city, small town or on country road, annoys drivers of horses and runs innumerable risks himself.

European countries have national laws compelling the carrying of lighted lamps at night which apply to every hamlet and country highway as well as to large cities, but in this country it is a matter of local option. Many of our leading cities have adopted ordinances compelling the use of lamps, and, though these met with great opposition from wheelmen at first, principally owing to the common deficiencies of bicycle lamps of some years ago, which have now been overcome, those cyclists who have become accustomed to carrying lamps and know their value now carry them from choice.

Opposition to such regulation is a mistake, and all large communities where cycling is common should have ordinances requiring the use of lights. Undoubtedly this should apply to other vehicles as well as to bicycles, and it has been made to do so in a number of enlightened cities, but because the bicycle is such a silent machine and so swift it becomes especially necessary to warn others of its approach. The old objections to lamps and arguments against carrying them, particularly on country roads, no longer hold good in these days of highly improved oil, gas and electric lamps, which will be found of much assistance in avoiding obstructions and bad places in the road even by the impatient road scorcher.

#### Chainless 30-inch Wheel Machines.

In the state of Connecticut chainless machines with 30-inch wheels are being offered for \$40. In the state of Ohio a chainless machine with 28-inch wheels is being offered at \$40, the regular price of which is advertised at \$60. It is scarcely necessary to add that the form of gear used in both instances is not of the types which have found most favor with the trade.

# CYCLE AGE ADVERTISES

Vol. XXII. No. 18.

THE CYCLE AGE OFFICE.

March 2, 1899.

## CYCLE AGE REPAIR BOOK.

Orders Pour in Rapidly—A Summary of the Contents.

Last week's announcement of the early issue of "Modern Cycle Repairs" has borne abundant fruit. Orders have poured in rapidly, showing that the trade appreciates the value of a work of the kind under Cycle Age auspices.

"Modern Cycle Repairs" will be ready in a few days. It will contain over 100 illustrations. Its contents are here briefly summarized:

### CHAPTER 1—Repairs, or Replacement.

First equipment of the shop. A study of economical methods. Illustrations of good and bad methods. List and cost of tools and fittings. Use of assembling jacks.

### CHAPTER 2—Wheels and Component Parts.

Purchase of spokes, sizes to buy and how to keep them. Rims; tools for spacing and drilling. Inexpensive truing jigs. To repair broken spoke holes in hubs. Nipple grips. Replacing cups and cones. To braze a split cone.

### CHAPTER 3—Frame and Forks, Brazers and Brazing.

To braze without spoiling enamel. Three ways to repair broken tube. Broken lugs, fork ends and fork stems. Dangers of twisted forks. Truing a frame. Selection of a brazer.

### CHAPTER 4—Remodeling of Frames.

Computing the cost. Cutting down frames. Changes of all sorts in singles and tandems.

### CHAPTER 5—The Crank Hanger.

Remodeling. Loose cranks. Buckled tandem sprockets. Two-piece construction.

### CHAPTER 6—The Steering Head.

Broken crown cones. A question of solder. Fixing loose cones. Squeaking steering heads. Rust on nickel.

### CHAPTER 7—Seat Posts and Handle Bars.

Broken parts. Internal expanders. The flashing of tubing. Ways of bending bars.

### CHAPTER 8—Hints on the Art of Enameling.

Necessary equipment. Keeping of enamels. Coating and baking. Two and three color work.

### CHAPTER 9—Saddles and Pedals.

Springs and clamps. Repairing pneumatic saddles. Rattan lacing. To make pom-

mel clip. Broken springs. Difficulties of pedal repairs and how to overcome them.

### CHAPTER 10—Building Frames from Component Parts.

Should be undertaken by men of experience only. A variety of patterns. Correct angles. Dimensions. Cheap mandrels and their uses.

### CHAPTER 11—Purchasing Parts for Special Work.

Ingenuity of great value; examples. Methods by which many parts may be made of unexpected value.

### CHAPTER 12—Experimenting With Construction.

Repairmen best suited to devise practical improvements. Value of their ideas.

### CHAPTER 13—Mechanical Power in the Shop.

Practical advantages. Cheapest forms of motors. Installation. Floor plan.

### CHAPTER 14—Miscellaneous Repairs and Suggestions.

### CHAPTER 15 Tire Repairs.

According to tire construction. Method for each kind described.

Price to Cycle Age Subscribers, One Dollar; to all others, Two Dollars. Order at once. First come, first served.

## Advertisers and Advertising.

A furious shower does not soak in so well as a steady rain.

Does it?

A double-column advertisement once a year is not so good as a half-inch fifty-two times a year.

Is it?

The parallel is fitting.

The time is ripe to make a contract for a steady rain of advertising. Let the water begin to fall, it will begin to soak in at once; and as the weeks lengthen into months, you have watered your entire territory.

Don't get funny at this argument, and say that after a while things would get too muddy.

We are not talking about deluges.

That's what these once a year fellows enjoy.

The highest praise Artemas Ward had for George Washington was that he "never slopped over."

Did you ever study mathematics, and learn that 1 and 1 make 2, and 2 and 2 make 4, and 4 and 4 make 8, and 8 and 8 make 16, and so on?

Some of you never get above 1 and 1 make 2.

You don't figure the cumulative powers of advertising.

You believe one good "old soaker" is worth twenty "drizzles."

You don't realize that three-fourths of the water in an "old soaker" runs off, and finds its way into the gutters.

Figure how much you are going to appropriate for advertising. Divide it by fifty-two, and take so much worth for each week.

The water might freeze now as it falls, but it will be there when the thaw comes in the spring.

## Your Uncle Sam

## BUILT-IN GEAR CASES

### Chain Runs Replace Right Forkside — Similarity of Lindsay and French Constructions

Two patents were this week issued which are interesting to those who believe in the future of the gear case and especially to those who prefer the gear case which is built in as a part of the

ordinary manner but the right bearing cup is held by the outside face cover to the sprocket box. This cover is slightly dished around the axle so that the crank hub may lie close to it and not cause by

bicycle frame. One patent is that granted to T. J. Lindsay of Lafayette, Ind., and comprises the chain and gear case construction applied to the Lindsay bicycle with which the public is more or less familiar. The uppermost illustration shows this device. While it is principally intended for use in connection with the Lindsay gear the inventor states that the same construction is applicable to bicycles in which the front sprocket is attached to and driven directly from the crank shaft in the ordinary manner. The claims embody a construction in which the hanger bracket has an enlarged box on the right end containing the forward gearing and two chain runs securely attached to the box and forming part of the bicycle frame by displacing the usual single right rear fork. The right rear stay is fastened to the rear sprocket box, the back portion of which is separate from and telescopes into the forward section.

#### Enlarged Hanger End Covers Sprocket

In the second illustration is shown the design for built-in gear cases invented by two Frenchmen, the patentees being C. A. Chevalier and N. G. Vasseur of Caen, France. The bracket is formed with a dished box on the sprocket side from which project chain runs forming, as in the Lindsay machine, a double rear fork for the right side of the bicycle frame. The rear end box is very similar to that of Lindsay's though the detached telescoping portion represents a smaller part of the whole box and the chain adjusting screw operates from the rear instead of from the front.

#### Bearings Attached to Removable Cover.

The left crank shaft bearings are placed in the end of the bracket in the

its offset an excessive distance between the crank end and the case. With some forms of American cranks in which there is no offset hub at the axle end this pro-

vision would not be necessary, but in this invention the design is made to accommodate a three-piece crank and axle construction with keyed-on cranks. A short sleeve is formed by the inturned edges of the dished cover and it is in the hole thus formed that the bearing cup is placed,

the sleeve and cup being correspondingly threaded so that the latter may be screwed into position. This construction brings the right bearing entirely within the outer face of the sprocket housing and almost directly under the chain line of the sprocket which is dished quite deeply and secured to the axle near the center of the latter. The bearings are to be lubricated through an oil way drilled longitudinally through the axle and from which short ducts lead to the cups.

While it can be claimed for this construction that the right side row of balls is farther out toward the end of the crank shaft than they could possibly be were they run in a cup fastened to the bracket inside of an ordinary straight or slightly dished sprocket, it is a disadvantage that the gear case cover cannot be removed without first taking off the right crank and then the axle cone and finally pulling the cup and balls out with the cover.

#### London Motor Vehicle Show.

The international motor vehicle show to be held in Richmond near London by the Automobile Club of England, from June 17 to 24, promises to be a great affair. The automobile clubs of France, Belgium and Switzerland have promised to hold races. Already 54 English, 25 French and one American firm have applied for space. Subscriptions for prizes for the different competitions amount to \$1,080. There will be eight sections in the show, as follows: 1—motor vehicles; 2—motors; 3—tires and wheels; 4—vehicle frames and bodies; 5—parts and accessories; 6—machinery and tools for making motors and vehicles; 7—costumes; 8—newspapers, publications, and photographs.

#### Edison's Opinion of Motor Bicycles.

Buffalo, Feb. 28.—Thomas A. Edison was a visitor to this city last week. In the course of a chat with a Cycle Age representative concerning automobiles, to which "the wizard" is devoting much time at present, he was asked why he didn't turn his attention to the bicycle.

"Oh, that's a mere toy compared with the horseless carriage or truck," was his reply. "It's too small and light, and would not lend itself to electricity or other mechanical methods of propulsion. You might have an electric tricycle and with speed, too, but no bicycle."

## The Watson Automatic Seat Post

The only PATENTED Automatic Seat Post in the world. Convertible to front or rear L. Locks and unlocks automatically and instantly. Made on the wedge principle, therefore binds equally its whole length, and can't bulge the tubing. Fits any wheel made. Our customers will confer a favor by informing us of any bona fide sale and delivery of a seat post similar to ours, as we shall positively prosecute any infringement on this post. In the United States we have two patents issued July 12th, 1898, February 28th, 1899, the third allowed and the fourth pending. Outside of the United States our post is patented in every country where bicycles are made. We have doubled the capacity of our factory and from this time on will be able to fill all orders promptly. We manufacture a Handle Bar on the same principle as the Seat Post, but are sold ahead until April 1st. Orders will be received for delivery after that date. Send for circulars and price lists of Seat Post and Handle Bar.

## MOTOR VEHICLE PATENTS

### Means for Reducing Shocks on Gear in Electric Vehicles —Barr's Construction of Freight Truck

Clinton E. Woods, of Chicago, assignor to Fischer Equipment Company, No. 619,527, February 14, 1899. Motor vehicle.

The patent has reference to the manner of mounting the bodies and motors of electric vehicles on springs and is of interest also to constructors of vehicles propelled by gas or steam. In electric vehicles it has been common to either attach the motor rigidly to the running gear or to give it an entirely independent spring support. In regard to the objections to rigid attachment the patentee says:

"It is important to give the motor a spring mounting to prevent sudden impact or violent engagement between the cogs of the gearing, as when the vehicle is suddenly started ahead, stopped, or reversed, or when the vehicle-wheels strike ruts. But such a wide range of motion as permitted to bodies of light vehicles would be objectionable if possessed by the motor. By attaching the motors to the ends of the elliptic springs, as shown, the vehicle body and motors may have the ranges of movement to which they are peculiarly suited."

Of the illustrations the first one indicates the application to light vehicles, the second one to heavy vans. In either case the patentee employs two motors, one for each of the driving wheels, and dispenses with differential gearing. In the light construction the elliptic spring supports the wagon body over its middle portion and one end of the motor at the end of the spring which has a smaller range of movement than the middle part. The other end of the motor is pivotally mounted on the driving wheel axle.

#### Yielding Motor on Freight Wagons.

With vehicles of heavy construction the range of motion of the vehicle-body is decreased and approaches more near-

ly the desired range of motion of the motor. In adapting the invention to heavy vehicles, the rear portion of the vehicle is supported upon three semi-elliptic springs. The forward ends of the two side springs are attached to the

wagon-body and the free ends of the motors are also attached at the same point by adjustable straps of leather. Supplementary semi-elliptic springs are anchored to the wagon-body at their ends and yieldingly limit the tendency of the motors. By this construction a direct downward pull is exerted by the motors upon the wagon-body through the medium of the straps when the motor is started to

back the vehicle, this downward movement being resisted by the supplementary springs. When the motor is started to move the vehicle forward, the springs yielding limit the tendency of the motor to move upward. When the vehicle is suddenly stopped or when it strikes a rut, the elliptic springs will give to ease the motor. The motors are preferably firmly braced together, to maintain the motors in alignment.

#### To Make Motor Tricycles Fool Proof.

Albert De Dion and Georges Bouton of Puteaux, France. No. 617,984. January 17, 1899.

The invention relates to a mode of securing the motor axle to the frame of a motor carriage—especially a motor tricycle—and allowing the taking to pieces of the part of the axle on the right, together with its wheels, or that on the left without taking the motor to pieces, and especially without interfering with the adjustment of the ball-bearings, which form a part of or are carried by the axle.

The means employed are described in the one claim allowed as follows: In motor-vehicles, means for securing each of the halves of the motor-axle to the frame of the vehicle, the said means consisting of cones on each of the halves near their extremities, a tube surrounding the axle and having sockets, clips supporting said tube, balls disposed to roll upon said cones and caps screwed into said sockets holding the balls in place.

#### Elastic Speed Change Gearing.

Clarence Sterling of Bridgeport, Conn.; No. 618,915, February 7, 1899. Motor Vehicle.

The patent carries thirty claims, involving among the principal features a speed-changing mechanism, in which coiled springs surrounding collars on the driving wheel axle are connected to the

various gears at one end while the other end may be engaged by rotatable sleeves carrying drivers. By the gradual tightening of the coiled springs around the collars, breakage of gear teeth, when speed is changed, is avoided. The inventor uses a spring mechanism for supplying the first power wherewith to start the vehicle after a rest and subsequently charges the storage-spring by means of his driving power.

#### Looks Like Compressed Air Autotruck.

William C. Barr, Jersey City, New Jersey. No. 618,244, January 24, 1899. Motor Vehicle Truck.

All four wheels are operated. Steering is effected without interfering with the motor, and the front axle has a vertical movement which does not interfere with the gearing.

The illustrations show a vertical lengthwise sectional view, a transverse vertical sectional view through rear wheel axle and a plan view of the forward end of the truck.

**T**HE delight in cycling is in smooth and easy running bearings, in fact, the bearings come pretty near making the bicycle. In the finishing touches on those parts we spend thousands of dollars annually which other makers save. We gain by that extra expenditure enduring reputation, satisfied riders and growing business. **This hanger bearing is the most important of all and in it we have all the good points which make riding easy.** In our catalog we describe this bearing fully and show you why it is the best. Your customer will be won by these good points. They are not talking points—simply meritorious and substantial improvements which make the NATIONAL run easier than others.

# THE PASTIME AND SPORT

## STEVENS THE 24-HOUR HERO

**Wins Coast Race Without Dismounting  
Once—Turville a Close Second—  
McFarland Defeats Elkes.**

Score at end of twenty-four hours:

M.	L.	M.	L.
Stevens	459 6	Chapman	440 1
Turville	459 6	Fredericks	435 4
Lawson	455 6	Julius	422 7
Pierce	455 3	Ashinger	412 4
Waller	451 4	Nawn	401 1

San Francisco, Feb. 27.—The twenty-four-hour race which ended at 10:23 Sunday night in Mechanics' Pavilion, was won by E. D. Stevens of Buffalo by several yards from Charles Turville, retrieving the fair name lost when he quit the six-day race without apparent excuse. During the entire twenty-four hours he did not dismount. He had only Turville to beat in the last mile and he shook him at the bell by starting a sprint down the last bank and gaining a lead which he held to the tape.

This was the first twenty-four-hour race ever held on the Pacific coast. There were eighteen starters, among whom were all the riders who rode in the 144-hour race a week ago, with the exception of Gimm. Besides these, Charles Kraft, the champion road rider of the coast, and William Furman, of Los Angeles, started also.

### Sprinting Becomes Lively.

Miller, Aronson, Hale, Barnaby and Pilkington dropped out early in the contest, probably not sufficiently recovered from the exhaustion of their supreme efforts in the six-day race, and the others, encouraged thereby, had many lively sprints in the endeavor to gain laps on the bunch. Waller's eyes still troubled him and he wore glasses, but followed the pace well until his chances were spoiled by a general spill caused by the breaking of Pierce's pedal, which brought down all but Julius.

Next to the riding of Stevens and Turville, the work of John Lawson attracted especial attention, as he rode from start to finish without dismounting except when brought down in the mix-up.

At the finish the fight for first prize was between the two leaders, the other eight competitors withdrawing. The record of 464 miles was not approached but the score in the New York race was beaten by 9 miles 7 laps.

A careful measurement of the track in Mechanics' Pavilion, proves that the riders keeping 18 inches from the inside edge would travel 56 inches over a mile every eight laps, instead of the exact mile with which they were credited.

### Western Circuit Opens in San Jose.

The racing men will leave this week for San Jose, where a two-days' race meet will open the circuit which the American Cycle Racing Association intends to conduct on the coast. On March 11 and 12 a two days' meet will be given at Fresno, and after that the riders will go to Santa Monica, where another two days' meet will be given. From Santa Monica the party will return to San Francisco for a meet to be given by the Olympic Wheelmen at the Olympic grounds. The managers are also figuring upon a meet in Sacramento. From there the circuit will extend east to Ogden, Salt Lake and Denver. It will end at Chicago, where it is planned to hold the last six-day race of the season.

Last Wednesday Floyd McFarland defeated Harry Elkes in a fifteen-mile

paced pursuit race. The riders started from opposite sides of the track and were paced by twenty men. Elkes quit at the end of eight and a third miles, McFarland then being almost ten laps in the lead. The time of the winner, which lowers all indoor records from three miles up, was as follows, by miles:

Miles.	Time.	Miles.	Time.
1.....	2:01	9.....	17:52
2.....	4:04	10.....	19:59
3.....	5:45	11.....	22:03
4.....	7:44	12.....	24:14
5.....	9:44	13.....	26:14
6.....	11:45	14.....	28:14
7.....	13:46	15.....	30:22
8.....	15:41		

## RUMORS OF RACING TEAMS

**Makers of Chainless Gears to Demonstrate Them  
on the Track—Will Revive Interest.**

Persistent rumors are in circulation regarding the formation of "all-star" racing teams by two or more leading manufacturers of different styles of chainless bicycles. These teams, it is reported, will include sprint racers and middle and long distance riders. While the make-up has not been definitely decided as yet, it is said that Cooper, Bald, Gardiner and Kiser will form one of these teams, with two long-distance riders and pacemakers. McDuffee will be the star of another aggregation, which may include also Elkes, Michael, McFarland and Orlando Stevens. These men will enter open and match races throughout the country for the purpose of demonstrating the superiority of each type of gear over the others and all over the chain-driven machine. One of the makers in question has not supported a racing team for several years, and it is felt that his action will influence a few others to take similar action. Another firm has made offers to several crack racing men to join a team of which Major Taylor will be the star.

These reports are most plausible and the movement mentioned is so natural that it was predicted at the end of last season. While no names of manufacturers are mentioned it is easy to guess at the identity of the concerns affected from the racing men involved, the sources of information and the half-guarded descriptions of the companies. That there is going to be commercial competition between the makers of the several styles of chainless gears is perfectly obvious, and it is most probable that this rivalry will take the usual form of practical speed demonstration on the track, ocular proof of the practicability, durability and especially the speed of a machine being most convincing to the riding public. The formation of such teams would bring about a partial revival of team rivalry that will be most stimulating to the sport.

A Parisian manufacturer of bicycles has rented large grounds adjacent to the exposition grounds and will fit up buildings for the storage of 2,000 bicycles and 300 motor vehicles daily during the 1899 exposition. He has secured the promise of the patronage of the Touring Club of France.

The hour motorcycle record was broken in France on February 11 by Vigneaux, who covered 51 kilometers 608 meters (32 miles 131 yards), adding 2 miles 1,032 yards to the best previous record.

The U. V. F. has fixed the license or registration fee for French professional riders at \$4.

## AUSTRALIAN NATIVES' RACES

**Melbourne Favorite Wins the Great Prize  
—Attendance of 51,000—Night  
Racing at Sydney.**

Sydney, Jan. 28.—The great Australian Natives' Association race meet, which is extended over three days this year, was opened in Melbourne January 26. In the afternoon when the racing began there were 25,000 persons present, and in the evening when the meeting was continued by electric light there was an estimated attendance of 26,000, making a total of 51,000 who paid for admission during the day.

The racing was of a brilliant nature. The principal events were the A. N. A. wheel race with prizes aggregating \$3,750 and the A. N. A. Gold Stakes, \$700, limited to twenty riders. The big handicap race was run off in eighteen heats, three semi-final and a final. It was won from the 220-yard mark by W. Matthews, who has been favorite for nearly every big race run in Melbourne during the last three years. He rode an American machine. The field bunched early. Matthews shot out half a lap from home and after a slashing finish with Herman won by a wheel, with Esler a close third and Hopkins fourth.

### Walne Takes the Gold Stakes.

The Gold Stakes scratch race was won by Walne by inches. After the conclusion of the race Walne was hauled up before the officials, who considered that his riding had been inconsistent during the day. They held an inquiry which was adjourned. The meet will be continued today and next Saturday. The summaries:

Two-mile A. N. A. wheel race, \$1,250 first prize, \$750 second, \$225 third: Final heat—W. Matthews, 220 yards, first; L. Herman, 230 yards, second; J. Esler, 200 yards, third. Time, 4:21.

Three-mile A. N. A. Gold Stakes, \$350 first, \$175 second, \$75 third: Final heat—R. Walne, first; W. C. Jackson, second; A. C. Forbes, third.

One-mile Federation handicap, \$200 first, \$100 second, \$35 third: Final heat—S. E. Gordon, first; G. Carpenter, second; R. W. Lewis, third. Time, 2:03 3-5.

### New South Wales Electric Light Meet.

A race meeting by electric light was held on the Sydney cricket ground track January 17 and 19. The first night the races went off smoothly but the second night's racing was a chapter of accidents. Several riders were severely injured and one rider, James Somerville, fell and fractured his skull, succumbing to his injuries three days afterwards. About 12,000 people attended each night with the expectation of seeing Joe Megson defeat Walne, but the latter scratched for the scratch race each night. Megson won the 5-mile scratch race on the first night from Forbes and would have won again on the second night only for falling.

### The L. V. W. Cup Meet.

The League of Victorian Wheelmen held a meeting January 14 and 21 on the Melbourne cricket ground. The attendance was about 7,000 the first day and about the same number the second. On the first day of the meet there was an unusually large number of spills caused by the unbanked grass track.

Walne won the mile scratch race in 2:23, and Jackson annexed the ten-mile scratch in 25:02 4-5, with A. B. Crisp second and A. C. Forbes third. There was a one-mile race on ordinaries which

# WHAT DO THEY PROVE

EVERYTHING FOR BICYCLE BUILDERS AND DEALERS.

## EXCELSIOR SUPPLY CO., CHICAGO

ESTABLISHED 1876.

88 AND 90 LAKE ST.

was won by Herman from 100 yards behind scratch.

The principal event, the two-mile scratch race for the L. V. W. cup, for which first prize was \$250, went to S. E. Gordon. Fitzgerald finished first but was disqualified for fouling.

#### Sydney to Melbourne Record.

T. Riley, forty-five years of age, established an unpaced record between Sydney and Melbourne that will likely stand for some time. The road was very bad on the Victorian side and the thermometer registered above 100 in the shade during the last three days of the trip. The exact time for the 576 miles was 96¼ hours. He rode an American machine.

#### Selecting the Racing Board.

New York press correspondents report that Fred Gerlach, ex-member of the L. A. W. racing board for Illinois, will be the next chairman of the national racing board, to be appointed in a few days by President Keenan. The guessers even go so far as to state that if Gerlach is appointed he will move from Chicago to Philadelphia, where he will be in closer touch with league affairs. Other probable members of the board are expected to be A. W. Robinson of Boston, George L. McCarthy of New York, Harvey Uhler of Philadelphia and C. W. Mears of Cleveland. The profitless curiosity of these cycling scribes is exceeded only by their audacity in seeking to arrange the membership of the board for the league president without so much as consulting his opinion.

#### Banker Shut Out in Rome.

The European winter circuit was brought to a close February 12 by the meet for the great prize of Rome. On February 9 Grogna won the consolation heat and qualified for the final. Tommaselli ran second to Conelli in the first semi-final, Banker second to Ferrari in the second, and Singrossi won the third with Minozzi second. The consolation for the seconds in the semi-finals was won by Tommaselli, with Minozzi second and Banker third. This left four of the best Italian riders for the 2,000-meter final, which was won by Singrossi by a foot from Tommaselli. Conelli was third, by inches only, and Ferrari a close fourth.

Grogna won the consolation race by five lengths from Dei, with Aghemio third.

The 3,000-meter tandem race was won by Banker and Tommaselli, with Dei and Singrossi second and Prisini and Bixio third.

#### Managing Committee for Racing Men.

The Riders' Syndicate of France, corresponding with the American Racing Cyclists' Union, had a stormy meeting February 10 upon the demand of several of its members, including Bourillon, Lamberjack, Jaap Eden, Nieuport and Domain. It was announced by the president that an understanding had been arrived at with the Belgian, Dutch, and Swiss riders' syndicates, which will work in unison with the French union. A protest was raised against the decision of the U. V. F. to charge the members \$1 for license to race as professionals. The president then announced a project for the appointment of a committee to have charge of all the engagements of the members of the syndicate, making the committee virtually the official representative of each member individually in his relations with the tracks. The proposal was favored, provided the committee be made to act absolutely independent and that no outsider be allowed to enter the combination. A tumult was raised

when some one demanded a statement of the financial standing of the body and another proposed a commission to examine into the finances. The motion was lost and another meeting announced at which a report of the finances would be read.

#### Fear Still Felt for Gimm.

Louis Gimm is still in a critical condition and unable to regain strength. He has apparently been recovering from the effects of his six-day ride and it was reported that a fortnight's rest would put him on his feet, but it has been discovered that an abscess is forming in his hip and unless it can be dispersed will have to be operated on. In his weakened condition he might not be able to successfully stand this. He was taken a few days ago from his hotel to St. Luke's hospital in San Francisco. Sunday his trainer, Leonert, telegraphed his condition at length to Gimm's parents in the East.

#### Skate Sailing Norwegian Fashion.

The home of skate sailing is Norway. In order to sail in the Norwegian fashion two skates 3 feet long and a sail rigged to a long bamboo pole are required. Long skates are necessary, because the

enormous lateral pressure of the wind on the sail would otherwise overturn the skater. The sails are made in all conceivable shapes; almost every sportsman has his own particular form, of the efficiency of which he is firmly convinced. Perhaps the most useful type is the one illustrated.

The sail-frame is firmly held by the right hand and is directed by a steering cord held in the left hand. A downward pressure of the right hand forces a steel spur at the end of the bamboo pole into the ice, whereby the skater is enabled either to reduce his speed or to stop himself entirely. The sail is simple in construction, but requires no little dexterity in handling.

#### NEWS IN BRIEF.

Dave Shafer says "it was a sorry day when promoters became managers of racing teams."

J. W. Stocks, the veteran English rider, is coming to America this summer on business and to try a new motorcycle on our tracks.

Plans are being drawn up for the construction of a new quarter-mile board bicycle track at 67th street and Stony Island avenue, Chicago.

Worth Cummins of Springfield, O., and E. Moross of Detroit have completed arrange-

ments for a cycling trip around the world, following the route of the McIlraiths.

The tax on bicycles in Niagara County, N. Y., yielded \$2,331 the past year. This sum was expended in building sidepaths.

T. J. Keenan, Jr., president of the League of American Wheelmen, has been appointed on the staff of Governor Stone of Pennsylvania, with the title of lieutenant-colonel.

Ottumwa expects to get the state meet of Iowa this year and enthusiasts there are figuring on building a new track and stand for \$2,500, of which \$1,500 has already been raised.

Harkins Downing of San Jose announces that he is coming east to follow the National circuit this season. He will be under management of Charles Ward with Harry Gibson.

Some of the members of the N. C. T. A. have at last received their back salary. McDuffee, Coulter, Henshaw, Kent and Hines are among the list of those whose accounts have been squared.

Major Taylor says that before the season is over he will go for all records up to the hour. His attempts will probably be made at Willow Grove, Philadelphia. He expects to do 1:23 for the mile.

Joe Downey has secured a motor cycle, and will probably make his debut behind the machine February 28 at New Bedford on the 19-lap indoor track, when he will try to lower Harry Elkes' paced record.

Tom Eck says he is considering an offer from the South London Athletic Association to act as athletic trainer in the English metropolis the coming season, and if he accepts will sail for the other side next month.

Jimmy Michael has signed a contract to ride for Phil Dwyer as a jockey and left San Francisco for the east last Thursday, announcing that he had ridden his last mile as a professional cyclist. While on the coast he practiced horse riding daily, coached by Tod Sloan.

It has just become generally known in racing circles that Oscar Hedstrom, C. S. Henshaw's tandem mate for several seasons, eloped with Miss Julia Anderson of Middletown, Conn., recently. Hedstrom celebrated his wedding by winning the half-mile indoor championship, and then returned to Middletown, where he is now building bicycles.

Friends and relatives of August C. Mertens of St. Paul, ex-five-mile champion, fear that the racing man is losing his mind. Reports say that Mertens secured a razor the other day and threatened the life of his wife and his other relatives. This is only one of his many peculiar actions. Mertens had a bad fall last spring while in training at Atlanta and was badly injured about the head. This it is feared has been the cause of his actions of late. That the fall had a bad effect on him was shown by his riding last summer. From being one of the best second-raters Mertens went backward until he couldn't win in any company.

A story has just leaked out of a fistic encounter between Tim Hurst, the little St. Louis professional amusement promoter, now associated with Jim Kennedy and Pat Powers in the racing venture on the coast, and Al. Weing, Michael's six-foot trainer. During the recent six-day race Hurst appeared in the pavilion one afternoon, and in conversation with Weing made some very sarcastic remarks about the bicycle fraternity in general, closing with the intimation that professional riders were the "scum of the sporting world." Weing resented this reference to the men of his calling and promptly hit Hurst on the jaw. The ex-league umpire made an attempt to retaliate, and got a terrible wallop, necessitating retirement to his rooms for a week for repairs.

George Kruger of South Africa is being proclaimed the Michael of that country and is looked upon as a coming world beater if he continues to display the remarkable speed which has won him fame in his own country. He is only seventeen years of age and of small stature, but has extraordinary staying power. He judges pace excellently and follows multicycles at top speed with great ease. Moreover, he is good at open competition and unpaced work, knowing how to use his head. At the championship races in Johannesburg he won the ten-mile open race from a large field of starters in 24:48, the first five miles of which he covered in 12:13 2-5. The African enthusiasts are so confident he can make a showing in any field that they are raising a fund to send him around the world on a racing trip to meet all the top-notchers, and Montreal and the east will be given a chance to see his work this year.

## MINNETONKA CYCLE PATH

### The First Instance in the Country of a Path Built By County Funds—Forty-Mile Ride

Minneapolis, March 28.—There is no more enjoyable bicycle run in the northwest than over the Minnetonka cycle path. The path is 12 miles in length at present. It commences at Lake Calhoun, within three-quarters of a mile from the west city limits, and finishes at the Hotel St. Louis, Lake Minnetonka.

The Minnetonka path is the first instance in the country of path built by a county. The entire expense was borne by Hennepin county, which appropriated \$6,500 for the improvement of the Minnetonka boulevard. The action was taken at the suggestion of the Minneapolis Cycle Path Association last spring. The scheme had been spoken of to some extent, but when secretary Frank H. Wadsworth appeared before the commissioners it was uncertain just how he would be received. The commissioners, however, proved to be up-to-date men and made the appropriation.

#### Day Labor Instead of Contract Labor.

It is not surprising that mistakes were made in the construction of the path. The commissioners were perfectly honest in the matter, but made the fatal mistake of having the work done by day labor instead of contract. The three-quarters of a mile stretch within the city was done by contract labor. This

run is out into the country. There used to be a couple of bad hills, but these were leveled when the roadway was improved, so now the run is a very smooth one. It goes through fields and by beautiful farm homes, and finally ends at the Saratoga of the northwest.

#### Extension of Path is Planned.

The present path is but the start of what will finally be the most beautiful

The path at present connects with the Lake street path, Minneapolis, which runs towards St. Paul, and connects with the Summit avenue path there, and from there on to White Bear Lake. There is thus at present a continuous path of 40 miles.

The Minneapolis Cycle Path association has already commenced an active campaign in behalf of path building. The new 1899 tag has been received and is selling rapidly. To stimulate the sale two bicycles have been offered as prizes for those selling the most tags.

#### Oregon Passes Cycle Tax Bill.

The state legislature of Oregon has passed a bill providing for the levying of a tax of \$1.25 each on bicycles on or before March 1 of each year and collection within sixty days from date of levy, the

PATH AROUND THE LAKES.

ENTRANCE TO THE PATH.

was rapidly completed, and in such a way that the wheelmen figured on having a grand opening of the entire path some time in June. Through the employment of day labor, however, the work dragged out in such a way that it was not until last September that the path was ready.

#### Path is Eight Feet Wide.

The path is eight feet wide, and of excellent surface. The run is a beautiful one. The first half mile is along the shore of Lake Calhoun, after which the

50-mile trip a wheel in the country. The cycle path association will this year complete the path to Excelsior, five miles farther around the lake and possibly go further. The path will within a couple of years, at least, be built around Minnetonka, striking the present path again about a mile and a half nearer the city than the lake. From the city and around will make 50 miles, and will be along the lake front the entire way. This run can now be made, but, of course will be greatly improved with a path.

proceeds to be known as the "path fund" and devoted to the construction and maintenance of side paths for cyclists and pedestrians. Numbered tags to be attached to the machines will be issued as receipts for the collected tax. The bill further provides that every person who sells, transfers, trades or loans a bicycle must keep a list of all such machines and the names and addresses of the persons obtaining them, which shall be always open to inspection of the tax collector. It is made a misdemeanor for any person to throw glass, tacks or other substances injurious to pneumatic tires on the side paths when built, and a fine of \$10 is fixed for wantonly injuring the paths by driving stock or wagons upon them. Certain counties in the state are exempt from the operation of the law by request of delegations, which believed that the difficulty of constructing paths would be too great to warrant the collection of the tax.

Governor Geer has assured the wheelmen that he will sign the bill, and work will begin in a short time on the path from Portland to Oregon City, and from there will be built south to Salem and on up the valley.

Brooklyn riders are complaining that their cycle paths are being used for horse traffic both by drivers of the speeding fraternity and by teamsters with heavy wagons. Inadequate police service along the path is responsible for the abuse.

# INFORMATION FOR BUYERS

## "ARC LIGHT" GAS LAMP.

A somewhat novel form of acetylene gas cycle lamp is that manufactured by the Miller Mfg. Co. of Torrington, Conn., and called the "Arc Light." The combustion chamber is separate from the carbide receptacle and the water tank, being supported on a bracket projecting forwardly from the carbide cup. The screw cap covering the opening into the water reservoir is at

the extreme top of the lamp, and the water regulating valve is located in the reduced central portion of the main body. This valve has an indicator, which is graduated into twenty-four spaces marked by six numbers, making it very simple for the user of the lamp to set the lamp each time it is relighted at the point where the best results were previously obtained. The carbide is contained in a removable holder and may be used in any commercial form. The holder is divided into four spaces, each of which represents the amount of carbide consumed in one hour's burning. The lamp is easy to take apart and assemble, all of the connections being made by ordinary screw threads, and should an owner of one of the lamps break, injure or lose any part, he may obtain a duplicate direct from the maker by inclosing the price given in the illustrated price list of parts published in the catalogue. The descriptive matter in this catalogue also contains full directions for the care of the lamp under ordinary conditions and when unusual accidents occur.

## CHILDS & CO.'S ATTRACTIVE NAMEPLATES.

S. D. Childs & Co., 142 Monroe street, Chicago, are making highly decorative nameplates by a process which enables them to sell at prices much lower than is commonly asked for distinctive and artistic metal nameplates. The company puts out plates both with raised and with sunken letters and has on hand special stock shapes in great variety which can be filled out with initials and lettering to suit the purchaser. The plates can be obtained in nickel, gold,

silver, oxidized silver, or in combination gold and silver finish, and the stock patterns offered are of such variety that nearly every taste can be pleased. The company is also doing a large business in nameplates of special design, and is always pleased to submit sample designs of special plates to manufacturers sending particulars concerning the style of plate wanted. The illustrations above show two of the company's recent productions in nameplate design.

The company has been making some decided improvements in its plant. At

the present time they have a capacity of about 12,000 plates per day and have been running to their fullest extent, part of the time twenty-three hours a day. They have secured orders from and have been making rapid delivery of nameplates to practically every leading concern in America. Among the additions to their equipment has been a new hydraulic press, weighing sixteen tons, capable of pressing anything requiring a pressure equal to 1,300 tons and requiring 30 horse-power to drive it. They are using this press especially for die sinking work and are making bayonet shaped rear and front forks on contract. The most popular nameplate is reported to be the oxidized silver, but special attention is called to their new purple, blue and black finishes. These are not oxidized or acid finishes, but are actually plated. Their black finish is something entirely new and will undoubtedly be very popular next year.

Childs & Co. have also been cultivating a very extensive foreign business, and during the past week received not less than three orders from Sweden, one of which was for 6,000 plates.

They make a specialty of stamped nameplates, although they can furnish any kind, especially cast plates, but they do not recommend the latter, owing to their bulkiness, weight in shipping and general rough and unfinished appearance. Among the plates worthy of especial mention is the one they got up this year for the Viking bicycles. It is 5½ inches long, encircles the tubing, and is an exquisite piece of work. They are

also making something like forty stock styles of plates, suitable for small dealers, jobbers and agents.

## BRECKENRIDGE FACTORY BUSY.

The E. P. Breckenridge Co. of Toledo, manufacturer of the Breckenridge acetylene gas lamp and the Light Weight oil lamp, states that its business has been so great that the factory facilities have been increased so that from 500 to 500 lamps can be turned out daily. The company is doing considerable business in foreign countries and its new gas lamp seems to have "caught on" extremely well in this country, considering the short time it has been on the market.

## SUNOL AND HERCULES BICYCLES.

The catalogue of the McIntosh-Huntington Co. of Cleveland is plainly gotten up but is very complete, containing full descriptions of the line of bicycles handled by the company and also a complete list of sundries and cycle repair shop tools. It is a catalogue from which a dealer in a small town can order anything from a twist drill to a complete bicycle.

Sunol bicycles are listed in three regular models, a man's and a woman's road machine selling at \$50 each and a 30-inch wheeled pattern at \$60. The regular colors are tan and black. The standard tire equipment is the McIntosh, though Hartford or Morgan & Wright tires will be allowed as options. There are also listed a man's and a woman's Hercules at \$35 each, a 30-inch wheel pattern Hercules at \$40 and the Euclid at \$25.

One of the features of the company's catalogue is the illustration and description of the Hydrocycle—a light boat of the catamaran pattern driven by a propeller operated by a tandem bicycle placed in the middle of the boat. It is furnished regularly with the tandem driving equipment though it will be built to order for a single rider

or for any number of persons. A speed of five or six miles an hour may easily be attained to on it and no experience is required to operate it.

## SMITH & EGGE SUNDRIES.

The Smith & Egge Mfg. Co. of Bridgeport, Conn., has added to its line of standard bi-

cycle sundries. The illustrations herewith are selections from the new articles catalogued. The wrenches shown are both manufactured with a view to furnishing strong, durable tools rather than to meet lowest competitive prices. One has a solid and the other a two-part jaw, and both have four-inch scales divided to sixteenths on the flat arms. The Club toe clip, as will be noticed from the illustration, is of the short, rigid pattern, preferred by those riders who wish a stiff, unbreakable clip which does not project back as far as the usual flexible clip. The sundries catalogue also include other forms of wrenches and toe clips, several patterns of cycle locks, and foot rests, lamp brackets and screw drivers.

## BUNDY LAMP FOR PHYSICIANS.

In the accompanying illustration is shown a lamp which the makers claim is the only perfect and safe acetylene gas lamp for physicians' use in the world. It is as safe to burn as a candle and is designed for use in examining the throat, eye or ear and for delicate surgical operations in which artificial light is needed. It is the product of the factory of the Frank E. Bundy Lamp Co. of Elmira, N. Y., and the resemblance to the Bundy gas lamp for bicycles is at once apparent. The drawing shows the lamp with the reflector and burner cap removed for placing in the case. The actual size is 6½ inches high, with reflector and chimney attached. The lamp and reflector complete are put up in a handsome leather covered case six inches long, four inches high and two inches wide which can be carried in the pocket. The generator is constructed and operated the same as that in all Bundy lamps. The burner cap is intended to pre-

vent the escape of gas after the flame has been extinguished. One charge or "carbott" will furnish gas for one hour.

## FAUBER REAR FORK DESIGN.

W. H. Fauber of Chicago, manufacturer of the Fauber hanger, has been granted a design patent on a form of rear fork tube intended for use in two or three-crown frame construction. The tube is cranked near its forward end, the bend being approximately a quarter circle. The inner face of the tube in front of the bend is flat

# To Our Patrons

It is with sincere regret that we announce to our friends and patrons that through the recent total destruction of our warehouse and stock by fire we are, owing to the lateness of the season and our inability to immediately arrange to take care of your orders, obliged to discontinue the bicycle supply business. In so doing we feel that there are many of our patrons who wish to hear from us direct concerning the disposition of future orders that would in the due course of business be sent to us for goods listed in our 1899 "G" catalogue, a copy of which was recently mailed you.

It is therefore with great pleasure that we announce that arrangements have been made whereby your future orders will be filled direct by the **Excelsior Supply Co., 88 and 90 Lake Street, Chicago**, to whom we have sold our good will.

The Excelsior Supply Company have the largest and most complete line of everything for the bicycle manufacturer and dealer in the country and have facilities that are unsurpassed for the handling of your orders, and at prices that are right. You will find them very liberal in their treatment of you and we bespeak for them your continued patronage and favors.

In closing we personally, and as a firm, wish to extend to you our most hearty thanks for all past favors and regret that we shall not in the future be in a position to enjoy your continued patronage. Very truly,

**MANUFACTURERS & MERCHANTS WAREHOUSE CO.**

Per P. P. COOLEY, *Manager.*

and the flattened side extends backward nearly to the rear end of the fork, the D section of the tube there gradually tapering into a round section so that the fork may be attached to round a thimble on the rear end lug of the frame. In using the fork the inner flat faces of the straight D section portions in front of the bend in each fork side are placed together and the two thrust into a central round branch projecting from the hanger bracket.

#### TWO WHITE NOVELTIES.

The White Bros. Cycle Co., 616 North California avenue, Chicago, is introducing the two novelties shown in the accompanying illustrations. The first is a loaded brazing cap, which renders the brazing of flush joints on a flame brazing stand absolutely secure. The cap consists of a box of thin pressed brass filled with a quantity of mixed spelter and flux sufficient to braze any joint. The cover of the cap is of light sheet steel

and has projecting from it light metal expanding springs which are intended to hold the cap securely in place inside the joint and against the end of the frame lug branch. The cap is placed in the joint while the frame is being assembled, and when the joint is heated in the brazing fire the brass box will melt, allowing the spelter and flux inside to melt and run into the joint. Cut-open samples of joints brazed with these caps show that the brass after leaving the caps flows directly down between the tubing and the lug branch.

The other novelty is a rear fork end extension, which allows the use of a 30-inch rear wheel on a frame intended for ordinary 28-inch wheels. It is attached by means of two square shanked bolts which pass through the rear axle slot in the bicycle

frame, and provides by means of the vertical arc shaped axle slot for an adjustment of drop of from one-half inch below the center to one inch above the center. The hardened steel washers which are supplied with each set of extension ends burr into the soft steel of the extensions sufficiently to prevent the wheel axle from slipping out of place after the nuts have been tightened. The parts are nicked and will fit any style of standard rear fork end.

#### ELMORE BICYCLE CATALOGUE.

The recently issued catalogue of the Elmore Mfg. Co. of Clyde, O., shows four models of Elmore bicycles. The first two patterns are a pair of men's and women's bicycles listing at \$40 each and representing the company's best effort to produce a strictly first-class bicycle at a moderate price. A feature of Elmore hubs is the axle nut construction. The nuts are cap nuts and have neat conical heads which give them a very characteristic and tasty appearance. The frames have flush joints throughout and are regularly enameled in plain black, though maroon, green, orange and blue are offered as options. Hartford and Morgan & Wright tires are supplied.

The two cheaper models list at \$30 each and while they follow in general lines the construction of the higher priced machines they differ enough in certain points and in equipment to allow them to be sold at the lower figure. The finish on these patterns is decorated. The rims are natural wood color with zebra stripe. At a slight additional charge any of the Elmore models will be fitted with the Hall-Moore roller sprocket and chain.

#### SOLAR PATENTS SUSTAINED ABROAD.

The E. L. Williams patents covering the Solar acetylene bicycle lamp manufactured and controlled by the Badger Brass Mfg. Co.

of Kenosha, Wis., have been sustained in the French courts and an infringer has been ordered to pay fifty francs damages for each infringing lamp sold and the costs of the proceeding.

#### THE IMPERIAL COMPANY AND FIXTURES.

Interest in chainless bicycles was not strongly manifested until very late in '98, so late that it would have been impossible for manufacturers who had not made previous preparations to devise a chainless mechanism and get their tools ready in time for '99 business. This was a very serious problem, and one practical solution was offered by Charles H. Metz, well known as president and general manager of the Waltham Mfg. Co. and as inventor of the Dunlop tire, the center bearing pedal and numerous improvements connected with bicycles and automobiles, including a new compensating gear for automobiles which has just been patented.

For the past two years Mr. Metz and the experts in his experimental department have been experimenting, improving and perfecting various chainless devices which have culminated in a patented chainless mechanism entirely different both in appearance and construction from any that had been previously produced.

The most apparent feature in this mechanism is that instead of running the transmitting shaft inside the right rear stay, two right rear stays are used, connected in front by the crank bracket and in the rear by a specially devised yoke forming a complete loop. The transmitting shaft runs between the stays, and the shaft and gears are entirely inside this loop. This construction gives the appearance of three tubes instead of one. It has a very distinctive appearance and is readily recognized even at a distance. The advantages claimed are greater rigidity, saving of weight and simplicity of adjustment. The transmitting shaft can be taken out of the machine without removing the gears. It also has special gear case, adjustments for front and rear gears, special rear hub, rear axle, etc., patents for all of which have either been allowed or are pending.

These patents have all been transferred to the Imperial Company, which, instead of licensing the manufacturers, will make and sell a complete fixture consisting of crank bracket, rear stays and rear connections—brazed and finished ready for enameling—cranks, crank axle and bearings, rear hub, rear axle and bearings, and gear cases, nicked, buffed and assembled. With this fixture any manufacturer can make a chainless model without additional tools and can turn out finished chainless bicycles within a few days after receiving the fixtures. The Imperial Fixture is suitable for a Sager, bevel, spin roller, or in fact almost any gear, but the Imperial Company is at present confining its attention entirely to fixtures for the roller pin gears.

The Imperial Fixture first made its appearance last October, when Major Taylor, on a bicycle fitted with Sager gears and Imperial Fixtures, lowered all the world's records from one-quarter mile to two miles, including the much coveted mile record. There is no doubt that this success had a great deal to do with the largely increased interest in the chainless bicycle.

The Imperial Company has its offices at 620 Atlantic avenue, Boston, opposite the new Boston Terminal. The work is at present being done in the factory of the Waltham Mfg. Co., and some other factories in the vicinity of Boston. The company expects, however, to have a plant of its own for the manufacture of chainless fixtures and other accessories for bicycles and automobiles in the near future.

The company has already closed contracts with about twenty-five leading manufacturers for the season's supply of fixtures for their Sager chainless models.

W. D. Gash, who has been associated with Mr. Metz for several years as manager of the Chicago branch of the Waltham Mfg. Co. and later as manager of the Boston branch of the same company, is the manager of the Imperial Company.

#### WORLD BICYCLES ABROAD.

Arnold Schwinn & Co., 240 West Lake street, Chicago, makers of the World bicycles, report that orders for its higher priced machines, the \$50 Worlds and the \$100 tandems, are greatly in excess of those for its cheaper models. The company is now filling an order from Norway for 284 bicycles of the \$50 pattern. The catalogue recently issued by Arnold Schwinn & Co. is attractive and readable and fully up to the artistic standard which has been maintained in the past by this firm.

#### FISK TIRE CATALOGUE.

While the name Fisk is comparatively new to the tire trade, the parties interested in the Fisk Rubber Co., of Chicopee Falls, Mass., which makes the Fisk tire in several

patterns both for bicycles and carriages, are by no means new to the tire making industry. Three patterns of Fisk cycle tires are shown in the recently issued catalogue of the company. They are a light roadster, a roadster and a racing tire. The Olympia tire, also made by the Fisk company, is of a cheaper grade than the others, but is strong, durable and repairable and is fully guaranteed.

#### TYPE OF ENGLISH OIL LANTERN.

The illustrations below show the general design and some of the convenient features of an oil lamp now selling in the English market and which is both very practically

designed and very handsomely made. It is manufactured by the Lucas & Sons Co. and possesses the notable advantage that all of its parts can be reached for cleaning or other purposes very readily and without re-

moving the lamp from the lamp bracket of the bicycle to which it is attached, or detaching the several members. The front part of the lamp body and lens can be reached from both the inside and out by

releasing the spring catch at one side of the frame, and the entire body of the lamp being hinged to the oil reservoir, it can be turned down, exposing the back part of the combustion chamber, the burner and the reflector.

#### HANDSOME CLEVELAND BROCHURE.

As H. A. Lozier & Co. of Cleveland are justly proud of their line of Cleveland bicycles, so may they be justly proud of their newly issued catalogue, for from its striking colored cover to its last page of Bartlett-made illustrations and catchy, sensible reading matter is it a work of art both from a designer's and an advertiser's standpoint. It is replete with high-grade illustrations, showing the many distinctive mechanical features of the Cleveland, and the various models of bicycles composing the company's line are shown in groups and singly in a manner sure to convince the reader, had he any doubts before, that the Cleveland bicycle has merit which none can gainsay.

#### AN ADVANTAGE IN BUYING.

The New Brunswick Rubber Co. has one obvious advantage—its relations with the United States Rubber Co. are very close. The United States Rubber Co. is the largest rubber manufacturing and consuming company in the world. It is estimated that it consumes fully one-half of the crude rub-

ber brought into the United States, and about one-quarter of the entire crude rubber output of the world. This means, of course, that the United States Rubber Co. can buy its crude rubber at the lowest possible rates, and the New Brunswick Co. buys its crude rubber through the United States Rubber Co., getting the same price. The saving thus effected can revert to the purchaser of its tires in lower prices or better quality.

#### COLTON COMPANY FORGING AHEAD.

The Colton Cycle Co. of Toledo, O., has secured the services of A. K. Hoff, who has for years been connected respectively with the Maumee Mfg. Co., Yost Mfg. Co. and Mackintosh-Huntington Co. He is thoroughly posted in the trade and will be invaluable to the Colton company as local sales manager in Toledo. The company is altering and decorating its salesroom with the end in view of making it one of the most attractive in the central states.

The Colton factory is at present very full of business, having contracted for practically its entire output, which will consist of three-crown and regular frame machines with either 28 or 30-inch wheels and an attractive line of juvenile machines. Good business is reported on all these lines.

#### BULLIS GEAR READY FOR THE TRADE.

The Bullis Ball Gear Company of Rochester, N. Y., has arrived at the point where it is able to supply its ball-roller gear and chainless mechanism, which has been described in these columns, to the trade. In outward appearance the machines to which this gear is fitted resemble very closely those chainless machines of the bevel-gear type—such as the Spalding—in which the driving gear is in the same plane as the wheels with the casing brazed to the frame tubing. The Bullis company sells its mechanism ready to be joined by brazing at the lower front tube, the seat mast and the upper rear forks, the mechanism including, as it is sold, the one piece hanger and gear casing with frame lugs, the transmitter shaft and lower rear stay, the rear hub (of the Thor pattern) and complete set of gears.

#### LARGE LINE OF PARTS AND SUNDRIES.

The Condon & Ferry Co., 569 Broad street, Newark, N. J., shows in its catalogue one of the most complete line of cycle sundries, fittings and general equipment and building supplies that has been catalogued for some time. The goods listed are not limited to the product of one firm in each line, the company jobbing the product of many firms making standard articles, and in several instances handling numerous makes of certain particular articles. The company also handles a full line of sporting goods, being one of the largest sporting goods houses in the east.

#### NATIONAL CEMENT & RUBBER CO. GROWING.

All necessary arrangements in the way of additional machinery, etc., for tripling the productive capacity of the National Cement & Rubber Co. of Toledo have been made, and on and after March 10 this company will be prepared to fill and ship all orders for goods on the day the orders are received. This is an indication of the remarkable energy that has in a few years built up the business of this young concern until it now occupies one of the foremost positions in the country in its especial field.

#### CHASE TIRES IMPROVED.

Believing in the efficacy of the small folder as an advertising medium, L. C. Chase & Co. are now sending to the trade two such circulars, calling attention to the past success of Chase tires and to the recent improvements in their manufacture. One of the circulars, which bears the title "Facts and Figures," is a business reminder to dealers that Chase tires, besides possessing ungainsaid merit, are sold at cash prices which are very low, considering the grade of the material and manufacture.

#### IMPROVED CYCLE REPAIRING TOOLS.

Under the caption, "Ten Good Tools," the New England Supply Co. of Keene, N. H., tells in a twenty-page illustrated folder the utility, merits and advantages of its line of appliances for up-to-date bicycle repair shops. The ten tools mentioned are the wheel assembling jig, rim drill, assembling jack, wheel repair and truing stand, frame enameling stand, tube straightener, frame straightener, rim spacer, bench wheel truing stand, crank and axle straightener, and foot power emery wheel grinding machine.

#### THOMAS CATALOGUE READY.

The Thomas Mfg. Co. of Springfield, O., is now ready with its new catalogue, which is being mailed to the trade. The catalogue contains a very complete illustrated description of the construction of the differ-

ent models of Thomas bicycles and presents a substantial appearance in keeping with the reputation which has been accorded the machines made by this company.

#### RUSS TWO-PIECE RIM.

The Russ Rim Co. of Buffalo, N. Y., is manufacturing and placing upon the market a two-piece rim of new construction. The sectional view herewith shows the form of the joint between the two parts of the rim. The corresponding annular curved de-

pressions and ridges insure a tight and secure union under all circumstances, and the direction of the grain of the wood in the two sections being across each other, the rigidity of the rim and its ability to resist twisting strains is materially increased. The rims are highly finished and if desired are furnished with broad colored stripes. Some patterns are also made in V section, to meet the demand that is now quite strong for that form of rim section.

#### STEBBINS' HANGER CONSTRUCTION.

The illustration below shows the construction of the hanger made by the Stebbins Mfg. Co. of Springfield, Mass., and on which G. P. Jones was lately granted a patent, which was assigned to the Stebbins company. The cranks and axle are of that form of two-piece design in which the division is at the center of the axle and the union formed by the wedging of the parts

inside of a surrounding sleeve. The adjacent ends of the axle sections are correspondingly beveled and on one section near its end is an annular projection which engages an annular groove in the sleeve. As the axle sections do not fit the sleeve tightly, the section bearing the lug may be tipped slightly while thrusting it into the sleeve so that there will be passage room for the lug till it reaches the engaging groove. The sleeve, secured at one end to the sprocket hub, is internally threaded at the other to match threads cut on the left axle end. Thus when the two sections are placed together in the sleeve the latter may be turned in relation to the cranks and the shaft sections drawn together, the annular lug on the right axle part preventing longitudinal movement in the sleeve.

#### A STEARNS PENETRATES TO KLONDIKE.

To Miss Lotta Burns of Seattle belongs the honor of taking into the Yukon country the first ladies' bicycle to arrive there. She exhibited the machine, which was a Stearns that she had purchased in San Francisco, at the various points along the big river of the North and very amusing were the receptions accorded her by the Indians.

#### BOSTON SELECTS ST. LOUIS VEHICLE.

The electric construction division of the Public Buildings department of Boston, Mass., after the examination of a number of

motor vehicles, has placed an order with the St. Louis Gasoline Motor Co. for a sample gasoline vehicle to be used by the inspector of that department in going about the city in the performance of his duties.

#### DESIGN PATENT FOR STEARNS.

The form of rear fork construction used in Stearns bicycles is now covered by a design patent recently granted to E. C. Stearns, of E. C. Stearns & Co. of Syracuse, N. Y. In the construction patented both fork tubes are of tapering elliptical form, with the longest diameter of the ellipse placed vertically. The left fork tube runs in a straight line from the hanger to the rear end lug, but the right tube is cranked inwardly just back of the cross brace to allow for sprocket clearance.

#### BUNDY LAMP POSTER.

The Frank E. Bundy Lamp Co. of Elmira, N. Y., is sending out a new hanger advertising the Bundy acetylene gas lamp. The hanger is lithographed in colors and shows a night scene in which abundant lighting of a dark street is afforded by the Bundy lamps on the machines of a couple of cyclists and on the carriage of a hackman.

#### TRADE NOTES.

The Shelby Cycle Co., of Shelby, O., shipped three carloads of bicycles to Paris last week.

The Eclipse Bicycle Co. of Elmira, N. Y., recently received an order for about forty bicycles from the island of Trinidad.

The Black Mfg. Co. of Erie, Pa., is working 700 men double turn, and recently refused an export order for 20,000 machines.

The Remington agency in Philadelphia, formerly in the hands of George Foley, has been transferred to Shannon, the Market street hardware man.

George W. Helmer is representing A. Featherstone & Co., of Chicago, in Mexico, where he is appointing agents in the various commercial cities of the republic.

Guy L. Bunch is about to open a first-class bicycle store and repair shop in Raleigh, N. C., and desires prices and discounts on bicycles and specialties from manufacturers.

The A. J. Lucia Cycle Co., of Green Bay, Wis., is opening a large bicycle and sporting goods emporium in a new store recently leased. Bicycles of home manufacture will be handled.

The Garland Cycle Co., of Waterloo, Ia., is getting ready for a prosperous business, it having already started on a lot of 300 machines to be ready when local trade opens in the spring.

W. S. Cranmer of Cedar Run, N. J., catalogues four patterns of bicycles—a pair each of Cranmer and Favorite machines. The Cranmer models list at \$25 each and the Favorite at \$35.

The National Cement & Rubber Mfg. Co. of Toledo is proud of the fact that while a comparatively young concern its business interests are not now limited to this country. It states that it constantly ships goods to almost every civilized country on the globe.

The Hollenbeck Saddle Co. of Syracuse has engaged Archie Hughes of Syracuse to act as general traveling representative. Mr. Hughes is very well known and popular in the trade, having been connected with W. D. Andrews, the largest bicycle dealer of Syracuse.

The National Sewing Machine Co. of Belvidere, Ill., is rapidly extending its export business in Eldredge and Belvidere bicycles. A fortnight ago a shipment of 250 machines was made to Paris to fill an order, and an order was recently received from Milan, Italy, for forty bicycles.

E. H. Ehrman of Walker & Ehrman, Chicago, has been granted a patent on the Walker & Ehrman seat post clamp. The expander has a direct binding action, the post being tightened by screwing the actuating nut downward to force a taper sleeve, against whose top it binds, into a taper seat formed between the outside shell of the expander and the seat post.

#### Seeks Hints from Employes.

The Overman Wheel Company has a novel method for obtaining suggestions for the operation of the minor phases of its business from its employes. It offers cash for such suggestions as will lead to improvements. Boxes are placed in each

room in the factory and blanks are procurable for those who desire to offer hints. Any suggestion which may be used by the company with profit or which in any way will facilitate the work in the factory is liberally paid for. Some such stimulus as this is needed, for in many cases the employes are in considerable fear of the foremen, who are contractors, and naturally they do not desire to run counter to their interests, for by suggesting methods by which work could be turned out more economically than at present the tendency would be to reduce the contractor's profits and make the position of the one giving the hint insecure. The scheme has been in operation for a month. Awards are made once a month.

**TO IMPROVE DISTRICT ROADS**

**Plan to Use Worn Granite Blocks and Asphalt on Main Arteries Leading Into Washington.**

Washington, Feb. 27.—The wheelmen of Washington are greatly interested in a recommendation made by the Board of Commissioners relative to the roads leading out of the city. Several of these roads have such a large traffic that macadam seems to be insufficient to stand the wear and the commissioners recommend that granite blocks from the streets within the city be removed and used upon the country roads. The surface of these highways need not be more than 30 feet wide, and if the granite blocks were used to pave a 10-foot strip on either side it is believed this portion of the road would be practically removed from the cost of maintenance. A 10-foot strip of asphalt or asphalt block laid down in the middle would give a smooth way, the cost of maintaining which would be no greater per square yard than the cost of

keeping in repair the same amount of macadam roadway.

There are 207 miles of suburban streets and country roads to be cared for and Congress appropriates only \$241.54 per mile for maintenance. This is insufficient and as a result the roads are in anything but good condition. Wheelmen hope that the above suggestion will be carried out and they will urge early action in the matter.

**MISCELLANEOUS.**

Advertisements under this head 5 cents per word first insertion, 3 cents per word each insertion thereafter. Cash with order. Express orders, postoffice orders, or stamps received.

**WANTED**

**WANTED**—Salesman to carry complete line of bicycle sundries on commission. CLARK, HORROCKS & Co., Utica, N. Y.

**WANTED**—Already established wholesale bicycle dealer, in the Netherlands, will take on a few more choice American lines of sundries to job in connection with regular trade. Mail catalog and export quotations. Satisfactory American references given if business results. J. C. VAN OUDENALLEN, Frombergstraat No. 2, Arnhem, Holland. 2

**WANTED**—A mechanical engineer, having made the horseless carriage a study, desires a position as salesman or mechanical engineer. Has important improvements and inventions he wishes to carry out. Has a good technical and practical training in mechanics; eighteen years' experience with electric, gasoline and steam motors. Address AUTOMOBILE, care Cycle Age. 1

**WANTED**—Salesmen and traveling men to take orders. Address CHAS. A. BRAUCHLER, Mr. Hollow Needle Tire Mender, Canton, Ohio. 1

**FOR SALE**

**TO EXCHANGE**—100 seamless forksides to exchange for sundries. Box 564, Louisville, Ky.

**CLOSING OUT SALE**—Until closed out, we shall offer the following: 600 pairs finished, flat cranks, regular thread, rights and lefts, at 20c per pair, 6 in.; 2200 pairs brazed forksides 1 1/2 in., 10c; 350 pairs brazed forksides 7/8 in., 10c; 4360 seat post forgings, 2c each; 630 crown forgings, 2c each; 2700 pairs upper back stay forgings, 1c each; 2200 lower adjustment forgings, 1 1/2c each. CORTLAND CARRIAGE GOODS CO., Cortland, N. Y.

**FOR SALE**—500 up-to-date '98 wheels in lots of 25 or more. Bargain for spot cash buyers. Address Box 472, Canton, Ohio. 2

**We Quote**

an extract from a catalogue just at hand of a well known manufacturer of the bevel gear type of chainless bicycles, on the necessity of ADJUSTMENT in all forms of gears.

"The reader is doubtless a bicycle rider and the possessor of a first-class bicycle, having ball bearings, perfect bearings. The balls hard as glass and the cones and cups properly tempered. The bearings doubtless run perfectly, give satisfaction, and are as good as can be made. DID YOU EVER ADJUST THOSE BEARINGS? Would you buy a bicycle having no provision for the adjustment of its bearings? Would you buy a chainless bicycle, whose gears are pins or rollers, with no provision for adjustment or taking up the wear, because you were told that no

wear will occur and no provision is necessary? What a fine rattle trap you would have in the course of six months! Ball bearings, universally used in cycle construction, and recognized by everybody, mechanical or un-mechanical, as being the perfection of simplicity and durability, minimizing friction, wear and trouble, require adjustment, as is well known. Any piece of mechanism that performs work or transmits power will sooner or later require adjustment, if used at all, and when said adjustment is not provided for, the so called mechanism is simply a trap."

**NOW READ**

our advertisement in this paper of February 2nd and draw your own conclusions as to the superiority of the Bullis Ball Gear over all others.

**"What Would you think of a Bearing Without an Adjustment?"**

All forms of roller gears are in this class but ONE—The Bullis Ball Gear. "The Bullis Bearing Gear" has an independent adjustment of every ball and cone. No rattle. Purely rolling contact. Friction eliminated. Write us.

## ADOPTS AGGRESSIVE TACTICS

### Buffalo Department House Bidding for Trade on Its Own Product—Clearing Fall Stock.

Buffalo, March 6.—“Buffalo’s Great Department House” introduced its advent into the cycle making business last week in the following rather terse terms:

“We are pleased to announce that we are manufacturing bicycles for the season of '99. Our bicycle business has grown to such an extent, not only in our retail but also in our wholesale department, that in order to give our customers the best bicycles that could be produced we have found it necessary, after carefully considering the subject in all its phases, to own and operate a complete bicycle factory instead of having them manufactured for us as heretofore.

“We use only the best material throughout and also employ only the most skilled labor. Our bicycles are sold in connection with our immense business in other lines and we also give the trade absolutely the best that can be produced for a reasonable price, which has always been beyond the possibility of the exclusive bicycle manufacturer.

“We desire to state that the above is made possible by the advantages of our cash purchasing power and the economical plan on which our factory is run. Our experience has taught us that quality and price are the best salesmen. We are now in a position to give our customers better service than ever before.”

#### Likely to Cause Price Cutting.

Sunday a week ago it came out in the daily papers with the following announcement, which is the forerunner of what promises to develop into an early and sharp war of prices with those concerns that carry the cheap grades.

“To celebrate the opening of the bicycle department and start the season with a rush, we shall place on sale Monday morning 100 high grade wheels for men and women at \$18.

“This is the lowest price ever made at the commencement of a season for strictly high grade, fully guaranteed bicycles. They are well made in every respect, including 22 and 24-inch frames made of Shelby seamless tubing, one-piece hanger and 2½-inch drop to hanger.”

#### Thought to Be Hold-Over Stock.

The machine that is offered for this money is believed by the dealers to be part of a lot of about 500 that the company purchased late last fall, which were then offered at \$15. The store, it is understood, got caught with 300 which it was obliged to carry over to '99 and which it is attempting to dispose of at an advance in price.

Later in the week this card was followed with a display advertisement reading:

“We believe in starting the season with a rush. We’re getting it. This store is pre-eminent in its command of good wheels, partly because we’re manufacturing for ourselves on a large scale, and partly because we’ve a tremendous outlet here for high-grade bicycles at a popular price. It is fair to expect that the success of last year will be very largely discounted this spring. Mail and telegraph orders carried away others, and altogether we had the biggest kind of business all day long.

“We have several kinds of wheels here, but special interest is centered just now on these two: Special bargain at \$18, strictly

high grade, and new 1899 models at \$25, our own manufacture.

“In addition to bicycles of our own manufacture we’re sole agents again this year for the well known \_\_\_\_\_ wheels, comprising 12 models of new and advanced construction and of the highest type—a variety not offered by any other concern in the world.”

These announcements have stirred up the trade generally and the prices are being met by some with a machine of superior qualifications and by others with one that is an extraordinarily poor example of the art of cycle construction.

#### Scramble for Orders Grows Easier.

The \$1 down and \$1 a week plan for retailing bicycles, which has been in successful operation here since the beginning of the year, was discontinued on the last day of February by the largest of the stores selling under the system. On this day the agent adopted an advertising scheme which was an unqualified success so far as attracting the public attention was concerned.

Outside of the store, in full military regalia, with the regulation arms and military tread, paced a soldier of the guard whose evident purpose was the guarding of the show window which was strewn within with silver and paper dollars together with placards announcing that it was the last day that bicycles could be bought under the plan and that it was desired to sell 100 bicycles before the close of the day. The success met with in the matter of selling the 100 machines is not known but it was a good scheme for advertising his store.

#### Purchase of Red Cross Co.

The entire business and goodwill of the National Red Cross Cement & Rubber Company of Rochester, N. Y., were purchased last week by the National Cement & Rubber Manufacturing Company of Toledo, O. The purchase includes also all names, trade marks, patents, patterns, etc. The manufacture of the Red Cross specialties will be continued hereafter in the Toledo plant of the National company under the same name and all orders received and shipments made from its offices in Toledo.

## CURBSTONE AGENTS INACTIVE

### Kentucky Dealers Find That the Installment Payment System Gives Needed Protection.

Paducah, Ky., March 6.—The curbstone dealer is gradually becoming extinct here. The principal reason for this is that 75 per cent. of the machines here are purchased on the installment plan. The first installment payment is usually from \$10 to \$15 and subsequent payments \$2 a week. Such curbstone agents as have threatened the business of the regularly established dealers usually sell cheap machines, and the dealers have lost no opportunity to convince the public at large of that fact.

The department stores sell a few cheap machines to country customers hereabouts. There is no demand for tandems. At one time and another four such machines have been purchased. Now they are for sale, with no buyers.

#### Irregular Repair Prices.

Paducah with its 25,000 inhabitants has for years been noted for its fine gravel streets and flourishing bicycle trade. There are six dealers, four of whom do a good business. Repair work is looked after by half a dozen shops. An effort was made last year to regulate the prices on repairs by adopting the list which was made standard in Toledo in 1897, but some of the smaller shops thought they would be unable to obtain work except by cutting prices, and so the effort at organization collapsed. At present repair prices vary from 25 to 40 cents for single spokes put in, with a charge of 10 cents each for more spokes. Valve stems are fitted at prices ranging from 25 to 40 cents, and inner tubes at prices ranging from \$1 to \$1.50. The cost of straightening frames is from 50 cents to \$1.50; front forks straightened, 50 cents to \$1; wheels trued, 50 cents to 75 cents; vulcanizing, 50 cents to \$1. This sufficiently indicates the irregularity of repair prices.

#### Exchange Allowances.

The exchange of second-hand machines last season cut less figure than in 1897. No more was allowed for such machines than the dealers felt sure they could obtain in selling them with repairs added. There were a few instances where dealers fictitiously listed new models so that they could offer big prices to customers with second-hand machines for exchange.

At the present time the streets are torn up. For the past six months local authorities have been putting in sewers and indications are that the streets will not be suitable for cycling for at least a year. In spite of this drawback, however, the dealers are looking for good trade as soon as the weather breaks. Given the same street conditions that existed in 1897, the cycle trade would increase 30 per cent. this year with machines selling at their present prices.

## A PROMISING OUTLOOK

### Opinions of a Salesman Who Has Traveled Extensively Among Cycle Dealers

To the Editor—From close observation and lengthy talks with hundreds of dealers, there is no doubt in my mind but that this year is going to be one of the best the bicycle business has ever known. The reasons for this promising outlook are many and manifest. General prosperity reigns, the prices of bicycles are low, the war is at an end, and there is almost universal confidence among the dealers.

#### Dealers Are Confident.

Manufacturing communities are the first to feel the benefits of the dawning good times. Factories that last year were running with a short force, and sometimes on short time, are now running full force and often over time. In a great many of them wages have been increased. The small town that owes its maintenance to four or five of these manufacturing institutions feels the change almost instantly, where as in most things the small town lags behind. To my mind this accounts for the unanimous opinion of the cycle dealers, irrespective of the size of their town, as to the good year's business in store for them. And isn't confidence a most necessary condition to a successful business? This confidence shows its good effects in the manner in which the dealer orders.

#### Sample Orders Are Plenty.

In no previous year in the history of the bicycle business have the dealers had a more pronounced or definite policy. All seem to know just about what they are going to do and what they want. Contracts for specified quantities and shipments are not as plentiful as in the days of the old boom, but sample orders are generous, and nowadays when an agent takes on a sample line of machines he usually intends to give that line equal representation with his others. The sidetracking of a line is, generally speaking, a thing of the past. Dealers are not so numerous as heretofore, those that only nibbled at the business not finding it profitable enough to continue. Of course there are occasional exceptions to this condition, but in the majority of places it is true. Curb-stone dealers seem to be gradually becoming extinct, evidently not receiving as much encouragement from the manufacturer as in the past. All of which materially helps to make the sound dealer feel pretty good.

The existing low list prices on standard goods would make it seem that the people who have waited for years until "good machines will sell at \$25 and \$35" are to be rewarded at last. In them, and in that class which never buys anything on installments and yet could not pay the previous higher cash price, there exists a new list of customers for the dealer.

#### Mail Order Houses in Disfavor.

Riders who last year bought the cheap machines sold by some mail order houses will this year become the customers of some local dealer. These cheap models, with unguaranteed tires and other equipment to match, have proved anything but satisfactory. One dealer and repairer told me that he actually made more money off the riders of cheap mail order machines shipped into his locality than he

would have made if he had sold such people a low priced machine. He claimed that there was hardly one of them but had to purchase a new pair of tires in two or three weeks after receiving the machine. This and the other repairs necessary from time to time, though small in themselves, aggregated quite a respectable profit during the season, and in the end cost the rider more than a good bicycle bought at home would have cost. These riders find it cheaper to have the repairs made at home than to pay the express charges both ways on a machine, the seller of which advertises all repairs free of charge. The new riders in the majority of cases will buy \$25 or \$30 bicycles. The rider of cheap machines last year is likely to join the old rider and purchase a mount listing at \$40 and \$50, while those that have an idea that the high priced machines only are good enough for them will divide their patronage between the numerous \$55, \$60, \$65 and \$75 models, according to their prejudices and pocket-books.

That the war hurt the business last year is beyond argument. Almost any dealer can tell of sales lost through some young fellow going to the front and leaving his machine to some friend. Others sold at a sacrifice, desiring to raise a little ready money, and so blocked sales by dealers. Many who had intended to purchase were summoned to war. And if the boys had not been called away, how many more wives, sisters and sweethearts would have been riding and how much greater would have been the interest in cycling?

#### Profitable Work for Dealers.

The cycle store openings already held, perhaps more than any other one thing, give a practical foretaste of what may be expected in the coming season. I believe that, without exception, there were more machines sold and more general earnestness displayed by prospective buyers than ever before at these functions. I know dealers who were surprised at the number of sales made at these openings—sales where they looked for possible later buyers, deep interest where they looked for curiosity seekers. By the way, these general openings—a simultaneous display of the improved models by all the dealers in town, lasting a week—should be used more commonly among dealers and encouraged more by manufacturers. Though the displays, the decorations, the music, the advertising, and sometimes the souvenirs, all smack of the big cycle show, the results are entirely different. The expense is practically nothing. The public remembers the place they saw a machine that took their fancy. They become acquainted with the people they are apt to deal with, get an idea from the appearance and location of the store and have some notion of the responsibility of the dealer as a consequence. A show is the place to see things; the store is the place to buy things.

#### Why Trade Will Be Better.

I started to give some idea of why business would be better, and, though I wandered from the subject somewhat, I will display some idea of consistency by closing with a few more reasons, each small in itself, perhaps, but all tending to

help. Good roads are making slow but sure progress; towns that have had street paving are doing more of it; some of those that have never had any have contracted for some. Bicycles have in many places become a practical necessity and are more generally used. Like pins, it is a wonder where all the old ones go, and new ones must replace them.

TRAVELER.

### COLUMBUS' GENERAL OPENING

Rain Fails to Keep Lady Visitors from Cycle Stores  
—Many Sales Please Dealers.

The '99 selling season was opened auspiciously in Columbus, O., by a general house warming during the first four days of the month. From the crowds that flocked to the various stores, which were attractively decorated for the occasion, it would seem that the cycling fever is increasing rather than growing weaker, notwithstanding several croakers have written extensively to the effect that cycling is merely a fad and attempted to prove by comparative figures that it is dying a natural death.

Managers of the several stores report many actual sales to visitors during the week, amounting to several hundred in the aggregate. The weather was somewhat unfavorable, yet the stores were filled with as many persons as could be comfortably received, and a noticeable feature of the attendance was the large number of ladies. Basing their judgment upon the number of visitors, the business-like interest shown in the lines, material, workmanship and constructional features of the various models and upon the number of purchases made, the dealers prognosticate that this will be the best season the Columbus dealers have ever had.

Nearly every dealer in the city did a very good business Saturday evening and all feel that the opening was a success in every way.

A talk with some of the dealers disclosed the following:

That chainless machines will be ridden to some extent this year.

That 30-inch wheels will have a considerable following also.

That the demand for the very cheap machines is gradually dying away.

That medium-sized tires will rule as favorites this season.

That extra wide handlebars have had their day, and people are willing to accept a rational width.

That there is a tendency to decrease rather than increase the size of sprockets on chain-driven machines.

That very few tandems will be ridden this year.

That cranks will not be lengthened in order to allow of the use of extremely large gears.

That most people do not care to be bothered with a gear case.

That 22-inch frames are the most salable size.

That diamond frames will be ridden by not a few women who derive much pleasure from long rides.

### Fowler Nominated for Alderman.

Frank T. Fowler, president of the Fowler Cycle Works, was nominated for alderman on the fifth ballot Monday night by the Thirteenth ward republicans of Chicago. There was only a weak contest for the nomination, three other aspirants having waived their claims after the fifth ballot and making the nomination unanimous. Mr. Fowler is also president of the Illinois Cycling Club and the West Side Driving Association.

The Bavarian army has been supplied with cycles weighing about 22 pounds, fitted with 20-inch wheels and low gears.

## KIRK BROWN IS IN CONTROL WILL DIRECT DUNLOP AFFAIRS

He is Re-elected Vice President and General Manager—Company Affairs Are Very Satisfactory.

The success of the American Dunlop Tire Company has been wholly due to the intelligent work of Kirk Brown, the company's vice-president and general manager. Some time ago hasty contemporaries went out of their way to make it appear that Mr. Brown was in danger of being shut out of all interest in the company when the controlling interest in the concern passed from the Dunlop Pneumatic Tire Company, Limited, of London, to certain Canadian capitalists who are not otherwise interested in the cycle or tire business. At a meeting of the directors of the company held in Belleville, N. J., on March 1, Mr. Brown was re-elected vice-president and general manager.

The former manager of the Canadian branch of the business is continued in his position, but not as an officer of the company. The Canadian branch, as stated in the last issue of this paper, is to be formed into a separate company. The business in Belleville will be continued just as it is.

### Tribute to Mr. Brown's Ability.

The entire management of the company's business in the United States is left in the hands of Mr. Brown, and its policy and the conduct of the business will be determined by him. No more flattering tribute to the ability of Mr. Brown could be furnished by the new owners of the concern than is implied in his re-election and continuation in authority. During the New York cycle show, while Mr. Brown was in England, gossips who did not thoroughly understand the drift of affairs spread the story that the management of the company would fall into other hands, and color of truth was lent to this belief by the airs of importance which one of the alleged new owners gave himself at that time. No one who had knowledge of the difficulties which Mr. Brown, through persistent work, had surmounted took much stock in the stories which were being circulated to his disadvantage while he was not there in person to refute them.

### Satisfactory Company Outlook.

The business affairs of the American Dunlop Tire Company in the United States are, thanks to Mr. Brown's efforts, in a very satisfactory condition. Over one hundred of the leading bicycle makers and about sixty jobbers who sell bicycles with their own brand names are furnishing Dunlop tires this season. The business has increased wonderfully, due in large part to the fact that twenty-five traveling representatives have been on the road all winter preaching the Dunlop gospel. The firm has twenty-five distributing depots in as many cities of the United States. The factory at Belleville is working to its full capacity and the buildings are to be enlarged as soon as the busy season is over.

### Coventry Cross Company in Distress.

A receiver has been appointed for the Coventry Cross Company, which a year ago was regarded as one of the soundest and most prosperous concerns in the English cycle trade. The shares stood at a big premium and a dividend of 15 per cent. on the year's business was paid, besides the carrying forward of a large sum to the reserve fund. But the company

fell in arrears in the rent of its premises in London and the debenture holders made a motion for the appointment of a receiver, asking that the receiver be permitted to borrow funds for the purpose of carrying on the business. The ground upon which this was made was that a distress had been put in on the London property for rent, which made the debentures payable. The company was bound by agreement to use only tires made by certain companies, to which it was debtor, and had 600 machines awaiting tires for which there was no money, while wages were also due.

### CHAINLESS MODELS IN TACOMA

Dealers Who Violently Opposed Their Introduction Last Year Are Now Singing Their Praises.

Tacoma, Wash., March 3.—The chainless machine is making considerable headway here. One dealer has already sold five such machines, notwithstanding the fact that the weather has been exceedingly unfavorable for trade. The few chainless machines which were ridden here last year have given excellent satisfaction and the experience of their owners no doubt is responsible for the growing popularity of this type of power transmission.

There is a noticeable change in the opinion of local dealers with respect to chainless machines. Last year but few of them would speak a good word for the new model. Now, however, nearly every retail establishment is loud in its praises. One dealer, who last year was the leader of the opposition, now says that he and his fellows took that stand merely because the factories from which they obtained supplies were not in a position to supply chainless models. And this statement has a much more universal application than appears upon the surface.

### Lozier to Build Naphtha Engines.

Toledo, March 6.—The Lozier Manufacturing Company will soon begin the manufacture of naphtha engines for launches and power purposes, going into the new venture on a large scale. A portion of the Toledo plant will be devoted to the new venture. The engine to be manufactured is the invention of Superintendent G. A. Burwell, and will be known as the "Lozier." For the time being, the hulls of the launches will be built elsewhere, but as the business increases the Lozier people will give attention to building naphtha launches complete from keel to power.

Col. W. H. Raynor, of the company, says: "We will be ready to supply the trade by April 1. We feel that there is a large field for naphtha launches. We will make the best naphtha engine on the market."

### Sale of Arrow Plant Stopped.

The plant of the Arrow Cycle Company of Shelbyville, O., was about to be disposed of by the county treasurer to secure the payment of \$400 delinquent taxes last week when the Indiana State bank secured an injunction stopping the sale, giving a bond to secure the county. The works have been idle for a year or more, during which time the owners have been in court, and the bank appears to have an interest in the property.

The Metal Polishers' Union is again showing signs of activity in its crusade against makers of certain machines who have not fallen in with the views entertained by union workmen. In the east three bicycles are being extensively placarded as being made by non-union labor, and intending purchasers are being urged to remember this fact when considering the purchase of a machine.

## DENVER OUTLOOK IMPROVING CHAINLESS CLAIMS ATTENTION

Many Orders Already Placed—Dealers No Longer Pin Their Faith to the Cheaper Grades.

Denver, March 6.—While it is true that all local dealers of prominence were represented in the show held during the week of February 20 to 25, the full attendance at the close of the week was found to be much smaller than at last year's show. The motor vehicles were responsible for a large part of the attendance, which otherwise would scarcely have paid expenses. Among the cycles displayed almost the only interest shown was for chainless models. The riding public seems to have decided that the best bicycle is now, or will soon be, the chainless in some form, to be judged by the results of the riding season which is now at hand.

A prominent dealer declares that he has booked more orders for chainless bicycles than he has for his best chain driven machines. Other dealers who handle chainless machines report flattering results and have discarded the sceptical ideas that were firmly rooted last year and now welcome gladly the new candidate for recognition.

### Buyers Will Want Reputable Goods.

The cycle show demonstrated that the bulk of business will be done in the higher priced machines, and that the cheaper goods will command only a light trade. A tendency to notice only those bicycles built by the makers of reputable goods of known quality in the past was also manifest. Some business was done by those firms represented at the show, while some manufacturers who were not represented directly have a few orders to show for the interest developed by the exhibition.

The prospects of increased trade for the coming season do not warrant a statement that more business will be done, measured in dollars, than last year. The number of sales will be increased, it is true, but the cost of doing business will necessarily be increased over the previous year because more customers must be handled and incidental expenses will be increased in proportion. If the Denver dealers can show a volume of business at the end of '99 equal to that of '98 they will be fortunate.

### Experienced Dealers Wary.

The second-hand and trading business is being reduced to a more satisfactory basis. Several prominent houses refuse to accept second-hand machines and most of the others will not allow more than 25 per cent. of the price of the new machines for any second-hand bicycle, and will not allow even that much unless the old machine will sell for an equal amount.

The instalment business presents two directly opposite phases. Several firms which have recently ventured into the cycle trade boldly announce that they will sell all bicycles at list prices and require a payment of but \$5 down, and the balance in instalments of \$2 per week. Others, who have been through the mill, insist on a payment of one-third down and the balance in \$10 payments per month, adding \$5 to the list prices on all time sales.

The desire to have lines of medium and low-priced models which was manifest earlier in the year has largely altered in favor of the standard makes, although many dealers have taken up the cheaper class of goods who are in a position to handle the trade of the small outlying towns of the state, and they anticipate satisfactory results from this source.

# The Crescent Bicycle

## FOR '99.

All the Essential Qualities of an Ideal Bicycle are United in the Crescent.

*Our Fine Illustrated Catalogue No. 2 containing The Care of the Wheel, FREE.*

### STRENGTH

The frames are made of cold-drawn seamless steel tubing modeled on lines giving maximum of strength with minimum of rigidity.

### SMOOTH-RUNNING GEAR

The gears and chains are so perfect that once adjusted the longer they are used the more easily they run.

### SIMPLICITY

The less complicated the construction of a wheel the less liability to breakdowns. Simplicity and durability are marked features of the Crescent.

### BEAUTY

The lines which make the Crescent model for '99 the strongest wheel make it also the most beautiful wheel. Every bar, rod and cone is exquisitely finished.

# MILWAUKEE TIRES

## PUNCTURE PROOF

Pneumatic

Resilient

Single Tube

Easy Riding

COPYRIGHT 1898, BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.

### PRESENTING TESTIMONIALS.

NORTH MILWAUKEE WHEELMEN.  
 GERHARD AUSSEM, President. H. SOULEN, Secretary.  
 E. W. SCHREIBER, Treas. and Capt.  
 NORTH MILWAUKEE, Wis., Dec. 1, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
 Gentlemen:—In reply to your valued favor of 1st inst., beg leave to say that I have used one pair of your Patent Puncture-Proof Tires for the season of 1898. I put the tires on my wheel April 1st, 1898, and have left them on ever since, never having an occasion to remove them and have ridden them over 2,000 miles over both city and country roads without receiving one puncture. Personally I would not be without a pair of your tires and will cheerfully recommend them to my friends. I have given your tire a thorough test and my experience has been that the tires are resilient, strong

and as near puncture-proof, if not absolutely puncture-proof, as any tire I have ever seen.  
 Respectfully yours,  
 (Signed) GERHARD AUSSEM,  
 President North Milwaukee Wheelmen.

EVANSTON, ILL., Dec. 10, 1898.  
 MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
 Gentlemen: In reply to your letter of Nov. 30th, I beg to say that your tires which I purchased some time ago look to-day as good as new.  
 An Ajax wheel, which I have fitted with a pair of your Milwaukee Patent Puncture-Proof Tires makes a wheel fit for a King.  
 Yours truly,  
 (Signed) NELS SWANSON.

Representatives Wanted. Write for Prices and Other Information.

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## VALUE OF INSTALLMENT SALES

Impressed chiefly with the losses which inevitably attend the sale of bicycles on the installment plan, a dealer writes to the Cycle Age deploring the existence of this well-grounded custom and prophesying its complete extinction within a very short time. In pleading for the abolition of the lease-hire system it is obviously meant to be understood that the correspondent intends his argument only to apply to high priced machines, for it is inapplicable to cheap goods since they are largely sold for cash. This view of the subject is taken:

The evils of the installment payment system are manifold, and instead of growing less, with experience as a teacher, they seem to have been aggravated. When high grade machines sold for \$125 or \$150 and afforded a good profit for the dealer, he was practically safe in selling on the part-down-long-time plan for two reasons—one that he could demand enough cash down so that the installments would make him solid on his cost in a short time, and the other that few people dared to venture the purchase of a machine unless they saw their way reasonably clear toward the settlement of the debt within the allotted time. The dealer thereby secured good customers and was willing to accede to any reasonable request for credit.

Now, however, the dealer's profit is smaller and his customers are people who strive to have everything and pay as little as possible, and it is this class, adding their weight to the short profit of the dealer, who are overbalancing the scales which have number-of-sales in the opposite pan.

Bicycles are now at a price where the person who can afford to own one can pay cash for it, and the dealer cannot afford to sell those who cannot pay in that manner. When a dealer at the close of a season looks over his stock and finds even a small number of machines back on his hands, while only a few dollars have been paid on them, and they are in a condition which precludes their being sold again except for a very small part of their original price, he feels aggrieved. The machines which are well cared for by the installment purchasers are the ones which are paid for, while the misused machines are the ones returned by the people who never intended to finish their payments, but have ridden out the worth of what they paid.

It is these returned machines, in such condition, which stir the soul of the dealer within him. He is avowing that he prefers to sell less quantity (if that be the necessary result) and know for a certainty where he is at, than to run the risk of a big business with the profits on the wrong side of the balance sheet.

It is easy to find fault with the installment payment system, but it is correspondingly difficult to replace it with some other method of sale which will not seriously impede or cripple the business of dealers. Selling for cash might breed troubles compared with which those now endured in selling on installments would indeed be trivial. In the absence of the credit system dealers would be deprived of the aid of one of their most useful methods for decoying purchasers, and the volume of sales would be very apt to shrink.

The price of high grade bicycles is yet too high to seriously entertain the idea of violently putting away the installment payment system. Firms which resolutely set out to conduct a retail cycle business without the services of a book-keeper or collector may flatter themselves that they can be independent of customers who purchase high priced machines, but the growing competition in cheaper grades, and the shrinking margins of profit which are obtainable through their sale, will in the end react strongly in favor of high priced products. It is the general testimony from all parts of the country that a decided fillip was given to the sale of high priced machines this year through the accommodations which dealers extended to purchasers. For months past small weekly deposits from customers have been sought by agents, and as a result cheap priced goods have suffered in the face of this competition. It may be urged by those who advocate the abolition of the installment payment system that this state of affairs cannot continue indefinitely, inasmuch as the dealers are practically made the bankers of the riders, but the change will not come while the purchasers of high grade bicycles are heavily recruited from a class which has tastes out of proportion to wealth. Moreover, the favors are not all

on the side of the buyers, for at the time machines are delivered to riders under the early contract system they are not fully paid for, and hence the dealer is fairly entitled to the use of money which has been advanced to him, especially since he is bound to carry the risks for some time to come.

Granting, then, that the abolition of the installment payment system would only affect purchasers of high priced machines, is it not natural to conclude that the retail trade would be in danger of being afflicted with the presence of curb-stone agents as competitors in the sale of such goods? The curb-stone agent in order to thrive at his unsanctioned profession is under existing conditions debarred from extending credit and consequently is driven to handling the cheaper class of machines. Manufacturers are fighting shy of him and his occupation is almost gone. If, however, high priced machines were sold for cash, the curb-stone agent would in all likelihood again be strongly in evidence.

## SPRING DELIVERIES ARE SLOW

Some bicycle makers in the middle western states complain that assembled goods are accumulating in the factory, while others, apparently no stronger before the trade, testify that shipments are unusually heavy. These opposing reports are typical of the methods practiced by energetic and lethargic manufacturers. It would seem that the concerns which have given especial attention to the securing of sample orders are now enjoying the benefits of their work, and, while they cannot boast of heavy deliveries, still the accumulated sample orders amount to a very respectable volume of business which later will undoubtedly be swelled to much greater proportions. The establishments which, on the other hand, have principally sought to obtain outright contracts have fallen short in their expectations and are for the moment without sample orders or instructions to ship on contract.

It is a demonstrable fact that it does not pay nowadays to urge agents to make heavy purchases early in the season, firstly for the reason that they are disinclined to carry stock long in advance of the time when it is salable to riders, and secondly because the average manufacturer's reluctance to tie up money in large purchases of material ahead of the season when he can sell his product to dealers. Heavy deliveries of goods from factories, therefore, do not usually take place until the beginning of April, and then should, barring accidents, continue steady, for dealers are very sanguine of a good season.

## COST OF ILLUMINATING STORES

What makes the best and most satisfactory light for a store? This question was recently asked in a meeting of Ohio dealers. One of those present stated that two years ago he had put in a gasoline plant costing \$70, with which he is now lighting his store at a cost of not over 1 cent per hour, with gasoline costing 10 cents a gallon. Another declared that he had a gasoline plant which furnished light until 1 o'clock at night which cost him 75 cents per month. During the winter months, however, when the days are shorter, the cost of operating was \$1.50 per month. This machine cost \$60, and, like the first, is fitted with Welsbach mantles. A third dealer testified that he paid from \$18 to \$25 per month for electricity and from \$4 to \$8 for gas. One who had used coal oil, which had cost from 15 to 17 cents a night and had given great trouble on account of the care necessary to keep the lamps in good working order, said that last fall he put in an acetylene plant under a guarantee that it would not cost more than 20 cents a night. He found that it cost 45 cents a night during the first month of trial. Some alterations were then made, after which it cost from 15 to 17 cents a night, but the following month the cost rose again to 48 cents a night. In the meanwhile, however, the electric company in his town, anticipating the competition of acetylene gas plants, reduced the cost of lighting and furnished electricity at a cost of 20 cents a night. Then he threw out the acetylene plant and used electricity.

This whole subject of store lighting is attracting general attention throughout the country. A number of letters have been received by the Cycle Age requesting private information upon lighting cost, and in order that the trade at large may obtain the benefit of the thought which the matter is receiving dealers are requested to relate their experiences with the various plants which they have installed.

## BRAZING BY IMMERSION

### Advanced Practice in a Western Factory—Fork Crowns Successfully Brazed By Dip Process

When general experimenting with dip brazing began so many obstacles presented themselves that a number of faint-hearted shopmen were loath to proceed very far. However, as soon as the more diligent brought the process to a point where it could be practiced with undeniable success and economy, the doubting ones awoke to the fact that many of the seeming difficulties had been overcome by amazingly simple means. Indeed the small problems which now seem to hinder the general adoption of immersion brazing are in reality quite simple of solution and will in the near future be satisfactorily worked out.

#### Most Frame Joints Can Be Dipped.

It is occasionally pointed out that immersion brazing can never become universal because it is impossible by the process to braze all of the various connections of a bicycle frame. There are two ready answers to this objection. The first is that nearly all of the joints commonly used in cycle construction can be brazed by the dip method and that the economy of so doing makes it desirable to use the process wherever available, even though a few joints have to be flame brazed. Of course it is generally granted that the best factory policy is to have as few separate and distinct methods as possible for accomplishing the same results; but where there is a choice between an expensive and sometimes unsatisfactory method by which all of the work in one line can be done, and an economical and thoroughly reliable method which is applicable to nine-tenths of the work, it is the part of wisdom to use the latter method as regular shop practice and the former when absolutely necessary. The second answer to the objection is contained in the probability that constant experimenting will doubtless reduce the number of joints which cannot be brazed by the immersion process.

#### Brazing Rear Cross Braces.

In an ordinary diamond frame the only joints which cannot be readily dipped in a crucible are those at the cross braces between the rear stays and between the rear forks, and at the front fork crown. Yet in many shops the cross brace between the rear forks is now regularly brazed by dipping, the operation being simultaneous with the brazing of the hanger joints. The depth to which the hanger must be dipped in order that the brass may flow to the top of the hanger lug connecting the seat mast tube is in most cases sufficient to also cover the rear cross brace. If it is not, the brace may often be brought beneath the brass by dipping the frame at a different angle instead of dipping it deeper. No matter at what angle the frame is held when dipping the hanger the depth to which it is immersed is always more than enough by a liberal margin to cover the lug connecting the lower front frame tube. Thus if the frame be dipped only to a depth which covers the seat mast connecting lug, but at such an angle that the brass runs further back on the rear forks and not so far out on the lower frame tube as usual, the rear cross brace may be covered and brazed and but little if any more superfluous brass deposited upon the frame than by dipping merely to braze the hanger joints.

Whether the rear stay cross brace may be dipped at the same time that the seat cluster is dipped depends upon the height

of the frame, which determines the distance of the cross brace from the cluster.

#### Fork Crown Brazed By Immersion.

Some of the oldest dip brazers in the country have given up as impossible the brazing of fork crowns by other than the flame method, unless no objection is taken to immersing the entire stem. In the accompanying illustration, however, is shown the crown portion of a front fork which was recently brazed by the immersion process and in a manner which proved so satisfactory that it has been

ive experimenting and where the ingenuity of the workmen must occasionally make up for lack of certain appliances. The fork was brazed in the new factory of B. E. Harris & Co., of Chicago, in the circular dip brazing furnace described in Cycle Age of February 2, and which as soon as the plant was moved from the old building to the new location was installed. Its operation proved so successful that no other brazing facilities were provided at the time, and when in the course of the rush to turn out the first lot of frames for the season it became necessary to braze front forks the foreman of the frame room found that he was compelled to braze them by immersion or to rig up a flame brazing table. Being an ardent advocate of immersion brazing he determined not to resort to the old method unless absolutely compelled to do so. He gave the matter a little study and made a few experiments, and the next day turned out a large lot of front forks solidly brazed and every one as well exe-

FORK CROWN DIP BRAZED WITHOUT IMMERSING ENTIRE STEM OR BLADES.

adopted as the regular method of operation in the factory where it was accomplished. The fact that at least one immersion brazer is able to braze front forks, in the face of the many statements current concerning the impracticability of the feat, indicates that future experimenting and development may lead to ways and means whereby almost any form of joint imaginable may be successfully dipped.

The story of the fork illustrated is interesting because it shows that new and valuable facts are sometimes discovered in shops not fully equipped for exhaust-

cutted as the sample from which the photograph herewith was taken.

#### How It Was Done.

Though the method adopted at the time, and which has since been regularly employed, is contrary to many old time shop prejudices, the results obtained are ample proof of its reliability. The procedure was as follows: The fork blades were pinned to the crown as usual, but the stem was not placed in its seat. One man then held the stem with a pair of tongs and another the crown and blades, and simultaneously the lower end of the stem

# THE STERLING

## "BUILT LIKE A WATCH"

AS MEN AND WOMEN ADVANCE ALONG THE LINES OF CULTURE AND REFINEMENT,

there comes a taste for those styles in all articles of use that are out of the ordinary. It is universally conceded that the STERLING embodies an "individuality of style," a "compactness," and a "grace" that are not associated with other makes.

The progressive dealer derives a genuine pleasure in selling a wheel of this character, for he knows that it means "value received" to his customer, and that a staunch friend has been made for his house.

Our descriptive catalog and agency proposition will be submitted upon request.

### STERLING CYCLE WORKS KENOSHA, WIS.

and the upper end of the crown and blade group were dipped in the crucible. After being in the brass long enough for the parts to be heated to brazing temperature and for the brass to flow, the parts were removed, and before they had had a chance to cool below brazing heat were thrust together and the stem driven down to the bottom of its seat in the crown. The machining of the crown and stem having been well done in the first place the placing of the two parts together was but the work of a few seconds, and as soon as the parts had cooled the entire fork was as solidly brazed as if it had been pinned together in a jig of the most improved pattern.

Some may doubt the safety of brazing such parts without previously pinning them together, but the forks turned out in the Harris factory are as true as the general run of forks brazed after having been pinned together in a jig. The fork from which the photograph was taken was picked at random from a lot of over two hundred, and is so nearly accurate that nothing but filing and enameling need be done to it to make it ready for assembling into a bicycle. The main point to be considered in preparing fork parts for brazing by this method is that of machining the stem and crown so that they match properly.

**SOUTHERN REPAIR PRICES**

Charges That Prevail in South Carolina—Little Interest in Thirty-inch Wheels in Charleston.

Charleston, S. C., March 4.—Bicycles with 30-inch wheels are not gaining popularity in this part of the country. Dealers, however, carry a few such machines and the necessary material for making repairs in them.

The bicycle dealers here have never adopted a fixed scale of prices for repair work. The following charges, however, are in general use throughout the state, with some slight modifications here and there:

Frames cut down, re-enameled, plain colors, knocked down.....	\$4.50
Frames re-enameled, plain colors, knocked down .....	2.50
Frames re-enameled, plain colors striped .....	3.00
Frames re-enameled, fancy colors, striped .....	4.00
Taking wheel apart and putting together, extra .....	1.00
General overhauling, bearings only..	1.00
General overhauling, bearings and nickel cleaning .....	1.25
Truing and aligning frame .....	1.50 up
Truing and aligning forks .....	50 up
Spokes (one) .....	15
Spokes (two) .....	30
New rims, plain .....	1.75
Pair rims, plain .....	2.50
Truing wheel in frame (fair condition) .....	25
Truing wheel in frame (bad condition) .....	50
Punctures, double tube (laced tires)..	25
Single tubes, one plug .....	25
Single tubes, two plugs.....	35
Clincher tires .....	25
Morgan & Wright, valve and stem...	35
Cementing on tire .....	25
Vulcanizing, casing and repairing tube, small .....	50
Vulcanizing, casing and repairing tube, large .....	75
Vulcanizing valve stem, single tube..	50
Straightening crank .....	25
Straightening handle bar.....	25
Truing sprocket .....	25
Cleaning bearings .....	1.00
General overhauling .....	1.50
Cleaning spokes, varnishing rims and enameling rims .....	1.00 up
Chain guard complete and lacing .....	1.00
Dress guard complete .....	1.00
Lacing mud guard .....	50
Lacing chain guard.....	25
Rear stays .....	50
Pedal rubber put on .....	40
Repairing chain .....	25

**Eastern Dealers to Sell for Cash.**

The bicycle dealers in Beverly, Salem, Marblehead, Danvers and Peabody, in the state of Massachusetts, have combined for the purpose of conducting their business

on a cash basis. It is their intention to refuse to sell goods on the installment plan. They have also decided to maintain a uniform price for all repairs, and no credit will be given to customers who wish repairs made. Five cents will be charged for pumping tires. Dealers will furnish customers with the opportunity of pumping their own tires, but a charge will be made for the services of an attendant. The dealers claim that during the past season they have been doing little else than pumping tires for nothing.

**REPAIR PRICES IN CANADA**

No Movement to Adopt a Schedule in Montreal and Toronto—Prices Vary Little.

Montreal, March 6.—With the advent of spring there appears to be no general movement in the bicycle repair trade towards a regular schedule for repairs, as is the case in some cities of the United States. Notwithstanding the absence of such a schedule, the repairmen's prices do not vary greatly, and last year they were well maintained. Neither can Toronto boast of a fixed schedule, but a close calculation of repairs on standard machines in both cities would be about as follows:

Punctures .....	\$ 25
Vulcanizing .....	50 up
Valve .....	50
Valve stem .....	25
Inner tube put in.....	1.65 up
Outside cover .....	4.00 up
Cementing on tires, each.....	25
Valve cup .....	10
Link in chain.....	25
Extra link .....	10
Chain bolt .....	15
Chain bolt nut .....	10
Chain bolt .....	15
Axles for front wheel.....	50
Axles for rear wheel.....	65 up
Crank axle .....	1.25 up
Plain crank .....	1.00 up
Right hand crank .....	1.50 up
Cementing Grips, per pair.....	15
Straightening cranks .....	25
Brazing in two pieces of tubing.....	5.00 up
Brazing in two pieces of tubing.....	3.00 up
Enameling frames complete, black..	2.00 up
In colors .....	2.50 up
Striping, extra .....	50
Aluminum finish .....	3.00
Lacing chain guard.....	25
Lacing mud guard .....	65
Mud guard, wood only.....	65
Chain guard, wood only .....	65
One new fork side.....	1.50
Two new fork sides .....	2.75
Fork stem .....	1.35
Truing forks .....	75
New rim .....	1.50 up
New spokes, complete, each wheel..	2.00

**Advertising a New Store.**

W. D. Wilmot is a bicycle dealer in Fall River, Mass., who has the reputation of doing things in an original fashion. Recently he opened a new store and repair shop and naturally was anxious to get as much publicity as possible. Instead of buying large space in the daily newspapers, hiring musicians, or making use of any of the other recognized methods for gaining publicity, he decided to give the first 1,000 customers who visited his new store 1,000 free orders for some sundry, repair or service in his line. The list of gifts follows:

One guaranteed tire, 1 saddle, 1 handle bar, 1 pair pedals, 1 chain, 1 wood rim, 1 wood rim fitted, 1 pair rims enameled, enameling one bicycle black, cleaning one bicycle, nickeling one handle bar, 1 fork trued, 1 frame trued, 1 sprocket trued, 1

crank trued, 1 wheel trued, 1 puncture vulcanized, 3 punctures plugged, 5 new valves (wired in), 5 cementing on a tire, 5 front axles, 5 honing a razor, 5 to sharpen a pocket knife, 10 each of the following: Spoke put in, lace a chain guard, to sharpen skats, cyclometers, bells, adding machines, hanks lacing cord, rim cement, plug cement, patch cement, enamel polish, elastic bundle carriers, pairs toe clips, 20 pairs grips, 25 pairs scissors ground, 25 frame buffers, 50 bottles bicycle oil, 50 valves (not put in), 50 hand pumps, 50 plugs, 100 sticks graphite, 100 pairs pant guards, 100 free lesson tickets, 100 bachelors' buttons, 100 rolls tire tape, 50 spokes and nipples.

As a result Mr. Wilmot made 1,000 small cash sales in three days, and in the first ten days booked orders for 14 chainless machines. He will be glad to exchange ideas with any other active dealer, or send samples of his circular and gear table to any dealer sending a self addressed envelope.

**EASTERN REPAIR SCHEDULE**

Moderate Charges for Repair Work Adopted in New Jersey Town—Terms Strictly Cash.

Brighton, N. J., -March 6.—The cycle dealers of this city have adopted the following schedule of prices for repairs, which is printed on a card 22x12 inches and accompanied by the intimation, boldly printed, that the terms are strictly cash:

New rims, plain .....	\$1.50
Spokes in wheel.....	10@15
Cleaning and adjusting.....	1.00
Link in chain.....	10
Chain bolt and burr.....	10
Chain adjusters, per pair.....	25
Repairing inner tube of tire.....	35
Repairing single tube tire.....	25
Cementing tire on rim.....	10
New valve .....	25
Valve stem .....	25
Metal valve .....	50
Vulcanizing tire .....	50 up
Fork ends, each.....	50
Fork sides, plain.....	1.50
Fork sides, nickeled.....	2.00
Fork crown, plain.....	1.50
Fork stem.....	1.50
Cones and cups, each.....	75 up
Cotter pins, pair.....	26
Nickeled burr .....	10
Rear sprocket .....	1.25 up
Front sprocket, plain.....	1.50 up
Cutting down frame and enameling..	5.00
Plain enamel, three coats.....	2.50
Enameling and striping rims.....	1.00
Stained rims .....	50
Cranks, per pair.....	1.50
Axle for wheel.....	75 up

**Special Prices for Winter Work.**

A Massachusetts dealer and repairman makes a practice every winter of issuing the following special offers to his customers:

No. 1. For \$1 I will send for your bicycle and carefully store it all winter.

No. 2. For \$1.50 I will send for your bicycle, clean, oil and adjust all the bearings and store all winter.

No. 3. For \$4.50 I will send for your bicycle, clean, oil and adjust, enamel the frame and fork black or maroon and make no charge for storage.

No. 4. For \$6 I will send for your bicycle, clean, oil, adjust, enamel black or maroon, true both wheels, true frame, forks and cranks, repair tires if worth repairing, and make no charge for storage.

No. 5. For \$8 I will send for bicycle, clean, oil, adjust, enamel black or maroon, true both wheels, true frame, forks and cranks, repair tires if worth repairing, nickel plate all parts except spokes and hubs, and make no charge for storage.

No. 6. For \$10 I will send for bicycle, clean, oil, adjust, enamel black or maroon, true both wheels, true frame, forks and cranks, repair tires as above, nickel all parts, put all new spokes in both wheels, and make no charge for storage.

The bicycle dealers of Salem, Mass., at a recent meeting decided to close their stores three evenings each week during the approaching season.

## COMMERCE IN FOREIGN MARKETS

CYCLE FACTORY  
FOR  
SOUTH AFRICA

An attempt is being made to start a cycle factory in Port Elizabeth, South Africa, but judging from the following criticism with which one of the local papers greeted the venture, it is highly improbable that success will wait upon the effort:

During the past few weeks a circular letter has been distributed broadcast throughout South Africa by a firm styling itself "Tarry & Co., general merchants," whose address is given as Box 339, Port Elizabeth. The prospectus goes on to state:

"This company is formed for the purpose of establishing a cycle factory in Cape Colony, with branch depots (and subsequently factories) in Natal and the Transvaal, to make and place upon the South African markets good, reliable bicycles at a much cheaper figure than imported machines are, or can be, sold at. The sale of bicycles in South Africa has already assumed very large proportions, but the present high prices debar many from indulging in this most healthful, invigorating, and delightful exercise. The object of this company will be to manufacture in South Africa a machine the price of which shall be within the reach of all."

We are indisposed to occupy space with the absurd claims put forward in the prospectus of the South Africa Cycle Manufacturing Company, Limited, promoted by Tarry & Co. Bearing in mind that the raw material would have to be imported from Europe; that skilled labor in South Africa is only obtainable at a high salary as compared with rates paid in other countries; and that the laying down of mechanical appliances and their working, for the production of all or any of the multifarious parts of a cycle, would entail an outlay many times in excess of that in England, where wages are notoriously high, it is obvious that the capital of the proposed company is not only absurdly small for the purpose, even if it be all called up, but is barely sufficient to cover the expenses of the voyage of a staff of competent and skilled workmen and the purchase and laying down of the necessary machinery with which to commence operations. How, then, can the company claim to manufacture in South Africa a machine the price of which shall be within the reach of all at a much cheaper figure than imported machines are, or can be, sold at? Parts can, it is true, be imported and put together at probably less cost than a complete bicycle of repute; but, as the word "manufacture" is especially emphasized in the prospectus, we have only concerned ourselves with the literal interpretation which the word conveys. In our opinion, if the whole or any part of the money asked for has been subscribed by a confiding public, all the return they will get for their investment will be the winding up of the company almost as soon as it has commenced operations.

BICYCLE  
SALES IN  
SUMATRA

Cycling on the west coast of the island of Sumatra is principally confined to a small percentage of Europeans who are resident there. Some of the Chinamen born in Sumatra, however, are riding bicycles. There are perhaps seventy-five machines in use. An increase in the number is not probable until the price is considerably reduced.

The condition of the roads is good throughout the year. They are macadamized. There are no native bicycle makers or repairers. Most of the bicycles in use were brought to Sumatra by people employed in the government service or by passengers returning from Europe. Many varieties of machines are to be found. The number imported by shopkeepers will not exceed a dozen. Their sale is exceedingly slow. Some which were imported for sale were of Austrian manufacture, one of the retailing stores being a branch of a Vienna firm.

The duty on bicycles is 10 per cent. of the appraised valuation. The receiving port for the west coast of Sumatra is Padang, where every week a steamer from Holland arrives carrying the Dutch

mails. The only charge on inward goods is the landing tax. Goods not cleared by importers are stored in the bonded warehouses of the government and can be re-exported free of duty. There are six importing firms which might be induced to handle bicycles.

AMERICAN  
BICYCLES IN  
FRANCE

Bicycles are in general use in the department of Marne, which ranks third in France in the number of bicycles used in proportion to inhabitants. The first is Paris and the second Gironde. The roads are very good and are kept in good repair, but are rather hilly. There is only one local factory, and its product is not important. Three machines of American make are now sold to one of English. Bicycles enter this district from Havre and Calais. The best communication with the United States is via Havre. The freight by the Transatlantique Line, New York to Havre, is \$6 to \$8 per 40 cubic feet, in proportion to the importance of the invoice.

CYCLING  
IN THE  
TRANSVAAL

Johannesburg is the headquarters of the South African bicycle trade. The city is not really adapted for cycling, as the roads (and the word road in South Africa is largely a figure of speech) are extremely bad, the sandy soil making pedaling more a matter of undoubted exercise than of pleasure; but such a little detail as this does not damp the ardor of lovers of the wheel, and pedestrians are beginning to complain that the cyclists are taking up all the roadway to the exclusion of all else.

A Johannesburg peculiarity is the "bicycle raffle," which takes place every Saturday evening. The machines put up as prizes embrace all varieties, and are as a rule second-hand goods. These raffles are conducted fairly enough, but the legitimate business men naturally do not view them with favor.

Very few women ride in the Transvaal, and few of the cycle stores exhibit ladies' machines, though they of course keep them in stock.

Cycle stealing in the Transvaal has developed into a fine art of late, and it is an unusual occurrence for a week to pass without three or four convictions being recorded against these scoundrels.

The bicycle has also been put to use by highwaymen, two cyclists having held up the secretary of a mine and robbed him of several hundred pounds. In this case the thieves were captured before they had had time to get rid of much of their plunder, and they are now serving a long sentence in the Johannesburg jail.

The Boers in the up-country districts will not countenance the bicycle, and, in fact, many of them look upon it as an invention of the evil one; but the Dutch residents in the immediate neighborhood of Johannesburg and Pretoria have during the last three years taken to it, and the streets of Pretoria on a Sunday are simply crowded with young Boers, who have discarded the horse for the more handy bicycle.

At present the cycle trade in the Transvaal, in common with all others, is not flourishing, but the depression is of a temporary nature and when good times once more return, as they must before long, the cycle trade will be one of the first to experience the effects of the boom.

HIGHWAYS AND  
TRADE OF  
NEW ZEALAND

Nearly all the New Zealand roads are composed of shingle, which is obtained from river beds, but this has proved very unsatisfactory in the past, as these stones being water worn do not bind well, and this shows very much after any lengthy spell of dry weather. Then, again, cyclists in Canterbury province cannot undertake a ride of any length without having to cross water races, as there are almost innumerable in that country. They are supplied with snow water from the mountains and range on an average about seven to ten feet wide, and wherever you go you find these races crossing your road.

So far, this has been the worst winter for cycling since the pastime caught on with New Zealanders. The pastime is exceedingly popular, especially in Christchurch, where level roads are to be found in abundance and were the surfaces somewhat better, this town would be virtually a cyclist's paradise. It also boasts of having the largest number of cyclists in proportion to its population of any city in the world, but that is a matter not easily proved. All kinds and conditions of machines are represented, and the same can be said of tires.

Riding is practiced to a considerable extent in Dunedin, where the roads are of fine quality, but exceedingly hilly. One cannot ride out of Dunedin for two miles without encountering some very stiff grades. The other towns of importance are Wellington and Auckland, the first named of which has more dealers than any other town in the colony. Butchers, tobacconists, hardware dealers, dry goods stores and wholesale warehouses all represent an agency and in consequence the trade has been very much cut up, and exclusive cycle dealers have had a rough time in competition. The roads in the neighborhood of Wellington as well as the streets in the city itself are very poor.

There is a splendid touring country along the west coast of the north island. Along this route one strikes the most beautiful country in New Zealand. Somehow droughts never seem to affect this part of the colony. The roads are hilly and the scenery is singularly attractive.

The last town in New Zealand to take to the bicycle was Auckland, but it is by no means least in the point of the trade. Cycle stores are springing into existence like mushrooms.

IN SINGAPORE  
BICYCLES  
ARE COMMON

Bicycles are in general use amongst Europeans in Singapore, and even natives use them so far as their means will allow. The roads are fairly level and smooth, with few hills of little height. Most strangers declare they are ideal for the bicycle. There are no manufacturers. Bicycles are imported mostly from the United Kingdom, the United States, and a few from Germany. There is no duty on bicycles or on any other article entering Singapore from any part of the world, the port being free.

Singapore and Penang are the receiving ports in the Straits Settlements. Port charges are nil, as affecting importers. There are no bonded warehouses. Goods should be carefully packed in cases lined with pitch paper. Plated parts should be well coated with vaseline, and cases should not be stowed close to boilers.

## BASE AND SIZE OF WHEEL

### English Constructor Argues for Small Drive Wheel and Lengthened Base—Tall Riders' Machines

In regard to relative sizes of front and rear wheels on bicycles the well-known English bicycle constructor, P. L. Renouf, writes in *Bicycling News*: In the diagrams we will suppose a given load to be resting on the middle of a beam supported by a pair of wheels, of which the one towards the right-hand side is a driving-wheel, and the wheel on the left-hand side is opposed by an obstruction; the facility with which the front wheel will be pushed over this obstruction will depend on several circumstances: one is the relative size of the wheel to the obstruction, and another is the size of the driven wheel to that of the driving wheel. It is obvious, as the rate of rise will be in the ratio of the distance of the obstruction to the point of contact of the wheel with ground, the larger the wheel is the more easily will it surmount the obstruction; but on inspection of the diagrams, which represent an ordinary brick in contact with a 24-in., a 28-in., and a 30-in. wheel respectively, it will appear that there is not so much advantage with the larger wheel as might be thought. Though bricks have to be encountered sometimes, they are about the highest obstacles a machine may be fairly expected to deal with; in the case of lower articles the advantage of the large wheel is of course still less. We can therefore safely assume that our present standard size of steering wheel—28 or 30-inch—is quite large enough for a machine for one rider; a much larger front wheel entails bringing the head or steering socket out of reach, unless the angle and pitch of steering is made so violent as to more than counteract the advantage otherwise gained.

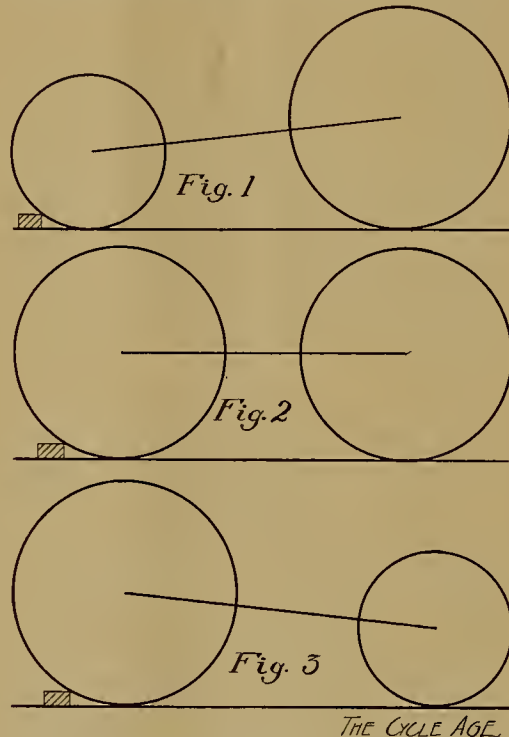

#### The Front Wheel's Resistance.

If we consider the sizes of the wheels relatively to each other, where the front wheel is lower than the driving rear wheel, the effect of resistance to the front wheel to the impetus of the beam is to make the beam and the back wheel tend to pivot on the front axle and jump up, or else, if kept down by the load, tend to buckle up the beam or frame—in both cases the obstruction will be pushed harder towards the ground.

Where the wheels are equal the tendency is to check the forward flight of the beam and compress it—on our cycles to push the front forks back, and create vibration by the reaction. But when the rear wheel is the smaller, and the front one is resisted, the beam will be driven forwards and upwards, with the result of lifting the front of the machine over the obstacle. Nor need the driving wheel be much smaller than the front one to produce this effect. We can ourselves experience similar effects by pushing an ordinary two wheeled (or even a one-wheeled) barrow, and letting our hands take the place of the axle of the driving wheels of our diagram: if the barrow is to be pushed up a curb, for instance, the hands are instinctively dropped below the level of the wheel centres: if the handles be held higher and not gripped tightly, they will rise up sharply when the obstacle is struck; if they are brought to the same level as the wheel centres, the shock will be perceptibly greater than in the first one.

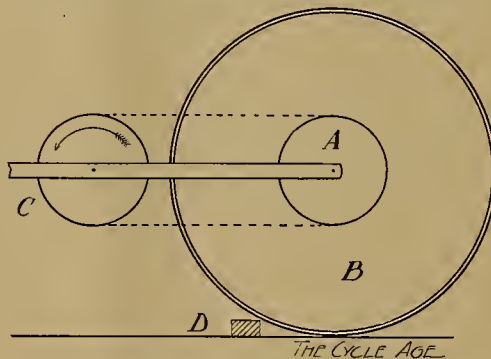

For road work, therefore, there is unquestionably an advantage in having the

driving wheel slightly smaller than the steering wheel, as a succession of small obstacles are being constantly encountered; besides this, the friction of the ground itself, which causes the front wheel to turn round, offers resistance in a small degree. I believe that the resistance as compared with the grip of the driving wheel is even on a smooth

racing track sufficient to render, if not an increase in the size of the steering wheel, a decrease in the size of the driving wheel of use.

The same writer discusses the position of the saddle and of the crank hanger in relation to the rear wheel axle. In former days, he says, the preconceived idea prevailed that the weight of the rider should be well over the driving wheel, but experience proved this to be wrong. Mr. Renouf holds that the weight of a rider must be well in front of the rear wheel center and his reasoning is given with reference to the illustration as follows: A wheel B is furnished with a pulley A keyed to it; a framework capable of motion about the centre of the wheel carries a pulley C (by

chain or otherwise in gear with the pulley B) and a motion (human or otherwise) rotating the pulley C. The rotation is productive of relative motion between the rim of B and the framework supporting C; that is while C revolves and the framework remains horizontal, as in the diagram, B must revolve; but it follows that if C revolve and B cannot move across the framework,

the latter must move across B, which it can only do by rising to a horizontal position. In other words, the action of pedalling on a rear-driving cycle tends to wind the framework and the rider up and over the top of the rear wheel. Supposing the weight of the rider and framework to be nearly balanced over the axle, the friction of the rear wheel on the ground would cause it to remain stationary, and the rider instead of propelling the driving wheel forward, would undoubtedly wind the framework backwards on its pivot. If a block D be held in front of the driving wheel, B will only surmount the resistance if the power on C is sufficiently strong, and if the weight on C is sufficient to prevent the overwinding before mentioned. And there can be no question that the best means of keeping the framework down is by bringing the load on it forward and as far from the rear axle as practicable.

The higher the speed at which a machine is propelled, the greater is the resistance to the driving wheel, and the greater the tendency to take weight off the steering wheel—and this is one of the several reasons why the racing men—to counteract this effect of speed—instinctively throw their weight forward as the speed increases.

#### Vibration By Unbalanced Design.

I feel pretty well convinced that the present tendency of bringing the saddle forward is largely due to the want of proportion in the average cycle frame of the day.

Supposing on anything else but a cycle a load were to be carried on a set of wheels. No one would ever dream of placing the support of the weight anywhere else than in the center of the carriage, and it is evident that if the center of gravity is raised above the supporting base, the latter—in this case the wheelbase—should be lengthened both fore and aft. If this is not done, the base will become more and more unstable, and this will induce vibration.

#### Renouf's Preferred Construction.

Now if we examine the standard machines of a standard manufacturer we are pretty sure to find three or more frames listed for riders of varying heights, but all with the same distance from bottom bracket to front and to rear axle—whether the rider be five feet or six feet high. The angle of the seat mast is the same and the result is that the tall rider has his weight nearer over the rear wheel axle than the short rider, and the burden and drag on the rear wheel are unduly increased.

The epitome of Mr. Renouf's reasoning is that standard frames of today are too short, and that a combination of 28-inch rear wheel with 30-inch front wheel over a wheel base graduated in length by the height of the frame would be preferable to a standard wheel base and 28-inch wheels fore and aft.

#### Bicycles Facilitate Mail Service.

In Germany, and especially in Berlin, the mail deliveries are made by postmen mounted on bicycles. The use of bicycles has enabled the city postoffice to make twenty-seven deliveries daily. A letter mailed in the city is frequently delivered to the addressee in the same city from forty-five to fifty-five minutes after having been posted.

Some of the employes of the National American Cycle Works Co. of Akron, O., have quit work because they were put on piece work instead of being paid for day work, and were unable to make more than about half as much as formerly.

Three thousand bicycles were stolen in England during 1898.

# WHAT WOULD YOU DO?

The only sensible way to coast is the safe way. The safe way is possible only with perfect control of the bicycle. The minute the feet are off the pedals the control is lost—coasting then becomes a danger.

Eclipse Cycles Fitted with

The Morrow Automatic Coaster and Brake

Make coasting a safe pleasure. It enables riders to hold the

pedals stationary while coasting. A slight back pressure of the pedals applies the brake. The bicycle can be stopped on the steepest hill in the shortest time and smallest space. Any wheel thus equipped can be sold—easily. All the particulars if you want them.

Eclipse Bicycle Co., ELMIRA, N. Y.

# Plain Talks on ANDRAE Tandems

XI.

Four years ago Andrae Tandems were like other tandems are to-day.

This is a strong statement—but we can back it up.

Take an Andrae catalogue of '95 (4 years ago) and a '99 catalogue of any other make, turn to tandems and you will see that—

The Andrae '95 Tandem has the Design the Other '99 Tandem is Copied from.

This proves without a doubt that others are four years behind us in tandem building.

But their tandem costs only \$75 while the Andrae costs \$85.

If a '95 tandem can be sold for \$75 a '99 tandem ought to be easy to sell at \$85.

Write for our paper, "The Andrae Agent."

Julius Andrae & Sons Co.

MILWAUKEE, WIS.

They Never Disappoint . . . .

## What the Sporting Editor of the New York Journal Says

GENTLEMEN :

After having used the '99 Olive for some time on country roads, park boulevards, asphalt and cobblestone pavements, I am forced to pronounce it the staunchest and easiest running wheel I have ever mounted.

As an all around machine it could not be more satisfactory, and its simplicity of construction is a feature that must commend itself to all.

Yours very truly,

HARRY BEECHER,  
Sporting Editor New York Journal.

AGENTS AND RIDERS ALIKE ARE ENTHUSIASTIC OVER THE '99 OLIVE WHEEL

The Olive Wheel Co., Syracuse, N. Y.

# The Watson Automatic Seat Post

The only PATENTED Automatic Seat Post in the world. Convertible to front or rear L. Locks and unlocks automatically and instantly. Made on the wedge principle, therefore binds equally its whole length, and can't bulge the tubing. Fits any wheel made. Our customers will confer a favor by informing us of any bona fide sale and delivery of a seat post similar to ours, as we shall positively prosecute any infringement on this post. In the United States we have two patents issued July 12th, 1898, February 28th, 1899, the third allowed and the fourth pending. Outside of the United States our post is patented in every country where bicycles are made. We have doubled the capacity of our factory and from this time on will be able to fill all orders promptly. We manufacture a Handle Bar on the same principle as the Seat Post, but are sold ahead until April 1st. Orders will be received for delivery after that date. Send for circulars and price lists of Seat Post and Handle Bar.

# The Types That Will Live

**W**E refer to saddles. What will they be? Do they now exist? These are questions that interest every manufacturer, dealer and rider.

There is no doubt that saddles, like watches, wagons, or washboards, will settle down to a few standard types. The freaks and follies of saddle invention have had their day and served the purpose of proving and accentuating the value of real saddles—the solid, straight-out, every-day-in-the-year saddles, such as we make.

The American Saddle Co. has no use for monstrosities. Its mission is, in part, to crystallize the sentiment of the public upon standard models, and to eliminate the multitudinous, and (many of them) useless styles now annoying the manufacturers of wheels and confusing the judgment of riders.

Our concentration process has begun, and instead of fifty or a hundred styles heretofore offered by our several companies, the number will be materially reduced, always having due regard for existing contracts.

It is our purpose to have comparatively few models, and those, such as have demonstrated their right to live.

## CUSHION EFFECTS IN CYCLING

### Spring Devices—Relations Between Speed and Comfort— Pneumatic Hub Wheels

Pneumatic hubs for bicycle wheels are looked upon with a good deal of derision by most bicycle riders. So are spring suspension of the wheel axles, spring frames and cushioning devices, except saddle springs. A minority, however, want something besides pneumatic tires to rely on for comfort in riding on rough ground; and a still smaller minority want something to replace pneumatic tires. In regard to spring devices it is now by most riders accepted as axiomatic truth that the three points of support for the rider, the saddle, the handlebar and the pedal shaft (crank shaft) should remain under all circumstances in fixed relations to each other, and spring devices which affect these relations are considered as inferior. The reason advanced for this view has reference to lost motion in the leg action, as between saddle and pedal, and insecurity of steering arising from springy action of the handlebar.

#### The Three Fixed Points.

The fact that the rider on an unyielding machine saves himself from jolts by throwing his weight on the pedal and partly rising from the saddle, thereby stretching his legs and practically changing the relations between the three supposedly fixed points, is usually not considered. If it were, it would, however, be shown that the rider's opinion is not so far from being right as it is insufficiently reasoned. For when the rider takes up a jolt by rising on the pedal he still has the choice of throwing his weight on one or the other pedal, and by throwing it on the pedal that descends he may utilize the shift of weight for propulsion. This he practically does. With many spring devices, saddle springs included, he has not this choice, but the saddle bobs up and down independently of the motion of the legs, neutralizing it as often as it helps it. To those who care for speed more in theory than in practice the spring devices retain their usefulness, only slightly handicapped by this shortcoming, which is offset by the great simplicity of the devices. In the spring frames which have gained most popularity in United States the invariable relations between the three fixed points are maintained and the absorption of jolts is effected either by shifting the point of ground support to a trailing wheel as in the Rex pattern of cycles or by allowing the rear quadrant of the frame a vibrating motion with the crank hanger as a pivot as in the spring frames built by several firms under Travis' patents.

#### Wood Frames Are Spring Frames.

In wood frame bicycles the springy action is evenly distributed throughout the frame and front forks, but the steering head is rigid. The peculiarity by which they recommend themselves is that the natural rigidity of wood of the dimensions necessary for strength excludes large vibrations, which might cause noticeable loss of propelling power, while its fibrous character admits of ready yielding within narrow limits. In this respect the action of wood frames has points in common with a hard-blown pneumatic tire, so far as the effect on the rider is concerned. The small shocks which in steel structures, as usually designed, take effect in that kind of internal, molecular vibration, that numbs hands or feet, is suppressed in wood. Whether it is pos-

sible to produce a similar effect in steel without sacrificing strength has not yet been sufficiently demonstrated, but steel on the other hand has the paramount advantage of producing uniform results and of being plastic in nature, so that it holds any form given to it. This makes it indispensable for joints. Its indifference to climatic changes makes it preferable for front forks and any other parts of a bicycle in which a definite curve must be maintained as the normal shape. For wheel rims steel would be preferable if steel rims could be made to yield so readily to small shocks as to save the spokes from sudden stresses and vibrations. The main advantage of the wood rim is in the fibrous nature of wood which allows it to conform to stresses over a comparatively large arc thereby distributing the stresses on many spokes and preventing molecular vibrations which with a steel rim would be communicated through front forks to the handlebar.

#### Public's Bias Only Skin Deep.

It is probably due to the influence of the racing game that the general riding

FIG. 1. WHEEL AND TIRE.

public has come to look askance at cushioning devices which are proclaimed as such. For it is noticed that the prejudice—if prejudice it is—is directed more against the word than against the reality, more against any definite appliance which is marketed as a cushioning device than against the cushioning effect obtained by a form of construction which passes current without mentioning the tabooed word. Were it otherwise, a large portion of the public would insist on hollow steel rims instead of wood rims, on rigid saddles instead of yielding ones, on small rake and curvature of front forks instead of the twenty degrees of rake and liberal curvature at the tips which is favored by many makers.

#### Spring Frames Unwittingly Favored.

A good deal of the charm of tandem riding is due to the softly undulating motion of this style of cycle and this motion, again, is not all or principally caused by the long wheel base but chiefly by the small rigidity of the long frame which yields almost four times as much under the rider's weight as the single diamond frame and responds to jolts much less sharply.

The small wave of popularity for round front forks made of taper gauge tubing, which is apparently spreading from England to this country, has no other foundation than the ease of riding and the

saving of shocks to the frame which are traceable to the springiness of such forks.

The public are more in favor of spring devices than they know. What they ask is such forms of construction as will give them easy riding without suggesting a charge of effeminacy and without sacrificing the possibilities of speed. And the construction must, of course, be sightly. They want proof on the race track and from road races and those manufacturers are therefore on the right trail who endeavor to prove that their cushioning devices or spring construction—under some other more attractive name—are speed producers and superior to those excellent natural springs, the rider's legs and feet.

#### Auxiliaries, Not Substitutes.

These natural springs of flesh and sinew have their highest efficacy only at high speeds when a comparatively small portion of the weight rests on the saddle. They are at a disadvantage if a jolt is received when the pedals are at dead centers or when the roughness of the ground is of that peculiar character that shock follows shock in quick succession, as on a frozen road or over cobble stones. Then the fastest riding is the easiest on man and machine, both; partly because the machine drops less deeply between the inequalities of the surface and partly because the rider is compelled to get above the saddle.

It is required of spring constructions that they shall permit the rider to pass easily over such ground at slow speed, and also that they shall not interfere with his riding fast over it if he chooses.

They must be auxiliaries to the springs in the rider's anatomy, not substitutes.

#### Springiness Without Vibration.

With this condition pneumatic tires and wood rims comply—largely because they are revolving parts of the construction—and this may be assigned as the main reason why they have been generally approved. Whether spring frames and springy front forks comply with the condition seems much more questionable. A tuning fork produces the same tone whether struck smartly or lightly. Spring frames respond to jolts with a resiliency which is determined by their own constitution and which does not necessarily correspond to the nature of the road surface over which the rider travels. Their resiliency may help or oppose propulsion as the case may be, because the spring—whatever its nature, if it always operates in the same direction—is not brought quickly enough to rest to be ready to receive the next jolt under the most favorable circumstances.

It is at this point that the rider's natural springs operated by muscular contraction and air confined in a circular form and receiving its impulses now at one point and again at another, have an advantage which riders have recognized by instinct or experience.

Producers of spring devices who can prove that their constructions have the same adaptability to all road surfaces will have a great advantage in the market, or, even if they may only prove that a portion of the speed check which a jolt ordinarily involves, is transformed by their devices into increased power for propulsion (as when the rider steps harder on the descending pedal at a jolt) their chances of convincing the public will be much increased.

#### The Pneumatic Hub.

Among the radical means for increasing the comfort of riding the pneumatic hub is probably as near to the mechanical requirements as anything else produced. It has taken commercial form in this country through the establishment of the Collins Pneumatic Hub and Wheel Works of Sayre, Pa., where wheels with

pneumatic hubs are manufactured for use in "bicycles and all other vehicles" on such a scale that the question of the fitness of the device is placed directly before the trade for its consideration.

The pneumatic hub wheel has against it that it differs in appearance from the usual style and that it is offered as a substitute for and improvement over pneumatic tires which hold a strongly entrenched position in the public opinion. Its makers must therefore produce a flawless argument for it before the public at large may be expected to give serious thought to the innovation, and this they are attempting to do in very excellent style in their illustrated catalogue in which the construction and its object are well described in general and in detail.

The principal claim advanced is, of course, that the use of pneumatic hub wheels obviates all the inconveniences resulting from punctures or other injuries of pneumatic tires, but this would be worthless unless the device at the same time offered the rider all the comfort in riding that is derived from pneumatic tires. The company contends that the pneumatic hub wheel is superior also in this respect and will endure much more wear and tear.

**Description of Tire and Hub.**

The general remarks on the requirements of spring devices in this article may enable readers of Cycle Age to form

FIG. 2. SECTION OF HUB.

their opinion in regard to the speed qualities and comfort-giving properties that may be expected of pneumatic hub wheels under all conditions of road surface and style of riding, with some degree of accuracy without actual trial of the wheels, but ultimately the tests of road and race track must, of course, determine their fitness for the average bicycle rider.

The tires used on the Collins wheels are of the hollow rubber cushion variety, forming, in cross section, a complete circle in conjunction with the rim, the meeting edges being flush. Fig. 1 shows the style and also the general outlines of the complete wheel.

The hub construction is approximately shown in Fig. 2, and is described by the company as follows:

"An inner hub, turned from the best bar steel, is mounted on ball bearings. Surrounding this hub are steel-lined aluminum cones, termed the thimble. This thimble carries the pneumatic hub tube, which in general appearance resembles a miniature air tire. An aluminum ring, known as the drum, surrounds the tube, and attached to the drum are the spokes. To prevent the introduction of grit and road dust, and to properly strengthen and stiffen the wheel as a whole, there are side plates stamped from high-grade and finely-finished nickel steel. On the rear wheels these side

plates are also used to transmit the driving power."

**Where Friction is Needed.**

For this purpose four circular depressions or cups are pressed in the side-plates and into each of these cups extends a short cylindrical lug coated with indurated fiber. These four lugs are secured to the drum portion of the mechanism and have a motion limited by the circumference of the cups. When riding is hard, as when climbing grades, the lugs will naturally be against the edges of the cup and will bear the strain of propulsion, but during ordinary riding they will play in any direction within the cups according to circumstances. Their friction against the bottoms of the cups, which is considerable, will not increase the labor of propelling the machine when the movement of the lugs is vertical—in response to a jolt—and when it is horizontal it only lasts for a moment.

**OPENING DAY IN DETROIT**

**Dealers Surprised By Sales Made—Spectacular Features Absent—Interest in Chainless.**

The Detroit cycle board of trade opened the season of '99 with a general opening of the several stores of the members last Wednesday. The weather was propitious and the season opened under conditions that were as favorable as could have been desired. Sightseers began flocking to the stores early in the day. In the afternoon the stores were thronged and many of the visitors made purchases on the spot. Few if any of the dealers had expected to make many sales during the opening, so the number of sales was a gratifying surprise.

The stores of the board of trade members were attractively decorated with flags and palms and pictures, and many of them had orchestras. The enthusiasm spread to dealers outside of the board and they got in line and threw their doors wide open during the remaining three days of the week.

Freaks and curiosities were scarce, the object of the dealers being to centralize the attention of their visitors in the quality of material and workmanship and finish of their bicycles rather than in unusual constructional features. Some demand is still expected for the bicycles that have been thrown from the top of a fourteen-story building without the bending of a tube, that have been ridden by champions of the track, or that have passed unscathed through a hail of Mauser bullets, and for tires that have been ridden for a year without a single puncture by the boy who delivers goods at tack and glass factories. Souvenirs were also conspicuous by their absence and few of the dealers were giving away anything except catalogues and information.

Inquiries largely centered in the chainless machines because, while riders are familiar with the standard chain type of machine, the chainless is the newest form of construction which has given satisfactory proof of speed and durability. Knowledge of the inner workings of its driving and transmitting mechanism was eagerly sought last week at the Detroit stores. The great deduction in price of the chainless bicycles appears to have been the move most needed to interest the public.

**No General Opening in Toledo.**

Toledo, March 6.—The bicycle dealers of this city are divided on the subject of holding a general opening, some of them believing that all would be losers thereby. It is contended by the few dealers who were in favor of holding a joint opening that the whole trade would be benefited, since the daily papers would

be interested and would inform the public of the affair. While it is conceded that the newspapers would give much free advertising, the manufacturers could not be interested in the project. Accordingly, announcements are made of individual openings.

**Marked Success of Washington Show.**

Washington, March 6.—The cycle show which closed Saturday night after running a week was the most successful affair of the kind ever held in Washington, and it will undoubtedly have a very beneficial effect upon the local trade. This is evident from the interest displayed and from the number of sales already made, many of which can be traced directly to the show. The attendance throughout the week exceeded the most sanguine expectations of the management. A down-pour of rain marked the closing night, but this seemed to have no effect upon the attendance, which was the largest of the week. The show was promoted by the Bicycle Show Co., an organization of leading bicycle dealers, and was such an unqualified success that the company will continue in existence for the purpose of giving a local show annually.

**Equalizing Chain Adjustment.**

H. W. Lloyd of Williamsport, Pa., is the inventor and patentee of the chain adjustment illustrated herewith which aims at the oft-attempted object of permitting uniform adjustment of both ends of the rear wheel axle. The axle is slot-

ted longitudinally along what becomes, when the parts are assembled, the upper side and is flattened on two sides at each end to allow turning of the axle with a wrench or spanner. An elongated washer is slipped over each end of the axle, engaging the slot in the axle by means of a small lug projecting into its central opening. The lower end of the washer is slotted radially toward the central opening and a pin projecting from the outer face of the lower jaw of the rear fork end fitting engages this slot. When it is desired to adjust the chain the axle nuts are loosened and one, at least, removed to allow placing a wrench upon the end of the axle. By turning the axle the elongated washer is compelled to turn with it and being stopped from pure rotation by the pin engaging the slot in its under portion it must incline one way or the other according to the direction of rotation given the axle, and thus carry the axle and consequently the rear wheel and sprocket either one way or the other along the slot in the rear fork end of the frame.

**Novel Method of Dunning.**

An original method of drawing the attention of delinquent debtors to overdue accounts has been hit upon by an Ohio retailer. To such as are slow in making payments he encloses the statement of account in a registered letter. The debtor in course of time receives a notice from the postmaster that a registered letter is waiting for him, and as such letters are

rare in his experience he hastens to the postoffice expecting to get a remittance from somebody who may happen to owe him money. His surprise upon finding that he is the victim of a conspiracy usually leads to a settlement of the account. This method offends some, it is true, but the dealer who practices it finds that the man who is offended is usually one whose patronage he can well afford to lose.

**AMERICAN AND ENGLISH EXPORTS**

**Shipments from New York Exceed Those from England By More Than Two-Thirds.**

The exports of bicycles and materials from the port of New York for the week ending February 28 are recorded as follows:

	Bicycles.	Mat'l.
Germany .. .	\$28,382	\$3,254
France .. .	18,357	9,845
Argentina .. .	11,574	1,860
New Zealand .. .	7,965	2,985
Holland .. .	6,628	464
England .. .	2,962	4,120
Russia .. .	4,031	75
Africa .. .	2,039	355
Denmark .. .	1,600	6
Italy .. .	1,143	221
British West Indies .. .	9494	335
Sweden .. .	1,171	25
Belgium .. .	200	736
British West Indies .. .	9,494	335
Switzerland .. .	.....	423
Portugal .. .	348	40
Cuba .. .	244	86
Dutch Guiana .. .	275	.....
Uruguay .. .	225	.....
Central America .. .	102	100
Porto Rico .. .	193	22
Scotland .. .	70	55
Prussia .. .	25	.....
Totals .. .	\$88,898	\$25,007

The total exports of cycles and materials from England for the week ending February 17 are recorded as follows:

Adelaide .. .	\$ 2,430
Alexandria .. .	35
Amsterdam .. .	1,000
Bombay .. .	2,230
Boulogne .. .	1,590
Buenos Ayres .. .	1,365
Calcutta .. .	2,305
Cape Town .. .	1,740
Christchurch .. .	1,515
Colombo, Ceylon .. .	545
Durban, South Africa .. .	3,145
East London, South Africa .. .	250
Freemantle, Australia .. .	100
Galatz, Roumania .. .	60
Ghent .. .	2,040
Gibraltar .. .	150
Hobart, Tasmania .. .	60
Hong Kong .. .	235
Launceston, Tasmania .. .	135
Lisbon .. .	1,250
Lyttleton .. .	175
Mackay .. .	65
Madras .. .	100
Malta .. .	185
Melbourne .. .	8,105
Nelson, New Zealand .. .	590
New York .. .	30
Port Elizabeth, South Africa .. .	340
Shanghai .. .	275
Singapore .. .	160
Sydney .. .	2,465
Trinidad .. .	75
Varma .. .	30
Wellington .. .	2,010
Total .. .	\$36,785

**Original Advertising.**

Original advertising by cycle dealers is cropping to the surface this year in many parts of the country. The value of such work is problematical. A Providence, R. I., specimen of it is herewith presented:

This — "ad" — was — written — while riding — a — Tribune — bicycle. The Tribune — travels — so — fast — that there — was — a — space — of — nearly — 42 — feet covered — from the — time — the — pencil — left — one — word — and — commenced — the — next. FRASER BROS. Co., 297-299 Weybosset street.

The factories of Coventry, England, shipped 35,300 bicycles last year, as against 41,300 in 1897 and 42,700 in 1896.

The automobile industry in France is paying nearly \$15,000,000 annually in salaries.

**CAB SERVICE STILL DOUBTFUL**

**PARISIANS ARE DISAPPOINTED**

**Electric Vehicle Company Cannot Secure Practical Light Accumulators—The Re-charging Problem.**

Paris, Feb. 15.—Much disappointment is felt in Paris over the fact that the electric cabs, so long promised and finally definitely announced to be ready for public service on the first of the present year, have not yet materialized. A very few of them have been seen about the streets from time to time, but they have not distinguished themselves, and have been speedily suppressed. The time when they will begin their work in earnest is now harder than ever to prophesy. The several companies which have undertaken the enterprise have all met with the same difficulties and disappointment. There have been impediments in the way of manufacturing just the kind of cabs best suited to the Paris streets; the training of the "coachers," and even their recruitment in sufficient numbers have not been such easy matters as they at first appeared, and the accumulators can not yet be made at once light and practical.

**Inconvenience of Re-charging Batteries.**

Locomotion is possible, but not under the conditions that would warrant the companies taking the risk of putting their vehicles on the streets. The most important problem which remains unsolved is how to recharge the batteries conveniently. With only a few cabs in service this would not be a perplexing matter, since the electric plants in various parts of the city would suffice, but when there are several hundred or a thousand of the cabs in use the difficulty will be considerably increased. It has been suggested that a number of "postes de secours," where the carriages may replenish their charges of electricity, might be built at short intervals along the boulevards; but loss of time and the inconvenience to the public make this ingenious plan impractical.

In short, the electric companies are confronted with a very knotty problem, and the inventor or engineer who will help them out has fame and fortune ahead.

**Automobile Fire Engines.**

The success of the recent experiments with automobile fire engines has induced the Paris municipal council to consider the question of introducing automobile machines for watering and sweeping the streets. They would do the work much more quickly than it can be done under the present system and a much smaller staff would be necessary.

**COMBINATION HEADLIGHT**

**Incandescent Electric Lamp Having Attached Oil Burner for Use When Batteries Fail.**

With a multiplicity of objects rarely found in so simple a thing as a lamp one John Washington Eisenhuth of New York city invents, and is allowed a patent on, a cycle lantern which is built into and becomes a part of the bicycle, which illuminates the pathway of the rider either by an oil or an incandescent electric light or both, which obtains its electrical power from batteries carried inside the handle bars and which is fitted with an improved hood shaped reflector placed in front of and above the lens. The bottom part of the lamp is in the form of a hollow body which also serves as handle bar stem and fits into the head of the bicycle. How it is fitted is not a part of the invention which the patentee finds it needful to explain;

neither does the patent drawing herewith reproduced—in which the fork stem is simply omitted—give any clue to the nature of the proposed arrangement.

The hollow cylinder has at its upper end a cup shaped mouth which receives by a snap catch the combustion chamber of the lamp and carries the handle bars on its rear side, these latter being attached by means of a split cross sleeve. The oil for the oil burner of the lamp is carried in the hollow body and the incandescent globe is hung from the top piece of the lamp body which also carries at its bottom the oil wick holder. Any simple form of electric battery, according to the inventor, may be carried in the handle bar tube, a cell of the battery being in each side of the bar. Interior wires from the poles of the battery lead to the incandescent globe. The assumption is that when the electric light proves to be the one that failed the rider can borrow a match and light up the oil burner, or the two lights may be burned interchangeably to suit.

Whether the electric light bulb is to be removed when the oil lamp is to be used, deponent sayeth not.

The patent gives the impression of being one of those in which the patentee reveals only a part of the idea which it is his intention to carry out—a precaution against imitators which frequently makes a patent appear absurd at first glance.

**Chain Infringement Suit Withdrawn.**

The suit of the Ewart Mfg. Co., or as it is perhaps better known, the Link Belt Machinery Co., of Chicago, against the Baldwin Cycle Chain Co., of Worcester, Mass., for \$20,000 damages on a purported infringement of a chain patent is settled, the suit having been withdrawn at the request of the prosecution.

**Chainless Models in Canada.**

Even in Canada the trade is giving serious attention to chainless machines. The Welland-Vale Mfg. Co., of Toronto, is the first among the Dominion makers to openly advocate the use of such machines.

Daimler, of Cannstadt, has built a motor carriage which can travel forty-seven miles an hour on the road and mount gradients of 11 in 100 at nineteen miles per hour. It is of sixteen horse power.

The Automobile Club of France has now 1,650 members.

DES MOINES, IOWA, Feb. 9, 1899.  
 NATIONAL CYCLE MANUFACTURING CO.,  
 Bay City, Mich.

Dear Sirs:

Will you please send me the price of a pair of No. 5 or 6 adjustable handle bars for my 1897 National?

The little racer Van had with him on the 29th is a beauty.

1899 makes my sixth year on a National and I will ride it 6 years more. Mr. \_\_\_\_\_ wants me to ride a \_\_\_\_\_ but I told him I had ordered a National.

A National rider never changes his mount. Please let me know as soon as possible about the handle bars.

Yours truly,  
 HARRY BURGER.

# Waverley

The Finest Bicycle Ever Built

## \$40

We mean just what we say—The Waverley for 1899 is the handsomest, strongest and most perfectly finished bicycle we have yet constructed, and if that doesn't mean the finest bicycle yet built then the testimony of Waverley agents and riders goes for naught.

We are making the best sort of everyday bicycles, too—Ivanhoe Specials at \$35.00 and Ivanhoes at \$25.00 and \$26.00—but in a separate part of the factories. Can't make two grades with the same workmen.

The combined line promises rich profits to wide-awake dealers where Waverleys are not already properly represented.

## ELECTRIC MOTOR CARRIAGES

We are rapidly arranging representation for our new Electric Carriages, which are thoroughly tested and perfected machines, stylish and elegant in appearance, free from trouble and annoyance and sold at reasonable prices.

INDIANA BICYCLE CO.  
 INDIANAPOLIS, IND.

# GASOLINE MOTORS

THE ONLY RELIABLE MOTOR FOR HORSELESS VEHICLES.

OURS can be run at cost of less than 1-2 cent per hour (2 horse power—larger ones same ratio). SPECIAL MOTORS and TRANSMISSION GEARS for Carriagemen and others to construct THEIR OWN VEHICLES.

WE believe this to be the very best Gasoline Motor ever placed on the market for simplicity, durability, more power and less weight than anything ever produced. Especially adapted for Motor Wagons, Boats, Small Electrical Plants, Elevators, Machine Shops, Optical Works, Printing Presses, Feed Cutters, Carpenter Shops, Lathes, Emery Wheels, Corn Shellers, Laundry Machines, Pumping Water, Ice Cream Freezers, Irrigation Machinery, Ventilating Fans, Hay Presses, Cream Separator, Sewing Machines, Mining Machinery, Sawing Wood, etc., etc.

These Motors are manufactured horizontal or upright. They are absolutely safe, and cannot explode or cause damage, and are always ready for instant service. They require no mechanical experience or licensed engineer.

Our 2-horse-power Motor weighs but 89 pounds, and occupies a space 24x11 inches; runs at high speed and high compression.

Working parts are all tightly enclosed; one sight feed oil cup lubricates all bearings. Our ignition device is perfect, and all wearing parts are especially strong and substantial.

# THE PASTIME AND SPORT

## GERLACH GIVEN CHAIRMANSHIP

How Selection Was Made—Must Spend Much Time in the East—Other Racing Board Members.

Philadelphia, March 6.—The make-up of the L. A. W. racing board must have given President Keenan many a bad half hour during the past fortnight, judging from the delay in the announcement of its personnel. However, the greater portion of this task, the selection of a chairman, has been performed without antagonizing any particular section. Fred Gerlach, who was tendered the position last week, is popular with the racing element in the east, his recent efforts in behalf of the admission of professionals to membership in the League having in nowise tended to lessen his popularity.

### How it Came About.

The chain of circumstances which led up to Gerlach's selection were as follows: Keenan had a strong leaning toward Mott when his own election first became practically assured; but it needed only a few minutes' work on the part of some of the local League lights to convince the Pittsburger that Uncle Jerry wasn't in the running. The next possibility to loom up on the horizon was Mears, of Cleveland. When the Assembly met in Providence the Ohioan's chances were of the best, but the Pennsylvanians had an idea that they could induce Gideon, in view of the crisis in League racing affairs, to once more assume his old place at the head of the board. Keenan was convinced that if "Old Eagle Eye" could be induced to re-enter the field the most difficult portion of a difficult problem would be solved. Mears was therefore dropped for awhile, and, as the result shows, was never again seriously considered.

### Offers Place to Gideon.

Keenan came to Philadelphia last Monday and after a long consultation with Gideon became satisfied that "Old Eagle Eye's" business interests would not allow him to accept the post and the candidacy of Gerlach was so eloquently urged by Gideon that within an hour a long telegram was dispatched to Chicago tendering the place to Gerlach, the only string to the offer being a request that the Chicagoan spend the early part of the racing season in the East, in order to be near the scene of the coming conflict with the outlaws.

Gerlach replied the following day accepting conditionally, with the intimation that his law practice in Chicago needed his attention at intervals and that he would be compelled to be in that city for a number of weeks during the next six months. No objection being made to this, the deal was consummated. Gerlach will establish headquarters in Philadelphia, where he will have the invaluable assistance of Gideon in mastering the details of the office.

### Territory Assigned to Appointees.

Philadelphia, March 7.—President Keenan today definitely announced the following racing board appointments: Fred Gerlach, of Chicago, chairman, in charge of the district embracing Illinois, Missouri, Iowa, Minnesota, Wisconsin, Michigan, Indiana, Ohio; Arthur W. Robinson, of Boston, assigned to the charge of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecti-

cut; C. A. Dimon, of Philadelphia, to have control of Pennsylvania, New Jersey, Delaware, District of Columbia, Maryland, West Virginia, North Carolina and South Carolina; J. W. Brigman, of Louisville, assigned Kentucky, Tennessee, Arkansas, Louisiana, Mississippi, Alabama, Georgia and Florida; W. I. Doty, of Denver, in charge of Colorado, Kansas, Indian Territory, Oklahoma, Texas, New Mexico, Arizona, California, Nevada, Oregon, Washington, Idaho, Montana, Wyoming, North and South Dakota and Nebraska.

## CHICAGO SEASON OPENED

Annual Run to Michigan City Brings Out Some Hardy Has-Beens—A Hard Ride.

The ninth annual club run of the Chicago C. C. to Michigan City, which formally opens the riding season in the Windy city, was made last Sunday by the baker's dozen of hardy road riders who were the only ones in town who sufficiently spurned the epithet of "butterfly" to make the notoriously hard trip over the fifty odd miles of Michigan Central railroad boulevard, with dismounts at every wagon road and switch for cattle guards and frogs. It was an admirable day so far as wind and weather were concerned, but the warmth thawed the frost out of the cinders and gravel and left the path mushy. The party that left the city was composed of Arthur Gardiner, James Levy, Orlando Adams, C. G. Sinsabaugh, Fred Nelson, and two members of the Cycle Age editorial staff. Frank Hovey and a stranger were picked up a few miles from the start and at Kensington J. P. Bliss, Arthur Lumsden and C. P. Root, who had made an earlier start, were overhauled. Lumsden quit at Hammond where a stop was made at Dave Shafer's hotel for a light meal. The Age representatives stopped before reaching Pullman to re-cement a loose tire and mend a slow leak and lost the bunch. Six miles out from Hammond there was a general spill and Nelson's front wheel went to pieces. He walked back to Hammond, secured another wheel and pushed on after the others, whom he failed to catch.

The first bunch to arrive at the destination included Bliss, Root, Hovey and Sinsabaugh, all pumped out from pushing through the soft going. Gardiner, who rode a racing machine geared to 112, and Levy finished three-quarters of an hour later, "Chicago's Pride" asserting it was the hardest ride of his life. Then Nelson rode into the Indiana town and two hours later the Age men finished after a disagreeable series of tire troubles.

### Motocyclist Breaks Elkes' Record.

The motorcycle hour record was successively broken in France on February 16 and 18. On the first of these days Marcellin rode 55 kilometers 50 meters (34 miles 860 yards) with flying start, breaking the record of 32 miles 131 yards made by Vigneaux February 11. Two days later Vigneaux again went after the record and covered 58 kilometers 623 meters with standing start, thus adding 1 mile 859 yards to the record made by Marcellin with flying start and nearly 1¾ miles to Harry Elkes' hour record. Vigneaux therefore holds the record at practically 36 miles.

## "PLUGGER BILL" IN AFRICA

Martin Writes of Cycling in the Dark Continent—His Defeat of Champion Van Heerden.

This is a great bicycle place, writes "Plugger Bill" Martin from Cape Town, South Africa, where he has been racing the past winter. I am told there are more riders in proportion to the number of people than in any other town in South Africa. They go in for American machines, with bright colors. The streets are broad, and the buildings fairly respectable. Outside, the roads are level and well made. Touring is all the go. There are lots of negros, and they are terrors to follow you about. I have several times taken long rides into the country for training, and I can't go out on my machine without a dozen or so young bucks, who run like deer, following, whooping and yelling, "Martin comes! Martin comes!" I can tell you it's a bit riling, and I often feel inclined to belt them. When I get out of town I usually put down my head and shake them off, but it is not for long, as they track my wheel marks, and when I stop to take pictures they catch up and amuse themselves by feeling the tires and spinning the pedals. One fellow seems never to get tired; he has several times chased me for fifteen or sixteen miles, and then waited for my return to chase me home again.

### Wants to go to Brazil.

South America is not half a bad territory, and I have so far spent money, and had a good time at Cape Town and Johannesburg. I had intended to proceed at once to Brazil, where I am told things are pretty slick in cycle racing, especially round and about Rio Janeiro where they have recently opened a splendid speed path. I would like to have Walne or Jackson of Australia go over with me. We could do well in Brazil, I feel certain.

### Forces Match With the Champion.

At Cape Town I "nosed" about for a try at promoting a race meeting, but it seemed to fall flat for a while, as the people here are sticklers for excitement, and cycle events don't seem to fill the bill. However, I succeeded in getting a match on with the South African champion, Van Heerden, who, until I came, was considered by the folks here as a human express engine whom nobody dare tackle. The date was late in December and the contest took place at Green Point. The idea of a match caught on, as the local sports opined that dollars were to be got out of it by backing their man. The distances were one, five and ten miles, which, as you know, just suit me. Alas, the books here are not very strong. I and my friends pretty well cornered the market.

### Like Giant and Dwarf.

This, you must know, is an amateur loving city, and the papers do not puff professional races. So the meeting got up on the day of the match was called a "semi-professional carnival," rather a hair-splitting device. The attendance was good, however, and there was much yahooping for the popular favorite. When we appeared on the track for the first "go" I couldn't help laughing as we rode round. Van Heerden is 6 feet 4 inches, and sits almost bolt upright on his bi-

“History repeats itself and is ever old”

cycle, while I, as you know, get down to my work. I looked like a "kid" beside the giant.

#### Wins All Three Races.

The mile race was "dead easy." In the last lap Heerden, who has no head for tactics, led all the way until at the bend into the winning straight, when he ran wide. I just hit her up and ran in with three lengths to give away. The time was 2:22.

The five-mile event was a pursuit race. Van Heerden was slow off the mark, and I gained on him during the first two miles. Two miles from home I let out for a few laps, and kept up the pace until I got near enough to make things safe, when I eased and played follow my leader about a dozen yards behind. Van Heerden, I must say, put in real good work, and the gait was very fast. At the bell I jumped out and moved up alongside him, and waited for the last turn, when I sprinted and won by fifteen yards. This secured me the match. The time was 11:09 1-5 for the full distance, which is world's record for pursuit racing.

The ten-mile was a scratch contest. We paced each other until the bell at a fair pace. I followed Van Heerden until the far turn for home, when I ran up the bank and tried to run down so as to jump him, but just as I did so he jumped, and as I came to the pole I cut it rather fine and his front wheel, so they say, touched my hind one. I won easily, but was disqualified for the event on protest. I knew I was in the wrong, although it was unintentional, and apologized to Heerden, although it didn't make any difference to the result of the match. The time was 27:26 1-5.

#### N. C. A. to Incorporate.

The National Cycling Association has issued its first bulletin. It hails from the offices of the board of control at 150 Nassau street, New York city, and states that the association will file papers of incorporation with the secretary of state of New Jersey this week. Under the incorporation provisions members will be liable for only the amount of their membership fees.

Professional riders and their trainers and amateurs can now apply for registration to the board of control for the season of '99, the fees being \$2 each for professionals and trainers and \$1 for amateur racing men.

Applications for places in the N. C. A. "grand circuit" can be filed with the chairman of the board of control. This circuit will start in the West, July 8, and end in the East early in September. A series of races on this circuit will decide the championship of the year. A New York state circuit will be arranged for the month of June.

#### Courting Modest Kansas City.

Kansas City is overwhelmed with the attentions of race meet promoters just now. Brady has applied to the managers of Convention hall asking for the use of that building for the purpose of running a six-day race to be contested by his aggregation now on the coast; Jack Prince offers to bring the men under his charge now in Texas and give a meet, while the manager of the female aggregation would like to give a long race between the women riders.

#### New York A. C. C. Opposes Tax Bill.

The bill which has been introduced in the New York legislature to tax bicycles and apply the funds to the construction and shading of bicycle paths is being opposed by the Associated Cycling Clubs of New York city, on the ground that it will be an entering wedge for the enactment

of a general tax on bicycles; that it will hinder and delay the cause of good roads and in some sections smother the good roads agitation entirely; that it will give rise to much dissatisfaction and discontent among wheelmen, who in order to use side paths will have to take out licenses in all counties where there are such paths; that it will increase dangers of collision between cyclists and pedestrians, since both may use the paths, and that it will give special privileges that will create opposition from residents adjoining the paths.

#### SURPRISE PARTY BY LAWSON

"Terrible Swede" Wins 100-Mile Open—Fournier and His Motorcycle Pace Stevens to Victory.

San Jose, March 6.—A 100-mile open track race was run Sunday under the auspices of the Garden City Wheelmen and was won by John Lawson. The event was unpaced, and special lap prizes drew the field into a sprint for lap after lap. Charles Wells, who entered at the last moment and without training, gained the special prize for leading at the laps. He fought for and gained 87, while Barnaby had but 70. Fredericks, Ashinger, Iver Lawson and Clem Turville, of the field of fifteen that started, quit. Lawson, the last man expected to win, shot out of the bunch in the stretch, and in a hard fight with John Chapman, Teddy Goodman, Earl Stevens, Charles Turville, Charles Wells, Oscar Julius, Tom Barnaby, and Nawn, won the contest, the finish being in the order named, and the riders being closely bunched at the tape.

Last Saturday Henri Fournier rode a mile on his petroleum tandem, with Tom Barnaby steering, in 1:35. The machine was so constructed that the riders could assist the motor by pedaling. Fournier believes he can reduce his time to 1:30.

At the same meet Orlando Stevens defeated Harry Gibson in a ten-mile match by one and three-quarter laps on the third-mile track. Stevens was paced by Fournier with his "infernal machine," while Gibson had two triplets and three tandems.

#### Chicago Organizations Unite.

The Associated Cycling Clubs of Chicago met Monday night and voted to amalgamate with the Cook County Cyclists' Association and the Northwest Cyclists' Association and to hold the Decoration Day road race as usual. By the union of the three organizations twenty-six new cycling clubs are added to the roster of the A. C. C.

#### NEWS IN BRIEF.

C. W. Miller has canceled his coast engagements and returned to Chicago.

Wridgway, the former English stayer, has entered the motor vehicle business in Manchester.

Detroit road riders have almost entirely abandoned century riding and the enthusiastic centurion is a person hard to find in that city.

Floyd McFarland has decided to begin training for middle distance racing the coming season.

Statistics show that in England 100 cyclists and 200 drivers of horses are fined weekly for exceeding the speed limit and violating the lamp laws.

C. W. Parkins, of the Century Wheelmen of New York city, won first prize in the club competition mileage by riding 28,883 miles during 1898. During the year he made 105 centuries.

The Intercollegiate Bicycling Association, which was organized recently for the purpose of giving an impetus to cycle racing among college men, and which came into existence as a result of the movement of the Intercollegiate A. A. U. to curtail bicycle events, has decided to hold an annual championship event. The competitors for

this championship must abide by the regulations of the I. A. A. U. regarding the eligibility of college students for any of the intercollegiate championships.

Cycling enthusiasts in St. Louis are endeavoring to revive the annual Forest Park road race, which has been run for several years up to '98, when it was dropped through lack of encouragement from parties solicited for the donation of prizes.

The recent six-day race in San Francisco was a losing proposition for the promoters, for while large crowds were attracted to the pavillion during the last few days of the week, the attendance during the first three days was so light that the loss sustained then could not be made up.

Arrangements are being made for a series of match races between the three Butler boys and Gougoltz, Lamberjack and Eden, to include contests on singles, tandems and triplets. The Waltham track will probably be the scene of the performances, but the dates have not as yet been decided.

Cape Girardeau, Mo., is said to have been selected by several of the racing men as their training ground this spring. The accommodations there seem to be more to the liking of the riders than those at the Fountain Ferry track, where much of the early spring training in past years has been done.

According to all reports, extensive improvements are contemplated at the Waltham track. It is the intention to increase the banking two and one-half feet. The first event of the season at the track will be on April 19, when Harry Elkes will appear, but his opponent has not been announced.

The following prizes are offered in the 100-hour race to be run in Roubaix, France, May 7 to 11 next: First prize, \$600, and \$100 extra if the San Francisco 100-hour record is broken; second, \$300, and \$40 if the San Francisco record is broken; third, \$300, and \$20 if inside former record; fourth, \$160; fifth, \$120; sixth, \$80.

Plans are afoot for the construction of a ten-lap inclosed track in Tacoma, Wash., near the center of the city, with the object of securing the presence of the eastern racing men who have been making matters lively on the Pacific slope this winter. The promoters are prominent cycle dealers and riders, who are enthusiastic over the scheme.

The May carnival to be held in Birmingham, Ala., will doubtless be given a livelier interest than usual by the introduction of bicycle racing. The Birmingham Cycle Racing Association is taking steps toward promoting a week's race meet to be held at the new Coliseum track during the festivities and an endeavor will be made to attract the best talent in the country.

Club spirit is at such a low ebb among the members of the St. Louis Cycling Club that the club house of the organization has been abandoned and from now on the existence of the oldest and what was at one time the most prominent cycling club in St. Louis will be merely a matter of sentiment, some of the members not having the heart to disband entirely.

Tourists with bicycles traveling in Germany will be much inconvenienced by a law recently enacted which compels all bicycles to be carried on slow trains. No machines will be allowed on the passenger express trains, and owners of bicycles will often be compelled to wait at their destination a half a day or an entire night for the arrival of their machines before they can proceed further.

The respective directors of the Chicago Cycling Club and the South Side Cycling Club of Chicago held a joint meeting last Saturday and brought about the consolidation of the two clubs. The South Side Club will abandon its club house and move over to the Michigan avenue home of the Chicagos. The combined strength of the two clubs aggregates about 400 members, making the new body one of the strongest in Chicago.

When Tom Cooper began racing he had been a drug clerk at a salary of about \$5 a week. Money commenced to come his way when he won, and he knew enough to save it. He had friends in his home city who put him next to some good things and now Tom has \$22,000 in Detroit telephone stock, which nets him \$1,600 annually. Some time last fall five wealthy Detroit men started a lime company, each putting in \$50,000. One of them was a friend of Cooper's and he offered to let Tom put up \$10,000. The racing man did not have that much ready money, but produced \$7,000, his friend giving him plenty of time to pay the balance. One month after the company was organized Tom was offered \$20,000 for his interest, but he refused, and is now thankful, as the stock has since grown still more valuable. In all it is calculated that Cooper is worth nearly \$40,000, not bad for four years of racing.

## SUBJECTS OF GENERAL INTEREST

SEASONING  
WOOD BY  
ELECTRICITY

A model plant for seasoning wood by means of electricity is now in operation in London. The timber to be seasoned is placed in a large tank and immersed, all but an inch or two, in a solution containing 10 per cent of borax, 5 of resin, and  $\frac{3}{4}$  of carbonate of soda. The lead plate upon which it rests is connected to the positive pole of a dynamo, and the negative pole being attached to a similar plate arranged on its upper surface so as to give good electrical contact, the circuit is completed through the wood. Under the influence of the current the sap appears to rise to the surface of the bath, while the borax and resin solution takes its place in the pores of the wood. This part of the process requires from five to eight hours for its completion, and then the wood is removed and dried either by artificial or natural means. In the latter case a fortnight's exposure in summer weather is said to render it as well seasoned as storage in the usual way for five years.

The current employed has a potential of 110 volts, the consumption of energy being about 1 kilowatt per hour for each cubic meter of timber, and the greener the wood the better, because its electrical resistance is less. The liquid in the bath is kept at a temperature of from 90 to 100 degrees F.

Those who are introducing the process into this country from France do not profess to be able to give a complete explanation of it, though they describe it generally as a case of electro-capillary attraction, but they claim that its results are satisfactory, however surprising they may seem. They even state that some woods, such as the "maritime pine" of the south coast of France, which cannot now be properly dried, will, after their treatment, be found useful and serviceable for practical purposes.

ARTIFICIAL  
SILK  
MANUFACTURE

An artificial silk is manufactured from gelatin. A reservoir containing gelatin is kept heated at a certain temperature, to keep the gelatin in liquid form continuously. The top of the reservoir contains numberless small openings through which the gelatin oozes in very fine streams. An endless chain of a strip of linen cloth running over pulleys receives this liquid; and before the chain has traveled far, it is dry and presents a fine thread of uniform thickness and brilliant surface, ready to be wound upon spools.

The whole apparatus requires little attention; the only thing to be looked after is to change the fully wound spools for empty ones. A single workman can oversee ten apparatuses as described, which will produce about 470,000 yards of threads per day—equal to a silk production of 24,000 cocoons. To make the gelatin threads proof against being dissolved in warm water, they are lightly wound on drums and submitted to the fumes of formaldehyde in a closed room for several hours. The result is not only their power of resistance to water, but also to any other solution.

The coloring, if wanted, is added to the liquid gelatin at the beginning. It absorbs dye readily and the brilliancy of the thread is not affected. The proportion of dyestuff is stated to be 15 ounces in 330 pounds of liquid gelatin, if a bright color is wanted; but for the present fash-

ionable pale colors, the 15 ounces would do in 6,600 pounds of liquid. A drawback against the usefulness of the gelatin silk would be its low degree of firmness in the thread, but in a mixture with real silk or fine linen or cotton thread, a durable tissue could be produced. It is estimated that the gelatin silk could be produced at about \$1.15 per pound. Collodion silk costs at present from \$2.25 to \$2.85 per pound, while natural silk reaches \$6.25 per pound.

NEW PROCESS  
COLOR  
PHOTOGRAPH

Prof. Wood, of the University of Wisconsin, the originator of the electrical thaw has a new method of photographing in natural color. He reproduces the colors by diffraction, a method not hitherto tried, and though at present the production of the first finished picture is a somewhat tedious though not difficult process, when it is once made duplicates can be printed from it as easily as ordinary photographs are made.

The pictures are on glass and are not only colorless, but almost invisible when viewed in ordinary lights, but when placed in a viewing apparatus, consisting of a convex lens on a light frame, show the colors of nature with great brilliancy.

The finished picture is simply a diffraction grating of variable spacing. In other words, it is a transparent film of gelatin with fine parallel and equidistant lines on it—about 2,000 to the inch on the average. The colors depend solely on the spacing between the lines and are pure spectrum colors, or mixtures of such, the necessity of colored screens, or pigments, used in all other processes except that of Lippman, having been overcome.

The pictures can be projected on a screen by employing a suitable lantern, or can be viewed individually with a very simple piece of apparatus consisting of a lens and perforated screen mounted on a frame. The present process can be greatly simplified, and it will be possible to expose a plate in the camera under three-color fillers on the surfaces of which diffraction gratings have been impressed by photography, and develop it at once into a colored photograph, which, strange to say, will be a positive when seen in the viewing apparatus, or projected.

A peculiarity of the process is that there is no such thing as a negative in it.

ENGLISH  
CYCLE FACTORY  
WORKERS

Though at first sight it would appear the English cycle trade had nothing in common with that phase of industrial life known as trade unionism, and is not, therefore, called upon to take more than a passing interest in the affairs of labor, the fact is that, as an important branch of the engineering industry, the affinity between the two may lead at some future time to the introduction of labor questions into its own province. At present the great body of cycle workers are not affiliated with trade unions, and it is the earnest wish of the trade that this Utopian condition of things may continue to reign. At the present time, however, the trade unionism of the country is assuming a somewhat aggressive attitude, and it is feared that a revival of enthusiasm for organization among the workmen of the country would result in the formation of a well-organized cycle workers' union, and perhaps the federation of such a union to some larger body.

WHAT IF  
THE BIG TRUSTS  
FAILED?

Considering the uncertainty that attends the stupendous experiment of consolidating three-fourths of our industries into "trust" organizations, it is not surprising that some people should be asking—what will happen in the event of the monopolies failing of their purpose and therefore becoming disintegrated and desiring to revert to the former individuality of their component parts? The following gives pointed expression to that contingency:

If one of the numerous trusts now forming should become bankrupt through mismanagement or overcapitalization or any other cause or the trust should be declared illegal by the courts and dissolved, what would become of the capital invested in the trust enterprise?

If a trust should become bankrupt the property of the constituent corporations would be absorbed in the payment of debts. The trust, whether it is itself a corporation, a mere committee or an unincorporated association, is an agent of the corporations and is authorized to bind them by contract, and these corporations cannot be heard to plead the illegality of the combination for the purpose of evading a loss which they have brought upon themselves, and throwing it upon their creditors. An action quo warranto to put an end to the existence of a trust may be brought either against the trust itself or against any one of the constituent corporations. If it is brought against the trust, and is successful, the combination will simply be dissolved and each of the integers will be compelled to take its property back under its own control and manage it through its own officers. If the proceeding is against one of the corporations forming the trust, and is successful, that corporation will be dissolved, its property will be sold, and the proceeds will be distributed among its creditors and stockholders. Such was the decision of the New York courts in the proceedings brought by the Attorney-General against a member of the trust known as the Sugar Refineries' Company. The courts held that by so doing it had forfeited its right to exist as a corporation.

It will thus be seen that there is little reason for the very grave apprehensions entertained by some that, in the event of the breakdown of the monopolist principle, from any of the dangers its application has yet to encounter, there must be a destructive catastrophe arising from the insolvency of these mammoth institutions. There appears to be no reason for contemplating the possibility of any such outcome. Should the original individual firms or corporations, included in a trust desire to revert to their former separate identity, there is nothing to legally prevent their doing so. There is nothing in the nature of a legal finality in the forms of organization adopted in these amalgamations; the whole system may, with comparative ease, return to the old regime of competition between disassociated producers when they have become convinced from experience that a permanent organization of monopoly is an impossibility. There is some considerable satisfaction in this view of the new industrial situation.

The Russian minister of the interior has submitted to the council of the empire a proposition to tax bicycles \$5.13 each, the funds to be used by the cities.

# INFORMATION FOR BUYERS

## SHEPARD BEVEL-GEAR CYCLOMETER.

A. G. Spalding & Bros. of New York city and Chicago are pushing energetically two sundries, one the Christy saddle and the other the Shepard bevel gear cyclometer. The manufacturers of the Shepard cyclometers claim that the same grade of workmanship enters into their construction as is employed in the manufacture of watches. The cyclometer is but 11-16 of an inch in diameter and without the bracket weighs but 1 1/4 ounces. Every part is made either from hardened brass or bronze and all exterior parts are nicked. No lubricant is required and no springs are used. The operating mechanism being on the bevel gear plan, there is a positive motion at each revolution of the bicycle wheel. With the detachable holder or bracket the cyclometer can be readily removed and carried in the

pocket, a convenience which will be easily appreciated by those riders who have experienced the breaking of cyclometers on bicycles transported in railway baggage cars. Besides the regular bevel gear style, the Shepard cyclometer is made in a small trip pattern which weighs only three-fourths of an ounce. This cyclometer registers to 100 miles and repeats. The register can be set back to nothing from any point by turning the outside knurled end plate to the left. All Shepard cyclometers are made to attach on the left side of the bicycle, the mounting and dismounting side.

## BIG PURCHASE BY NATIONAL CEMENT CO.

Toledo, O., March 6.—A deal has just been consummated that will prove somewhat startling in the trade and will perhaps not be especially relished by trade competitors. The National Cement & Rubber Mfg. Co., of this city, has just absorbed by purchase the Red Cross Cement & Rubber Co., of Rochester, N. Y.

This deal, which includes all names, trade marks, good will, patents, patterns, etc., has been pending ever since the big cycle show in New York, when it was first broached. The purchase price has not been made public, but is well up in the five figure column. It will be recalled that Arlington U. Betts & Co. first manufactured the Red Cross brand of goods in this city, and built up an enormous trade both in this country and on export lines. Betts sold out to F. W. France & Co., of Rochester, and afterwards the business was conducted under the name Red Cross Cement & Rubber Co. Upwards of \$50,000 have been spent in advertising that name, "Red Cross," in connection with these goods.

Only two years ago a company was organized here with E. P. Hubbell (who had for years been identified with the ranking national bank of the state), as one of the main factors in the new firm. With him were associated a number of aggressive business men of the city. Mr. Bancroft, who was the right hand man for the Betts people, was one of the head men in connection with the new firm; in fact, he was at once made its superintendent. The growth of this firm, which fixed upon the name "High Pressure" as its trade mark, has been most remarkable. It spread out in every direction, until it has agencies in every city and town of any consequence in this country, while it has numerous general agencies in South America, England, Germany, France, Australia and Canada. Its goods have been shipped during the past year to practically every civilized country on the face of the earth.

Mr. Hubbell, who became its general manager, soon found it necessary to resign his position with the bank and devote all his time to the National Cement & Rubber Co. Only two weeks ago it completed arrange-

ments for trebling its shipping and manufacturing capacity. Now it has absorbed the entire Red Cross business.

Hereafter, beginning with next week, all shipments of Red Cross goods will be made from the Toledo plant, and all mail and orders will be received by the National company.

It is not disparaging the merits nor the extent of business of any other concerns to say that by this purchase the Toledo company is now the largest and most completely equipped of its character in the world.

## SAGER GEARS AND SADDLES.

The Sager Gear Co., of Rochester, N. Y., is practically ready to start its plant for the manufacture of chainless gears and will be able to fill orders for these roller pin gears promptly after March 10. The demand for them has surprised the makers themselves and is growing rapidly.

In addition to its gear business, the Sager company states that it has more orders for its saddles than at any previous time in its history. It is making special efforts to push its Flexible saddles and the guarantee offered is evidence of the company's faith in the goods. These saddles are made in a peculiar manner, having no wood cantle or wood tree, no set screws, bolts or nuts, and being composed of fewer parts, it is claimed, than any saddle ever offered to the trade. The steel spring forms a supporting base and yields with every motion of the body, but at no time throws the rider violently from the seat. Only an exceptionally fine grade of leather is used. Flexible saddles are given as regular equipment or option upon the bicycles of such representative manufacturers as Pope Mfg. Co., E. C. Stearns & Co., Waltham Mfg. Co., Iver Johnson's Arms & Cycle Works, Davis Sewing Machine Co., R. H. Wolff & Co., Geo. N. Pierce & Co., Packer Cycle Co., Relay Mfg. Co., Light Cycle Co., Geneva Cycle Co., Speeder Cycle Co. and Bean Chamberlin Mfg. Co.

In addition to the Flexible saddles the Sager company is also making a complete line of other styles, the principal one being the hair padded type which is used exclusively by the Lozier Mfg. Co. The Sager Gear Co. claims to be more than holding its own in the saddle business and an inspection of the shipping room seems to bear out the assertion.

## BAGLEY TOE CLIPS SELL WELL.

A. G. Bagley & Co., 172 South Clinton street, Chicago, are enjoying constantly increasing sales on their various patterns of toe clips and other cycle sundries, among which are lamp brackets and coasters. Two popular patterns of toe clips manufactured by this firm are shown herewith. The clip at the left in the illustration is the new "Chicago" adjustable clip, which may, by loosening the countersunk bolt in the corrugated plate, be extended or reduced to suit the foot and the fancy of the rider. The

clip at the right is very rigid, the front loop being stiffened by forming the straps into curved sectional shape.

## BROAD PATENT ON PUNCTURE COMPOUND.

The Buffalo Specialty Mfg. Co. of Buffalo, which makes the Neverleak puncture healing fluid, has by purchase from the Indiana Rubber & Insulated Wire Co. of Marion, Ind., become sole owner of the patent granted to Charles E. Duryea, covering the use of liquid or semi-liquid compounds in tires for the purpose of curing leaks in the latter. The Duryea patent does not specify any particular kind of puncture healing mixture, but broadly covers the use of any such compound in pneumatic tires. The Buffalo Specialty Mfg. Co., in obtaining possession of these patent rights, purposes to vigorously defend itself against all infringers and to protect dealers selling Neverleak against unlicensed competition from infringers. While the patent covers the use of such compounds in combination with pneumatic tires and does not directly claim the manu-

facture of the compounds, the owners state that there are several court decisions which may be taken as precedents showing that persons making anti-leak compounds can be held as contributory infringers even though they do not put it into the tires themselves.

## CRUCIBLES FOR IMMERSION BRAZING.

The general introduction of immersion brazing has created a widespread demand for plumbago crucibles to be used in dip brazing furnaces, and since the experimenters with the process have been learning new points concerning its economical and systematic use this demand has broadened into one requiring crucibles of different sizes and shapes. The Bridgeport Crucible Co. of

Bridgeport, Conn., meets the varying demands for crucibles by placing in the market several stock patterns and offering to make to order other special designs at the request of patrons. The crucibles here shown are two of the popular stock patterns. The flanged crucible is small compared with the general run of crucibles now in use and is intended for use in brazing small parts and such frame joints as do not require much surface area in dipping. The flangeless crucible is somewhat of an innovation, most of the crucibles used in the past having had flanges. Where the flangeless crucible has been properly used in immersion brazing furnaces, however, it has proven a decided success, and some brazers are now using it entirely in preference to the flanged crucible. The Bridgeport Crucible Co. will mail upon request from interested parties full size blue prints giving complete dimensions, together with prices, of the various patterns it makes.

## IDE FACTORY AGAIN RUNNING.

The factory of the Ide Mfg. Co., of Peoria, Ill., is again in operation, the plant having been opened by a company mainly consisting of employees of the old Ide company, who will conduct the business on a co-operative plan. F. F. Ide has retired from the business and the future welfare of the company will be under the care of R. M. Roberts. Economy in manufacture will be the watchword of the new company and a systematic course of selection of manufacturing methods will be undertaken, the outcome of which will be that those parts and fittings which it is found can be purchased cheaper than they can be made in the Ide factory will be obtained directly from the parts manufacturers.

## UNITED STATES BICYCLES.

Frank Sturges, 227 South Green street, Chicago, has issued his catalogue of United States bicycles. The line shown comprises ten models. Models 0 and 1 sell at \$35 each, Models 2, 3, 4, 5, 6, and 7, which are three pairs of men's and women's machines, at \$40 each, and Models 8 and 9, which are the leaders, at \$50 each. One of the strongest claims of the manufacturer for these bicycles is that all of the metal parts with the exception of the chains are made in his own factory. Some of the distinctive features of United States bicycles are the outside fish-mouth reinforcements, the chain adjustments, the special two-part hanger group, the disk adjusting, direct tangent spoke hub and the felt lined dress guard for the ladies' machines.

## AMERICAN MACHINE CO.'S LINE.

Grasping the fact that the ability to meet the popular desire for color and boldness in illustrative work generally constitutes good

advertising, the American Machine Co. of Flint, Mich., has shown in its recently issued catalogue the various models of bicycles in its line in striking colored illustrations by the three-colored process. The recipient of the catalogue is thus given a graphic idea of the exact appearance of the machines. The company's leader is a 30-inch wheel model named the American Standard and listed at \$50. The American Special, at \$40 is made in both men's and women's patterns and is the firm's standard machine. The American Banner lists at \$25 and the American Diamond, built on the same general lines as the Banner but with flush joints, sells at \$35.

**ELECTRICALLY WELDED FITTINGS.**

The Standard Tool Co. of Cleveland, O., which is well known as being the sole firm in this country that does electric welding on bicycle parts and fittings, is sending out an advance runner for its complete catalogue in the form of a four-page folder illustrating two of its entirely flush electrically welded seat posts. These are furnished with stems ranging in size from 3/4 inch to 1-1/16 inch and each post is guaranteed to be of uniform diameter for the entire length of the stem. They are sold plain or nickel plated, and the highest possible finish is assured in either case. The stock angle on the latest patterns of these posts is 70 degrees, which, being standard angle, permits the use of the stock posts on almost any bicycle.

**BERKEY & GAY'S EXPANDER.**

The expander shown in the accompanying illustration is made by Berkey & Gay, of Grand Rapids, Mich., and has extremely simple action combined with a large and yet almost positive gripping face formed by the edges of the wedge piece. It does not require so much exertion of force to operate as the expanders which depend upon the enlargement or contraction of the

entire sleeve surrounding the seat post or handle bar stem. The wedge has only a vertical motion, causing the chamfered outer edges of the wedge to slide inwardly and downwardly upon the inner chamfered edges of the split sleeve. With the screw threading at the upper end of the sleeve and in the nut slightly oiled, this expander should operate very easily for either tightening or loosening, while also presenting a neatly finished appearance.

**HANNA CYCLE MATERIAL CO.'S LINE.**

A complete catalogue of bicycle sundries and fittings has been issued by the Hanna Cycle Material Co., 120 East Genesee street, Buffalo, successor to the Strauss-Hanna Cycle Material Co. The materials catalogued embrace the usual articles handled by firms catering to the trade of dealers, repairers and assemblers, as well as to that of manufacturers. The line of hubs shown is large and includes hubs at all prices, and in order to attract and maintain a good trade in these products the firm makes a specialty of being able to supply separate parts for all of the hubs listed. The frame sets and parts are sold at very reasonable prices and are up-to-date in character. The Hanna Cycle Material Co. acts as selling agent for the Thames Chain & Stamping Co., Duthie Chain Co., Mossberg Wrench Co., Brennan Handle Bar Co., Stockton Mfg. Co., Grand Rapids Bicycle Grip Co., Excelsior Needle Co. and the National Forge & Machine Screw Co.

**EUROPEAN AGENTS FOR GRANT TOOLS.**

The Grant Machine Tool Works, of Cleveland, is completing negotiations with Chas. Churchill & Co., Ltd., of London, whereby the latter will act as European agents for the product of the Grant factory.

**FAY & BOWEN RUSHED WITH WORK.**

Under date of February 20 the Auburn (N. Y.) Daily Advertiser says that one of the

busiest places in Auburn is the bicycle spoke and nipple factory of Fay & Bowen. This firm has found it necessary to their constantly increasing business to have the factory overhauled and enlarged, and even with these improvements they are now using every available inch of space, and recent additions to their machinery have compelled them to install an electric motor, which nearly doubles the motive power. They state they have been running night and day since September 1, and during December it was found necessary to run Saturday evenings until midnight to keep pace with orders. They have already booked contracts which call for nearly their entire estimated output for the season, and although their present production is about double that of a year ago, they report themselves unable to accumulate any stock ahead, immediate orders taking the goods as fast as finished.

**"INTERNATIONAL" CYCLE FITTINGS.**

In publishing the latest edition of its catalogue the International Cycle Fittings Co., 74 Reade street, New York city, calls atten-

tion to the fact that it continues its old policy of "cataloguing what it has and having what it catalogues." The line of goods handled by this firm is broad, including as stated in the advertising catch phrase employed, "Everything for bicycles." Specialties on which a vigorous hunt for business is being made are the Criterion and International hubs, Sandow tires, Oaks saddles and the "'99" and National pedals. The general construction and form of the last named is shown in the illustration herewith. The firm is also doing a first class business in frames and frame parts and is gaining no mean popularity for its Romeo and Juliet bicycles, which received much favorable comment at the recent New York cycle show as being high types of grace and structural merit for the prices at which they are sold.

**GOULDS AIR PUMPS FOR SHOPS.**

Air pumps are coming into more common use every day. A few years ago the use of compressed air pumps or anything of the kind was looked upon with considerable disfavor, and it was difficult to induce the ordinary business man to consider the use of compressed air. But now the use of air pumps is common in the dentist's office, where they play an important part; for the spraying of whitewash on tall buildings, etc., and the ordinary little air pump is even employed for many purposes in connection with large paintings, decorative work and the like.

The large illustration herewith shows one type of water jacketed air pump connected to and driven by an electric motor. This

outfit may be operated continuously, the water jacket preventing any possibility of the overheating of the cylinder, and the pump is strong enough to work against a pressure of 125 pounds. Such an outfit has been installed in some of the largest bicycle stores and shops, where it has not only served a most useful purpose but also attracts considerable attention, being something new.

Another type of air pump for hand use is shown in the smaller drawing. This is of course a smaller pump designed to work

against a pressure of not more than 100 pounds. Its long stroke and the compound lever render the work of operation comparatively easy.

These and many other styles of air pumps are built by the Goulds Mfg. Co., of Seneca Falls, N. Y., which has issued a very attractive and complete brochure on the subject.

**RACYCLE CATALOGUE UNIQUE.**

The Miami Cycle & Mfg. Co. of Middletown, O., has adopted a catalogue whose cover forms the mailing envelope and which shows marked originality in design. The cover is in imitation of a United States gold bond with the word Racycle worked into the scrolls and the Racycle trade mark displayed in the tinted open center. The corners of the imitated bond bear in the circles in which the valuation of the bond is commonly printed the prices of four of the leading Racycle models and at the bottom it is stated that "Gold bonds of the U. S. government pay interest semi-annually. The special Racycle narrow tread will pay you interest daily." The inner pages of the catalogue are devoted to illustrations and brief, simple descriptions of the important and distinctive mechanical features of the Racycle models and of the well known Racycle hanger. Short equipment specifications accompany the half-tone illustrations of the different patterns shown.

**U. S. BATTERY CO.'S ELECTRIC LAMP.**

The illustration below shows the construction and design of the new electric cycle lamp being manufactured by the United States Battery Co., having offices at 256 Dearborn street, Chicago, and 253 Broadway, New York city. The lamp is quite simple in construction and being self contained there are no outside wires or attachments for the

user to bother with. The storage battery is made in two parts, is small and comparatively light, and is incased in the vertical hollow shell, one section above the other. The batteries are kept from contact with the lamp body by the fiber lining of the latter but the lower section makes a direct connection with the lamp globe through the bottom screw cap and lamp shell, so that when the small fiber tipped button at the top is screwed down and the point of the incased wire leading to the carbon filament brought in contact with the upper battery section a complete current through the lamp is formed. It makes no difference which of the batteries is inserted first into the shell, the only caution being to keep the lamp upright. When the batteries have become exhausted they may be exchanged for freshly charged ones for a nominal cost.

The U. S. Battery Co. is rapidly establishing agencies in all cities so that users of the lamp may obtain charged batteries as readily as any standard cycle sundry. There are at this time more than sixty such agencies in New York city.

**INDEPENDENT SUPPLY CO.'S CATALOGUE.**

A complete catalogue of bicycle fittings and sundries has just been issued by the Independent Supply Co., 154 Lake street, Chicago. The material listed is representative stock of various well known and standard makes and the range of parts offered in frame building sets is so broad that the assembler purchasing from this house may erect almost any desired form of frame. It has always been the policy of the Independent Supply Co. to have in stock the goods which its patrons want and it has accordingly studied the market closely for several years with view to keeping in as close touch

as possible with the repairers and other small buyers. As a result, while the company has made no spectacular jumps toward prominence, it has enjoyed a steady increase in business ever since its birth and now it does not only a profitable business with small lot purchasers but in some lines of goods is favored with no small amount of large factory patronage. In this line the Independent expander is a notable example for which, it is stated, many large orders have been booked and which is meeting with great favor wherever it is introduced. The expander is familiar to the trade generally. It has but three distinct parts and when in place in the bicycle frame is entirely invisible with the exception of the operating nut.

#### VIM BICYCLES AT MODERATE PRICES.

The Vim Bicycle Co., 56 Fifth avenue, Chicago, which was one of the earliest advocates of popular prices, has issued a catalogue showing the nine patterns which compose the Vim line. All superfluous matter

has been eliminated from the catalogue and the reading matter has been confined strictly to brief, intelligent and honest descriptions of the bicycles. All of the patterns with the exceptions of Models B and D list at \$35 each. Model B is a man's road machine and sells at \$25 and Model D is the corresponding drop frame roadster. It sells at \$26. Of the \$35 machines Models 30 and 31 are catalogued as the leaders. They have Fauber hangers and flush joints and are equipped with such fittings as Baldwin chains, Brown and Gilliam saddles, etc. Models A and C have frames made from 1/4-inch tubing and are fitted with the Vim two-piece hanger shown in the accompanying illustration. Models 10 and 11 are three-crown frame machines and Model E is a 30-incher. In general construction and equipment these last three patterns are similar to Models A and C. On the last five machines Shirk pattern disk adjusting hubs are used. The regular tire equipment on the various models is the company's own single tube tire, which is fully guaranteed for one year and will be repaired free of charge during that time regardless of the cause of the trouble.

#### ACME MFG. CO. PROSPEROUS.

So busy is the factory of the Acme Mfg. Co. of Reading, Pa., turning out Stormer and Pennant bicycles, that the management states that the old time cycling spirit and selling vigor must have been revived. Some of the departments in this plant are running twenty-four hours a day. The Acme company also reports that it is both surprised and gratified to find that its orders are running very largely toward the stormer models rather than toward the cheaper patterns, thus showing that there will be plenty of buyers who are not looking for \$25 and \$35 machines. The Acme Mfg. Co.'s catalogue is a concise, tastily printed affair. It contains illustrations and specifications of two Stormer models at \$40 each, two Pennants at \$35 each, two Mars at \$25 each, a Stormer tandem at \$75 and juvenile Stormers ranging in price from \$20 to \$25 according to the size.

#### STRIPPED BICYCLES AT LOW PRICES.

The Wellington Wheel Works, 35 Randolph street, Chicago, which is managed by Charles L. Thayer, is offering the dealers of the country staunch, reliable cycles built on popular lines at exceptionally low prices, the machines being sold stripped, to be equipped with saddles, tires, pedals and tool bags to suit the purchasers. The machines bear the name plates of the manufacturers and are sold to but one dealer in each city or town. The different models are named the Atlas, Greenwood, Wellington and Hamilton. The Hamilton is the highest priced pattern and has a three-crown frame. The Wellington is made with either 28 or 30-inch wheels. A slight additional charge is made for ladies' machines. If desired the Wellington company will sell equipments of different grades at the lowest cash prices possible to purchasers of the stripped machines.

#### ADDITION TO WATERS PLANT.

F. S. Waters & Co., of Chicago, are building a two-story addition covering 80 by 50 feet of ground space in the rear of their present factory at 155 West Washington street. So pressed has the firm

been for room that it has been compelled to lease temporary quarters across the street from its plant, the rented building being used for shipping purposes. The new building when completed will be devoted to the interests of country trade with the purpose of enabling the company to make prompt shipments on all orders coming from its out of town patrons.

#### AMERICAN PIONEER IN TIRE MAKING.

One of the oldest manufacturers in point of experience in the tire business in this country is J. P. Langdon, president of the New Brunswick Rubber Co., who has been a rubber manufacturer for more than fifty years. The company was founded in 1839, and Mr. Langdon, entering its employ while a young man, has been continuously with the company for half a century. He has been its president for a number of years. Four years ago the company began making tires, and met with such success that it soon devoted its entire plant to this branch of manufacture. It is now making a very complete line of tires, in several different grades, with corrugated, rough and smooth tread. Its Regal tire, now in its third year, and its new Raritan tire, just brought out this year, have proved extremely popular.

#### SNOW WIRE WORKS' BIG PURCHASE.

The entire stock, dies, tools, goodwill, etc., of the Butler Mfg. Co. of Rochester, N. Y., have been purchased by the Snow Wire Works of the same city. The line of cycle sundries and bicycle holders made by the Butler Mfg. Co. has in the past been well received by the trade and in acquiring this business the Snow Wire Works adds greatly to the strength of its position among the manufacturers of wire and kindred sundries. One of the most popular articles in the Butler line is the adjustable wall cycle

holder. This holder is for general use, being very convenient in churches, stores, factories, halls and residences. It can be swung to any desired angle to the wall and is very small and light. Two finishes are furnished, the holders being either entirely japanned or made with a japanned back and nicked wire. The price is low and liberal discounts

are offered the trade, for whom the brackets are put up in display boxes holding one dozen.

#### THOR ECCENTRIC HANGER PATENTED.

The illustration below is a sectional view of the eccentric crank hanger manufactured by the Aurora Automatic Machinery Co. of Aurora, Ill., and marketed by the Iven-Brandenburg Co. of Chicago, a patent on which was last week allowed to Alex Levadahl of Aurora. The distinctive point in the bracket is the securing of the eccentric barrel. This is accomplished by an inclined cross bolt and sleeve which renders the exterior appearance of the complete hanger neater than it would be were the eccentric clamped by large exterior lugs and screws on

the bottom of the bracket. The inner sleeve is fitted with the regular Thor two-piece crank and axle group.

#### SELLING AGENTS FOR IMPERIAL FIXTURES.

The Iven-Brandenburg Co., with offices in New York, Chicago and Rochester, has the selling agency for the Imperial Co.'s entire output of Imperial Fixtures. All Iven-Brandenburg salesmen carry samples with them and a full stock of fixtures is carried in the company's stores in New York and Chicago, where all requests for prices, etc., should be sent to the Iven-Brandenburg Co.

#### FOOT CYCLING POPULAR IN ENGLAND.

W. S. Cleveland, manager of the Buffalo Foot Cycle Co., 985 Ellicott Square, Buffalo, reports that foot cycling as a pastime for men, women and children has become popular in England and that it is no rare sight over there to see persons gliding smoothly along prominent highways on the foot cycles. While the Buffalo Foot Cycle Co. advocates the establishment of foot cycling academies as profitable investments, it calls attention to the fact that its cycle skates

#### BICYCLE FITTED WITH BULLIS BALL-AND-CONE GEAR.

The illustration shows the outward appearance of the style of chainless bicycle which may be produced by fitting the gear marketed by the Bullis Ball Gear Company, of Rochester, N. Y. The gear as furnished to the manufacturing trade includes the one-piece hanger mechanism, the bracket encasing the front part of the gear and ready to be brazed to seat mast and lower front frame tube, the lower rear fork, the transmission shaft, the rear hub and complete sets of gears and pinions. The company states it has just completed a series of tests in regard to the running and wearing qualities of the gear in its latest form, in which the ball-rollers mesh with adjustable hollow cones on the engaging pinion. "A set of gears was run under normal load such as would be exerted upon it by a rider in climbing a 10 per cent grade at a speed of one mile per minute, for 100 miles continuously and at the expiration of that time the gears showed absolutely no heating and no wear that could be detected by use of a micrometer gauge. The gear was then run continuously for 1000 miles under the same load, and at a speed of 50 miles per hour with absolutely no further wear that could be detected." The method of taking up the wear between the pin and the roller is performed by tapering the pin and also the hole through the ball or cone, threading the ends of the pin in the supporting flanges; and by the simple act of tightening the pin with a screw driver, all wear at this important point is taken up.

must not be confounded with the old wooden roller skate. The company's "Cleveland" pattern cycle skate has but two wheels, which are each about two inches in diameter, mounted on ball bearings and fitted with rubber tires. The wheels being in line like those of a bicycle, propulsion on these skates is said to be delightful and convenient.

#### THE HENLEY LINE.

The Henley Bicycle & Roller Skate Works of Richmond, Ind., offer eleven models, as shown and described in their catalogue just issued, including the six patterns here illustrated.

Models 122, 124 and 126 are the company's standard road machines, and while embracing

Model 122—Standard roadster. Price, \$50.

Model 133—30-inch wheels. Price, \$50.

ing new points, still embody the valuable features which have heretofore been characteristic of Henley bicycles and especially of the men's high grade roadster. Frames are on the most approved, up-to-date lines. List price is \$50.

Model 133 is the medium grade men's roadster, with 30-inch wheels, two-piece crank axle and detachable sprockets. It lists at \$50.

Models 143 and 145 also belong to the medium grade line and list at \$45, but are fitted with 28-inch wheels. Otherwise they are the same as Model 133.

Models 150, 152 and 154 are ladies' machines, listing at \$50. These belong to the Standard

Model 143—Roadster. Price, \$45.

Model 152—Standard roadster. Price, \$50.

Model 172—Racer. Price, \$60.

roadster line and have improved lines. They are finely finished, elegant and graceful of pattern, and the only women's patterns made by the Henley works.

Models 172 and 173 are racing machines, listed at \$60. They have a new pattern, square drop forged fork crowns, 28-inch rear and 26-inch front wheels, with option on 30-inch rear and 26-inch front, and are claimed by the manufacturers to be constructed on perfect and practical racing lines.

The Duplex is built of the very best materials, in a substantial manner, and is sym-

metrical and elegant in appearance. As shown by the illustration, it is of entirely new design, thoroughly practical for the purposes intended, and has double drop frame, suitable for either men or women.

The cuts herewith show only six of the ten models which appear in the Henley catalogue, and these, with the other models, including diamond, combination and racing

The Henley Duplex.

tandems, form a most complete and desirable line of machines, most of them on new lines, and all with very best equipment, as shown in catalogue. Fairbanks-Boston rims and Indianapolis chains are used on all models, together with the latest patterns of Henley adjustable handlebars, except on racing machines, on which there is an option on fixed bars. As there is an imperative demand this season for square fork crowns, the Henley people have adopted a very desirable pattern, drop forged, but also give an option on arched crowns. All Henley bicycles have detachable sprockets.

#### CUPS AND CONES WELL LISTED.

One of the distinctive features of the catalogue of John R. Keim, of Buffalo, successor to the Spaulding Machine Screw Co., is the manner in which the various stock hub, hanger and head ball cups are illustrated and marked with dimension figures. So thoroughly and uniformly has the work been done that the manufacturer can tell without the slightest difficulty just what shells to order for his purpose. The same care is displayed in the illustration and description of the other stamped parts made by Mr. Keim, plain outline drawings which show the detailed construction of each part being used instead of pretty but less useful half-tones or wood cuts. The last few pages of the catalogue contain several tables intended to save purchasers of steel product much tiresome figuring. The tables include decimal equivalents of fractions of an inch; sizes and weights of flat rolled steel; weights of steel; bottom, pitch and outside diameters of sprocket wheels, and bicycle gears for 24, 26, 28 and 30-inch wheels and all combinations of sprockets.

#### MEYERCORD TRANSFERS LIKED.

As an instance of the approbation with which the Meyercord line of designs is being favored, it is only necessary to mention a few of the numerous testimonials received daily from the trade all over this country and from foreign lands by the company. Chas. L. Razoux, of Boston, writes: "Your new line of patterns I like first rate." Hull Brothers, of Gasport, N. Y., write: "Please send your new catalogue of transfer ornaments. We used your goods last year and liked them very much."

Any user of transfer ornaments—and almost every bicycle repairman and finisher has use for them—will find the Meyercord line of guaranteed transfers equal to, and the company positively claims better than, any other on the market. The main offices and factory of the Meyercord Co. are both located in Chicago, the former in the Chamber of Commerce building.

#### TOE CLIP BUYERS TO BE PROTECTED.
